7444. Eysenck, H. J. An application of the Maitland Graves Design Judgment Test to professional artists. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 589-590.—The Maitland Graves Design Judgment Test purports to distinguish successful students in schools of visual arts, and unsuccessful students and the general population. A previous study had thrown doubt on these claims, and in the present experiment 50 well qualified art students and professors were administered the test. Their mean score was slightly inferior to that of a student population, none of whom had received any art teaching. It is concluded that the test does not succeed in measuring what it purports to measure. *Journal abstract*.

7445. Hagaman, Walter H. (U. Virginia) A comparative investigation of four methods of testing when stimulus materials are presented by a visual medium. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4621.

7446. Hammill, Donald & Wiederholt, J. Lee. (Temple U.) Appropriateness of the Metropolitan Tests in an economically deprived, urban neighborhood. *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 49-50.

Investigated the appropriateness of the Metropolitan Achievement Test and the Metropolitan Readiness Test as measures of educational achievement of economically deprived urban children. A combination of low test reliabilities and high item difficulty led to the conclusion that these measures are to be used with caution with this type of child.—H. Kaczowski.

7447. Harries, James T. (State U. New York, Buffalo) The effects of visual and auditory distractibility factors on anxiety in a group test-taking situation. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4545.

7448. Hartlage, Lawrence C. & Lucas, David G. (Indiana U., Medical Center, Indianapolis) Scaled score transformations of Bender-Gestalt expectancy levels for young children. *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 76-78.—Describes a method for the transformation of Bender performance into scaled score equivalents. The efficacy of the scaled score transformation is given.—H. Kaczowski.

7449. Ivens, Stephen H. (Florida State U.) An investigation of item analysis, reliability, and validity in relation to criterion-referenced tests. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4548.

7450. Jay, Rutledge L. (U. Arizona) Development of a social competence scale. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4549.

7451. Kimbles, Samuel L. (U. Southern California) A measure of cultural deprivation. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4552.

7452. Koehler, Roger A. (State U. New York, Buffalo) A comparison of conventional choice testing and various confidence marking procedures with respect to validity. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4552.

7453. Krauft, Conrad C. (Southern Illinois U.) The effect of test taking procedure and level of risk taking upon multiple choice test score magnitude and reliability. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3960-3961.

7454. Lambert, Nadine M. (U. California, Berkeley) An item analysis and validity investigation of Bender Visual Motor Gestalt Test score items. *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 78-85.—Demonstrated the utility of standard item-analysis procedures for selecting the most reliable and valid items for scoring Bender Visual Motor Gestalt Test record. Data indicate that the score items that are most reliable and have the greatest discriminating power in predicting 7 and 10 yr. old Ss' behavior problems are not necessarily related to social status, ability level, or measured achievement.—H. Kaczowski.

7455. Mason, Evelyn P. (Western Washington State Coll.) Stability of differences in personality characteristics of junior high students from American Indian, Mexican, and Anglo ethnic backgrounds. *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 86-89.—Reports the results of the final testing of participants in Project Catch-Up. The data support the significant differences found among ethnic groups and between sexes in the earlier studies.—H. Kaczowski.

7456. Pandey, R. E. (Lincoln U.) The SCAT and race. *Psychological Reports*, 1971(Apr), Vol. 28(2), 459-462.—Investigated whether the School and College Ability Test (SCAT) is biased against black students. 33 white and 47 black graduating college seniors were studied. Significant differences in the mean GPAs and SCAT percentile ranks earned by whites and blacks demonstrate that the SCAT is not a biased test. However, the SCAT seems a better predictor for females than for males. *Journal abstract*.

7457. Paulus, Dieter H. & Renzulli, Joseph S. A factor-analytic study of the First Grade Screening Test. *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 57-59.—Investigated the empirical and rational structure of the First Grade Screening Test. The test is designed to sample handicaps that might impede school success. Expert opinion supported the rational determination of the individual test items. Empirical factor analysis suggests that for some items there is little relationship between the item and its rationally-derived category.—H. Kaczowski.

7458. Rankin, Larry M., (Hefnerbach, Stuart L. & Scoonover, Delmer L. (Iowa U.) A developmental study of PPVT temporal stability over two 6-mo. intervals. *Psychological Reports*, 1971(Apr), Vol. 28(2), 501-502.—Studied the temporal stabilities over 6 mo. of the various measures obtained on the Peabody Picture Vocabulary Test (PPVT) in 2 groups each of 17 kindergartners and 22 3rd graders. Test-retest within each kindergarten and 22 3rd graders intervened between administrations, the others were tested within the same school year. The correlations show age differences as well as the effects of the intervention of summer in the younger Ss.—*Journal abstract*.

7459. Reid, Wylmarie N. (U. Iowa) A comparison of the effects of pass-fail grading versus the effects of ABCDF grading on achievement, attitudes and

values. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4497.

7460. Rogers, Gilbert T. (Purdue U.) **Evaluation of three multivariate grouping techniques and biodata prediction of a multiple achievement-related personality criterion.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4975-4976.

7462. Skore, Marvin L. (Wayne State U.) **The use of the Bender Gestalt in assessing latent intellectual ability of culturally disadvantaged children.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3972-3973.

7463. Smith, Barbara A. (U. Massachusetts) **Identification of alternative forms of specific learning disabilities.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3792.

7464. Van Mondfrans, Adrian P., Feldhusen, John F., Treffinger, Donald J., & Ferris, Donald R. (Purdue U.) **The effects of instructions and response time on divergent thinking test scores.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 65-71.—Examined the effects of varying instructions and response time in testing for divergent thinking on both the level of performance and the intercorrelations of divergent thinking subscores with each other and with IQ. The Torrance Tests of Creative Thinking (TTCT) were administered to 319 public schoolchildren in Grades 5, 8, and 11 under 4 different conditions. Results indicate that variations in testing conditions change the magnitude and nature of scores obtained on the TTCT.—H. Kaczkowski.

7465. Williams, Clive. (U. Iowa) **The pervasiveness of cognitive preferences.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4565.

7466. Wolff-Albers, A. D. & Mellenbergh, G. J. **Nederlandse versie van de AVL.** [The Netherlands version of the AVL.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Nov), Vol. 25(10), 664.—Presents a short report on the relative validity of the Netherlands version of Allport, Vernon, and Lindzey's (AVL; see PA, Vol. 34:6747) Study of Values. The test purports to measure the theoretical, economic, aesthetic, social, political, and religious "basic values" of Ss. Item analysis of the results indicate acceptable reliability of the test. The instrument is apparently designed for usage in the middle grades to assist in student counseling.—A. J. Ter Keurst.

SPECIAL EDUCATION

7467. Buckley, Robert M. (Illinois Inst. of Technology) **A developmental study of the effect of perceptual training upon motor performance.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5016.

7468. Hornowska, Stanisława. **Psychologiczne problemy kształcenia i terapii dzieci odbiegających od normy w Stanach Zjednoczonych.** [The psychological problems of education and treatment of mentally retarded children in the United States of America.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 205-224.—Presents a report on the educational system in the

United States and the education and treatment of the emotionally disturbed, mentally retarded, and children with specific reading problems. Existing theories and their application in psychological and pedagogical practice are considered. The role of behavior therapy in the psychotherapy of maladjusted children is discussed. Detailed examinations of institutions in the United States which treat these children are presented. Similar methods of reeducation of dyslexic children in Poland are described. (Russian summary)—English summary.

7469. Warner, Dolores. (U. California, Los Angeles) **A phonetic reading program for exceptional pupils.** *Journal of the Reading Specialist*, 1968(Oct), Vol. 8(1), 32-43.—Studied a phonetic reading program for pupils who were emotionally disturbed, mentally retarded, and neurologically impaired. The phonetic reading program emphasizes the relationship between sounds and letters as they are encountered by pupils within whole words, rather than as isolated utterances. 19 7-14 yr. olds participated in the project. Criteria on which the effectiveness of the program was judged pertained to (a) confidence of pupils regarding reading, (b) attitude of pupil toward reading, (c) knowledge of the sound of the letters, (d) improvement in reading, and (e) overall benefit of participation in the experimental phonetic reading program. The emotionally disturbed and mentally retarded Ss as well as the girls and pupils younger than the median age of 8 yr. performed significantly better. The neurologically impaired pupils appeared to be at a greater disadvantage in the acquisition of phonetic reading skills than the others because of their handicap in the sensory processes. In primary grades, these pupils can make significant progress.—A. M. Farfaglia.

7474. Paoni, Frank J. (Oregon State U.) **Reciprocal effects of sixth graders tutoring third graders in reading.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3993-3994.

7475. Ullmann, Charles A. (Dept. of Health, Education, & Welfare, Arlington, Va.) **Prevalence of**

reading disability as a function of the measure used. *Journal of Learning Disabilities*, 1969(Nov), Vol. 2(11), 556-558.—Proposes that the "years below grade" formula conventionally used to define reading disability (a) operates in an irregular manner, and (b) gives a picture of disability which is difficult to distinguish from normal variation in human ability. The use of this formula also causes the prevalence of reading disorders to appear larger as years of schooling increase. Other measures which may give a more conservative estimate of the prevalence of disability and may be more significant are suggested.—*Journal abstract*.

Sensory & Physical Handicaps

7476. Barkuloo, Herbert W. (U. Pittsburgh) **The effect of control of the physical environment of the classroom on the distractibility of deaf children.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4582.

7480. Conine, Tali & Brennan, William T. (Indiana U., Medical School) **Orthopedically handicapped children in regular classrooms.** *Journal of School Health*, 1969(Jan), Vol. 39(1), 59-63.—Directed the attention of the classroom teacher to health and safety aspects common to many orthopedically disabled pupils. The teacher is responsible for the pupil's physical and emotional health. The temporarily disabled child has a greater tendency to forget his limitations. Environmental considerations, e.g., railings, seat belts, comfortable clothing, hygiene conditions for lowered resistance; casts; crutches; canes; braces; artificial limbs; and wheel chairs are studied along with the particular requirements commonly prescribed. The teacher must assume an active role in the rehabilitation of the handicapped child by being a source of information to the medical team and a promoter of physical and emotional health and safety of the disabled student.—*A. Farfaglia*.

7482. Lewis, Marian & Coker, Gary. (Tennessee School for the Blind, Donelson) **The use of abacus contests to increase interest in mathematics.** *New Outlook for the Blind*, 1971(Feb), Vol. 65(2), 41-48.—1 of the problem areas of learning for sightless students, the arithmetic, led a school for the blind to introduce the Cranmer abacus method in their curriculum. Teachers attended a course in this method, underwent inservice training, utilized new textbooks, and made abacus

learning a game by arranging an abacus bee, an intramural abacus contest and one between sightless and sighted students with abacus and paper-and-pencil methods. The Cranmer abacus has proved to be the most effective computational tool leading "to a high degree of motivation, more effective conceptualization and increased speed in computation." The contests facilitated practice in use of the abacus and in creating more interest in it. Team selections, organization, rules for competition, and sample sheet score of the game methods are included.—*M. J. Stanford*.

7483. Lokerson, Jean E. (U. Maryland) **An investigation of visual perception and the psycholinguistic process: The comparative performance of first grade boys on the Illinois Test of Psycholinguistic Abilities and the Illinois Test of Psycholinguistic Abilities adapted for visual-perceptual impairment.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3992-3993.

7484. Markides, A. (U. Southampton, England) **The speech of deaf and partially-hearing children with special reference to factors affecting intelligibility.** *British Journal of Disorders of Communication*, 1970(Oct), Vol. 5(2), 126-140.—Selected 58 deaf, 27 partially-hearing, and 25 normal 7- and 9-yr-old children from 6 schools. Ss completed 3 linguistic tests, an articulation test, and a speech intelligibility test. Significant inter-group differences were found for all tests with the normals performing better than the hearing-impaired, and the partially-hearing performing better than the deaf. Deaf Ss were 4-5 yr. and partially-hearing Ss were 2-3 yr. retarded in their vocabulary age, and this retardation increased with age. Older deaf Ss scored higher on intelligibility than younger deaf Ss, but this relationship was reversed in the partially-hearing. Boarding Ss did as well or better than day Ss on all tests. These findings and results from a questionnaire on speech education completed by 18 of the Ss' teachers are discussed. It is concluded that apart from inherent characteristics of the children, e.g., degree of hearing loss, the main factors which influence speech intelligibility "were the speech environment and level of educational aspiration set by each school, the degree and efficiency with which hearing aids were used and ... formal individual and group speech training." (22 ref.)—*S. Knapp*.

7485. Rasmussen, P. Vestberg. **Høreskadede børns læsefærdighed.** [Reading of hard-of-hearing children.] *Skolepsykologi*, 1970, Vol. 7(1), 17-25. A silent-word-reading test (OS 400) shows that hard-of-hearing children have a high frequency of reading errors. Discussed are the possible implications of this when screening for language problems among young schoolchildren. *P. Mylov*.

7502. Goodwin, Lane A. (U. Utah) The effects of two selected physical education programs on trainable mentally retarded children. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3933.

7503. Gruber, Joseph J. (U. Kentucky) Implications of physical education programs for children with learning disabilities. *Journal of Learning Disabilities*, 1969(Nov), Vol. 2(11), 593-599.—Reviews theories on the integrated development of the child and research on normal and learning disabled children. It is suggested that physical education and recreation can contribute to the education of handicapped children. Psychologically, every child needs successful play experiences to develop a body image or self-concept. The development of knowledge and competencies in games, dancing, hobbies, nature, and sports can improve the general functioning of the handicapped in society. Specifically, physical education can contribute to the child's physical development, level of recreational skills, emotional development, intellectual achievement, and social competencies. (30 ref.)—*Journal abstract*.

7509. Keogh, Barbara K., et al. Early identification of children with potential learning problems. *Journal of Special Education*, 1970(Sum), Vol. 4(3), 307-365.—Provides an overview with respect to identification of learning problems in 4 areas: physical-motor factors presented by M. Leydorf and discussed by R. Schain, perceptuomotor factors presented by K. Wedell and discussed by J. Switzer, cognitive and language factors presented by M. Faust and discussed by C. Stern, and emotional-social factors presented by J. Call and discussed by L. Liverman. Also, included are a general introduction and a general summary discussion. It is emphasized that: (a) the child and the environment are always in an interactive situation and both must be considered in diagnosis and treatment, and (b) there is a necessity for recognition of individual differences even at an early age. It was particularly stressed that the child must always be treated as a unique individual rather than as one in a large category. Although it was generally agreed that the variables are complex, there was optimism that research is making advances in identifying those characteristics which could then be modified to prevent later learning problems in children.—L. M. Glidden.

7513. Mitchell, Marlys M. (U. North Carolina, Chapel Hill) Analysis of Welsh Figure Preference Test scores of educable mentally handicapped children. *Training School Bulletin*, 1971(Feb), Vol. 67(4), 214-219.—Administered the Revised Art Scale (RA) of the Welsh Figure Preference Test (WEPT) to 183 intermediate-level special class educable mentally handicapped (EMH) children, to 48 normal 2nd graders, and to 47 normal 6th graders, all enrolled in public schools, to evaluate the responses of the EMH group in terms of sex, CA, MA, and IQ, and to compare these responses with scores of 2nd and 6th grade Ss. EMH children scored significantly lower than 6th graders equal to EMH Ss in mean CA, on both the RA and Don't Like (DL) Scales ($p < .001$ and $p < .01$, respectively), but were not significantly different from 2nd graders equal to EMH Ss in mean MA. A significant difference in scores of the EMH boys and girls was found on the RA Scale ($p < .05$) but not on the DL Scale. No significant differences between scores of the boys and girls in Grade 2 or in Grade 6 were found.—*Journal abstract*.

7520. Shapiro, Lillian P. (Columbia U.) Some factors affecting the ability of retarded children to discriminate between the letters "b" and "d." *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3994-3995.

7521. Shipe, Dorothy & Miezitis, Solvelga. (U. Ontario, Inst. for Studies in Education, Toronto, Canada) A pilot study in the diagnosis and remediation of special learning disabilities in preschool children. *Journal of Learning Disabilities*, 1969(Nov), Vol. 2(11), 579-592.—Examined (a) the feasibility of early identification of the perceptually-handicapped, and (b) the effectiveness of 2 remedial programs. 5 male and 2 female 4-6 yr. olds were selected from children referred to a clinic for possible perceptual handicaps. 4 Ss were assigned to a remedial program emphasizing language and cognitive development, and the others to a program focusing on visual-motor functioning. Ss attended the training programs for 2-4 mo. Results indicate that, because of emotional disturbance, immaturity, and great variability between cases, it was difficult to apply the label of perceptual handicap at so early an age. The type and degree of improvement bore little relationship to the type of program. A research strategy in which each child is used as his own control and the treatment is individually prescribed is suggested. (24 ref.) —*Journal abstract*.

Jensen's (see PA, Vol. 44:14314) theory of intelligence, focusing on the education of borderline children in the schools.—P. Mylov.

7527. Stavrianos, Bertha K. (National Coll. of Education, Evanston, Ill.) **Can projective test measures aid in the detection and differential diagnosis of reading deficit?** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 80-91.—Comparison of Bender Gestalt Test, House-Tree-Person Projective Technique, and Rorschach test measures for good readers, and 3 types of poor readers among 325 6-11 yr. old socioeconomically advantaged boys indicated that high organic, constricted scores, and immature Rorschach patterns characterized poor readers. Lower organic scores and expansive reactions suggested emotional deficit. Withdrawn, constricted, dependent patterns, and high F- suggested specific deficit. Combined scores identified deficit and differentiated between emotional and specific deficit for 98%, and between organic and nonorganic deficit for 90% of cases. Projective tests can aid in diagnosis of reading deficit. (20 ref.)—*Journal abstract*.

7529. Upson, P. G. (Tavistock Clinic, London, England) **The psychodynamics of reading disability: A pilot study.** *British Journal of Projective Psychology & Personality Study*, 1968(Dec), Vol. 13(2), 15-21.—Considered in detail the psychodynamic approach to the problem of reading disability, and subjected to experimentation 1 version of the underlying dynamics which may be involved. The importance of distinguishing between cases where emotional disturbance is the result of the reading disability and those where it is

the cause is emphasized, for reading disability can be viewed as a genuine neurotic symptom. The viewpoints of various psychiatrists and psychologists regarding the psychodynamic approach are considered. The following hypothesis is investigated: Is the father perceived by the male backward reader as weak and/or damaged? A detailed examination of 25 case files of backward readers was carried out and covered 2 areas: aggression, and parental roles. A control group (N = 12) of primary school boys of average intelligence and an experimental group (N = 8) of boys from remedial classes served as Ss. Ss were given a tachistoscopic recognition test, consisting of 12 pictures with each depicting a father, mother, and young boy in some kind of family situation. A 3rd group (N = 4) of boys who also were backward readers was included for comparison purposes. It is concluded that while clinical data offer some support for the hypothesis, the experimental pilot study did not produce any clear-cut evidence either way. Results do suggest that a "developmental arrest in the symbolization process . . . might play an important part in the aetiology of reading disability." (20 ref.)—A. Farfaglia.

Emotional Disorder

7530. Chew, Harold R. (U. Pittsburgh) **Using operant conditioning and contingency management in teaching arithmetic.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4583-4584.

7533. Saunders, Bruce T. (U. Maine) **The effect of the emotionally disturbed child in the public school classroom.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 23-26.—Tested the premise that treatment of emotionally disturbed children within the public school classroom is seriously curtailed by what Redl labels "germophobia" (group contagion). 3 groups of 4th, 5th, and 6th graders of varying degrees of social acceptance were so placed in social studies classes that the presence of behavioral contagion could be observed. The analysis of data indicated no significant difference between or among treatments.—H. Kaczowski.

7534. Urda, Michael A. & Snyder, Marjorie S. (Kent State U.) **The maladjusted reader: Whose responsibility?** *Journal of the Reading Specialist*, 1968(Dec), Vol. 8(2), 66-72.—Outlined an approach to emotionally maladjusted readers used at an educational child study center. The case of a 17-yr-old boy with average intelligence and reading level of 5th grade is illustrated. The S is passed from 1 school service to another. But each service deals with the child from its particular viewpoint; his maladjustment is never dealt with as a whole. The reading staff with the encouragement of the referring psychologist at the center was able to deal with the modification of the 3 problem areas of the maladjusted reader: change of specific characteristics in behavior, increase of reading ability, and assistance in interpersonal relations. Reducing the S's anxiety level was the 1st step to any real progress in reading. The

interdisciplinary team approach presents the most logical and effective approach in dealing with an emotionally disturbed child's disabilities. The reading teacher is the focal point.—A. M. Farfaglia.

COUNSELING & GUIDANCE

7536. Allen, George J. (U. Connecticut) **Effectiveness of study counseling and desensitization in alleviating test anxiety in college students.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 282-289. —Selected 36 male and 39 female test-anxious undergraduates. 50 Ss were assigned randomly to 1 of 2 therapists for (a) desensitization alone, (b) study counseling alone, (c) a combination of study counseling and desensitization, and (d) a placebo procedure. 25 Ss were assigned to 2 control groups. The experimental design was a repeated-measures paradigm involving pre- and posttreatment assessment of self-report, physiological, and academic performance variables. Data were collected during an interview and immediately before midterm and final examinations. Results indicate that a combination of desensitization and study counseling was more effective in reducing physiologically measured anxiety and improving academic and examination performance than either technique alone. Desensitization and study counseling were not reliably different from each other, nor reliably more effective than the placebo procedure in improving academic performance. (29 ref.)—*Journal abstract*.

7551. Gamsky, N. R. (Cooperative Educational Service Agency No. 13, Waupun, Wis.) **Action research and the school counselor.** *School Counselor*, 1970(Sep), Vol. 18(1), 36-42. —In achieving its major goal, action research is basically oriented toward immediate and practical conclusions for specific situations rather than toward broad principles. Discussed are: (a) the nature of research and research models, (b) evaluation vs. research, (c) theory and criterion problems, (d) imple-

mentation of research and utilization of findings, (e) action research vs. traditional research, and (f) contrasting major emphases in action research. In any research, 3 key steps are involved: (a) formulating hypotheses; (b) implementing, testing, and converting ideas to reality; and (c) assessment and evaluation. The last, most crucial step has been virtually ignored.—S. M. Amatora.

7552. Gamsky, Neal R. & Lloyd, Faye W. (Cooperative Educational Service Agency No. 13, Waupun, Wis.) **Relationship of classroom behavior to visual perceptual deficiencies.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 60-61.—Scores on the Frostig Test of Visual Perception and the Maryland Pupil Classroom Behavior Scale were used to determine whether 409 kindergartners with perceptual learning difficulties also exhibit poor classroom adjustment. Positive significant correlations were found to exist among pupil behavior assessment and Frostig Subtests 2, 3, 4, and 5, and the composite Perceptual Quotient.—H. Kaczowski.

7553. Gayton, William F. **An evaluation of two short forms of the Stanford-Binet, Form L-M, for use with a child guidance population.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 355-357.—Examined the validity of the Terman-Merrill and Wright short forms of the Stanford-Binet, Form L-M. Both forms manifested a high degree of statistical correspondence with the full-scale Binet when used with 50 male 5-14 yr. old child guidance clinic patients. When a practical analysis was conducted, the abbreviated forms manifested certain deficiencies in predicting an individual's IQ classification.—*Journal abstract*.

7554. Geoghagan, James L. (U. Tennessee) **An action approach to group counseling: An experimental study.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4458.

7556. Goldstein, Harris S. & Peck, Rosalind. (State U. New York, Downstate Medical Center) **Cognitive functions in Negro and white children in a child guidance clinic.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 379-384.—Studied the IQs of 52 Negro and 40 Caucasian children attending an inner-city child guidance clinic. Scores on the WISC and the Goodenough-Harris Drawing Test (Draw-A-Man) were compared. Caucasian males ($n = 22$) scored significantly higher ($p < .001$) than Negro males ($n = 34$) only on the verbal part of the WISC. The similarities score of Negro males with low vocabulary scores was significantly higher ($p < .001$) than their vocabulary scores. Caucasian females ($n = 18$), however, achieved significantly higher scores ($p < .001$) than Negro females ($n = 17$) on verbal, performance, and full scale IQs as well as on the drawing test. The differences in presenting symptomatology of Negro and Caucasian girls is seen as a determinant of these cognitive differences.—*Journal abstract*.

mental health criteria for elementary school children: An organizational and curricular approach. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4552-4553.

7570. Lewis, M. D. (Florida Atlantic U., Boca Raton) **Elementary school counseling and consultation: Their effects on teachers' perceptions.** *School Counselor*, 1970(Sep), Vol. 18(1), 49-53.—A representative sample of 3rd graders referred by their teachers were divided into 5 groups for a 12-wk experimental period. Pre- and posttests were administered to the teachers. These were forms containing 12 components of personal and social adjustment on which they rated the pupils on a 1-4 scale, and the Achievement-Oriented Behavior Scale, devised for the study to measure the work attitudes and skills associated with school achievement. The teacher rated each of the 15 variables on a 5-point scale. The null hypothesis was rejected since significant differences were found at the .05 level.—S. M. Amatora.

7571. Light, Louise L. & Alexakos, C. E. (Bluefield High School, W. Va.) **Effect of individual and group counseling on study habits.** *Journal of Educational Research*, 1970(Jul), Vol. 63(10), 450-454.—Randomly assigned 30 10th graders matched for IQ, socioeconomic background, and curriculum load to 3 treatments: (a) group counseling, (b) individual counseling, or (c) control. Pre- and postcounseling scores of Ss on Wrenn's Study Habits Inventory (SHI), teacher analysis of Ss' behavior on a 20-item scale, and Ss' grades were analyzed. Counseled Ss showed improved SHI scores, English grades, and ratings by teachers of English, science, and social studies. Geometry grades for counseled Ss remained the same, but for uncounseled Ss they deteriorated. Inter-group differences were significant for SHI scores, geometry grades, and ratings by English and geometry teachers. The sensitivity and reliability of the teachers in evaluating behavior and performance changes are discussed.—*Journal abstract.*

7572. Loughary, J. W. & Bowman, C. W. (U. Oregon) **Guidance information systems.** *School Counselor*, 1970(Sep), Vol. 18(1), 43-48.—Utilization of systems technology would be useful in improving the information aspects of counseling and guidance. A systems analysis approach involves: (a) determination of desired output of the system in operational terms, (b) identification of assumptions, (c) specification of input, (d) analysis of functions prior to assignment to person or machine, (e) statement of processes involved in relatively small components, and (f) evaluation of outcomes in terms of stated objectives. The systems approach increases the possibility of continued development and refinement of the system on a component by component basis.—S. M. Amatora.

7585. Scott, C. Winfield. (Rutgers State U.) **Changes in follow-up data following marked changes in a counselor education program.** *Counselor Education & Supervision*, 1970(Spr), Vol. 9(3), 195-204.—Compares follow-up data for 2 groups of master's degree alumni of a counselor education program, 1 of which graduated before marked changes in the program occurred and the other thereafter. The questionnaire data represented 83.5% (N = 167) of the 1st group and 89.6% (N = 121) of the 2nd. Findings concerning the instructional program, advisement, and library services show significant improvement in appraisal reactions of alumni in 6 of 12 cases, some deterioration in 1, equivocal results in another, and no change in 4. Employment data show an increase from 42-71% of alumni in counseling and guidance positions. Professional membership data reveal

a significant trend toward identification with national organizations. It is concluded that significant changes in much follow-up data occurred after marked changes in the counselor education program and that these changes were generally in the direction of further professionalization of counseling and guidance.—*Journal abstract.*

7617. Brody, Ernest B. (Rutgers State U.) **A note on the validity of the Minnesota Teacher Attitude Inventory (MTAI).** *Journal of Educational Research*, 1970(Oct), Vol. 64(2), 67.—Classified 1,863 secondary school students into 2 groups: (a) Ss who planned to attend college, and (b) Ss who did not plan to attend college. Ss then rated 16 male and 25 female student teachers on a 5-point scale. These ratings were compared with the scores of the student teachers on the Minnesota Teacher Attitude Inventory (MTAI). Student teachers who scored high on the MTAI were rated more favorably by Ss who did not plan to attend college. Results are discussed as supporting the hypothesis that high scorers on the MTAI are judged more favorably by affectively than cognitively oriented students. Findings suggest the importance of considering the type of pupil with whom a particular kind of teacher might be most effective.—*Journal abstract*.

7627. Funk, C. Dennis & Carter, G. L. (Utah State U.) **The relationship between dogmatism scores and performance ratings among adult educators.** *Adult Education*, 1971(Win), Vol. 21(2), 46-55. Collected data by mail questionnaires from 486 out of 503 county extension workers with major responsibility for adult education programs in agriculture in 5 states. Dogmatism was measured by the Rokeach Dogmatism Scale (Form E) included in the questionnaire. Performance was determined by supervisor ratings using the paired comparison technique. Results indicate a slight negative relationship ($\gamma = .19$) between dogmatism and performance. This relationship was affected by the age and education level of the respondents. Open-minded Ss tended to be rated higher in performance than close-minded Ss. The use of the scale for screening potential personnel is considered.—*Journal abstract*.

7635. Hiller, Jack H. (Southern Illinois U.) **Verbal response indicators of conceptual vagueness.** *American Educational Research Journal*, 1971(Jan), Vol. 8(1), 151-161.—Verbal response measures designed to represent a construct termed vagueness were found in previous studies to correlate negatively both with student essay grades and with measures of teacher lecturing effectiveness. This experiment attempted to test the hypothesis that vagueness response frequency is inversely related to the communicator's command of knowledge. For the experiment, lecturers were given either a high- or low-knowledge lesson, and then were given relatively long or short periods of preparation before delivering their lectures. Vagueness was found to be higher in the low-knowledge group ($p < .005$), but no difference was found between preparation groups. A t test for scores on lesson comprehension tests given to each lecturer after his preparatory lesson further demonstrated the effectiveness of the knowledge treatments ($p < .05$, $N = 24$). In addition, a negative correlation between these test scores and the Ss' levels of vagueness ($r = -.33$, $p < .07$) supported the hypothesis.—*Journal abstract*.

7670. Yee, Albert H. & Fruchter, Benjamin. (U. Wisconsin) **Factor content of the Minnesota Teacher Attitude Inventory.** *American Educational Research Journal*, 1971(Jan), Vol. 8(1), 119-133. Factor analyses of the Minnesota Teacher Attitude Inventory's (MTAI) 150 items were conducted to test the hypothesis that the MTAI contains more homogeneous and unidimensional measures of teachers' attitudes than are represented by the total score. A series of analyses applied to 368 MTAI responses of intermediate grade teachers with various computer programs, yielding a number of alternative analyses, resulted in the selection of a solution with 5 interpretable and meaningful factors, identified as: (a) children's irresponsible tendencies and lack of self-discipline, (b) conflict between teachers' and pupils' interests, (c) rigidity and severity in handling pupils, (d) pupils' independence in learning, and (e) pupils' acquiescence to the teacher. Their interpretation and significance for the psychological study of teacher behavior are discussed as well as comparison with earlier work by Horn and Morrison. (25 ref.)—*Journal abstract*.

SCHOOL LEARNING & ACHIEVEMENT

7671. Alexander, Larry; Elsom, Bill; Means, Robert, & Means, Gladys. (Oklahoma State U.) **Achievement as a function of teacher-initiated student-teacher personal interactions.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 431-434.—Rank ordered 40 undergraduates by past GPAs. The median break technique was used to form a high- and a low-GPA group. Ss within each of these groups were then randomly assigned to 2 treatments: Treatment I Ss were treated politely by the instructor but with no personal interest. Treatment II Ss were referred to by name, and the instructor initiated discussion with them. A 2×2 analysis of variance design was employed to analyze student performance on the 1st teacher-made achievement test. Treatment II Ss achieved significantly higher scores than did Treatment I Ss. High-GPA Ss achieved significantly higher scores than did low-GPA Ss. The interaction was not significant although treatment appeared to have a greater effect on low- than on high-GPA Ss.—*Journal abstract.*

7673. Berman, Graham & Eisenberg, Mildred. (Queen Elizabeth Hosp., Montreal, Quebec, Canada) **Psychosocial aspects of academic achievement.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 406-415.—Reviews some previous work on factors in academic achievement and reports a study using 270 final-yr high school students which correlates final-yr grades with IQ, family and socioeconomic data, and CPI scores in order to define the characteristics of the successful student within a culturally and economically homogeneous group. Certain personality traits were found to correlate with achievement, i.e., motivation, sense of well-being, independence, and conformity. Exceptionally high achievement correlated with high IQ, and it is suggested that identification with parents' values and life modes may be relevant. (24 ref.)—*Journal abstract.*

7674. Blanchard, Robert W. & Biller, Henry B. (Cape Cod Child Guidance Clinic, Pocasset, Mass.) **Father availability and academic performance among third-grade boys.** *Developmental Psychology*, 1971(May), Vol. 4(3), 301-305.—Divided 44 3rd grade boys matched for age, IQ, socioeconomic status, and presence or absence of male siblings into 4 equal groups: (a) early father-absent (beginning before age 5), (b) late father-absent (beginning after age 5), (c) low father-present (less than 6 hr/wk), and (d) high father-present (more than 2 hr/day). Class grades and academic achievement test scores were examined. The academic performance of the high father-present group was very superior to the other 3 groups. The early father-absent boys were generally underachievers, the late father-absent and low father-present boys usually functioned somewhat below grade level, and the high father-present group performed consistently above grade level. The relationship between father availability and motivation is discussed. (18 ref.)—*Journal abstract.*

Western Ontario, London, Canada) **The effect of kindergarten experience upon IQ test performance.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 62-64.—Investigated the relationship between IQ, kindergarten attendance, and social class. Results indicate that the kindergarten experience has a positive influence on test performance. Children from the lowest social classes profited the least from kindergarten experience.—*H. Kaczowski*

7678. Caffrey, Bernard & Klugh, Tom. (Clemson U.) **Effect of Saturday classes on grades and attendance.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 581-582.—Investigated the suggestion that lower grades are obtained by students who attend classes which meet on Saturday morning and that these low grades might be related to the tendency to "cut" Saturday classes. Data was collected from 605 undergraduates in Saturday classes and 332 undergraduates in weekday classes. There was a significant relationship ($p < .05$) between cuts and grades in both groups. Ss who cut more classes tended to make lower grades. The mean number of cuts for the weekday classes was 2.32; that for the Saturday classes was 2.22. Ss in the Saturday classes obtained higher grades ($p < .05$). Other variables affecting Saturday class attendance are discussed.—*Journal abstract.*

7682. Carver, Ronald P. (American Inst. for Research, Washington, D.C.) **A test of an hypothesized relationship between learning time and amount learned in school learning.** *Journal of Educational Research*, 1970(Oct), Vol. 64(2), 57-58.—Tested the hypothesis proposed by J. Carroll (see PA, Vol. 37:8222) that the degree of learning, other things being equal, is a simple function of the amount of time during which the pupil engages actively in learning. Classroom examinations, intelligence test scores, and hours of study time reported by 48 introductory psychology students were evaluated. When learning ability was controlled, the correlation between amount learned and learning time was statistically significant. Considering the attenuating effects of the indicants, it is concluded that learning time is a highly important variable which should be taken into account in investigations of classroom learning.—*Journal abstract.*

7697. Hersen, Michel & Sudik, Ellen. (Fairfield Hills Hosp., Newtown, Conn.) Verbal conditioning as related to awareness and grade point average. *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 266-269.—80 female high school students, divided into high and low GPA groups and aware and unaware groups, were administered a verbal conditioning task. Similar I-We response increments over 80 trials were obtained for both groups. High GPA Ss did not have a higher proportion of aware Ss than low GPA Ss. Aware Ss, regardless of their GPA classification, revealed increments in their performance over the 4 trial blocks. "The conclusions are that (a) grade point average is unrelated to performance increments or the Ss ability to become aware of the experimental arrangements on the Taffel conditioning task, and (b) awareness of the response-reinforcement contingency is what the S primarily learns in the Taffel verbal operant conditioning paradigm." The results gave support for the cognitive-mediational position in verbal conditioning.—E. J. Kronenberger.

7709. Kokosh, John. (U. Minnesota) **Two-point MMPI code types and academic achievement.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 671-676. —Attempted to relate the 2-point MMPI code types of 128 male graduates to academic achievement. The highest GPA was obtained by 5 physics-zoology majors having the 27-72 code, and the lowest GPA was obtained by 7 sociology-history majors having the 89-98 code. Questions as to why certain code types are attracted more to 1 major than another and why they perform well or poorly in 1 major as compared to another are discussed. It is suggested that a study of personality types and the relation of these to academic and vocational behavior may be a fruitful approach rather than using personality traits alone as measured by particular scales.—*Journal abstract*.

Niebrzydowski, Leon. **Analiza cech osobowości uczniów o różnym poziomie osiągnięć szkolnych.** [The analysis of personality traits in pupils of various standards.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 177-189.—Administered the Institute for Personality and Ability Testing High School Personality Questionnaire to 42 very good, 26 average, and 31 poor 6th-8th grade students. Good students were distinguished as having (a) strong superegos, (b) ingenuity and self-sufficiency, (c) self-respect, (d) emotional maturity and strong egos, (e) self-control, and (f) gentleness. Poor students were distinguished as being (a) impatient, (b) subjective, (c) demanding attention, (d) emotional and easily frustrated, (e) inclined to guilt and depression, and (f) inclined to capricious and neurasthenic tempers. The decisive differentiating factor was that which indicates high intelligence for the good Ss and low for the poor Ss. Average Ss differed from other Ss only in factors indicating stubborn adherence to aspirations and opinions, self-assurance, and independence. (Russian summary)—*English summary*.

7728. Schmidt, H. E. (National Inst. for Personnel Research, Johannesburg, South Africa) **Note on the relationship between academic success, creativity and motivational factors in architecture students.** *Psychologia Africana*, 1970(Oct), Vol. 13(2-3), 209-214.—Investigated the relationships between academic success, creativity, and motivational factors. 33 1st-yr architecture students completed (a) the Seeing Faults Test, a measure of creativity; (b) the MA scale; (c) the Continuous Coded Addition Test (CCAT), a measure of perseverance and similar aspects of work motivation; and (d) a newly constructed Work Attitude Scale (WAS). The intercorrelations between the MA scale, the WAS, and the CCAT indicate that these tests all measure some aspect of motivation. No correlation was found between these measures and the creativity test. Academic success correlated highly with the WAS and with some parts of the CCAT indicating that both scales would be useful tools for the prediction of academic success.—*Journal abstract*.

7730. Shaw, Ralph L. & Uhl, Norman P. (Emory U.) **Control of reinforcement and academic achievement.** *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 226-228.—Investigated the relationship between children's locus of control scores and school achievement, as measured by reading scores, for low and upper-middle socioeconomic level (SEL) white and black groups. It was found that (a) the low SEL group (N = 104) had significantly higher external scores than the upper-middle SEL group (N = 107), and (b) that within the upper-middle group the blacks had higher external scores than the whites. However, within the low group, there was no relationship between race and external scores. Of the 4 groups, white low SEL, black low SEL, black upper-middle SEL, and white upper-middle SEL, the locus of control scores related to success in reading in only the latter group. It was found that the higher the external score, the lower the reading score. Findings are discussed in terms of their educational implications.—*Journal abstract*.

7752. Solomon, Daniel; Scheinfeld, Daniel R., Hirsch, Jay G., & Jackson, John C. (Inst. for Juvenile Research, Chicago, Ill.) **Early grade school performance of inner city Negro high school achievers, low achievers, and dropouts.** *Developmental Psychology*, 1971(May), Vol. 4(3), 482.—Examined the hypothesis that high school completion and achievement level could be predicted from 3rd and 4th grade subject and conduct averages in a group of black inner city adolescents. Ss were (a) 37 male and female high achievers (HAs), (b) 41 low achievers (LAs), and (c) 47 dropouts. Averages significantly differentiated between male HAs and LAs and between female LAs and dropouts. No differences were found for male LAs and dropouts or for female HAs and LAs. Differences between HAs and dropouts were significant, especially for females. Later elementary records revealed the same patterns for the males, while by the 5th grade, female HAs and LAs were differentiated. 6th grade IQ scores revealed significant differences for females but not for males. Results suggest that "dropping out is more related to academic skill and ability for girls than for boys."—S. Knapp.

7753. Stevens, Norma Y. (U. Georgia) **A longitudinal study of biographical, intelligence, and personality variables in predicting achievement of Mexican theological students.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4564.

7754. Tobiesen, Jon; Duckworth, Barbara, & Conrad, W. Glenn. (Schenectady County Child Guidance Center Inc., N.Y.) **Relationships between the Schenectady Kindergarten Rating Scales and first grade achievement and adjustment.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 29-36.—Summarizes an evaluation of the predictive efficacy of the Schenectady Kindergarten Rating Scales (SKRS). These scales are designed to identify children who are deficient in language, motor, cognitive, or social development. Results suggest that the SKRS is effective in identifying children who are likely to have learning or impulse control problems in the 1st grade.—H. Kaczowski.

Overachievement & Underachievement

7755. Bailey, Roger C. (Concord Coll.) **Self-concept differences in low and high achieving students.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 188-191.—Investigated differences in self-perceptions between 50 achieving college Ss and 50 underachieving

college Ss with below average college ability. The achieving Ss had (a) higher self-ratings on college ability, (b) higher desired levels of college ability, (c) smaller discrepancies between perceived and wished for levels of college ability, and (d) smaller discrepancies between their perceived and actual level of college ability than the underachieving Ss. "The results strongly suggest that a student's self-perception of his academic ability plays a crucial role in his academic performance."—E. J. Kronenberger.

7758. Kauffman, James M., Weaver, S. Joseph, & Weaver, Ann. (U. Virginia) **Age and Intelligence as correlates of perceived family relationships of underachievers.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 522. Administered the Lorge-Thorndike Intelligence Tests and the Family Relations Test (FRT) to 46 8-16 yr. old remedial readers. Pearsonian correlations between CA and total number of FRT responses assigned to family members were negative but non-significant. FRT responses indicating positive and negative feelings may be assigned by S to a member of his family or discarded into an imaginary "Mr. Nobody" figure. Number of FRT responses discarded into "Nobody" was positively correlated with CA ($p < .05$). IQ was positively correlated with number of positive FRT responses assigned to family members ($p < .01$). Results are interpreted as consonant with previous research in child development.—Author abstract.

Frostig training with Headstart children. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 521-522.—Evaluated 2 groups of 15 Headstart children each in a northwestern state for test-retest changes on the Frostig Developmental Test of Visual Perception (FDTVP) and the Peabody Picture Vocabulary Test following training of the 1 group using Frostig-Horne materials. Significant between-group differences were observed only on FDTVP Area IV (position in space).—*Journal abstract*.

7766. Boshier, Roger. (U. Auckland, New Zealand) Motivational orientations of adult education participants: A factor analytic exploration of Houle's typology. *Adult Education*, 1971(Win), Vol. 21(2), 3-26.—Conducted a study (a) to test C. O. Houle's typology of "motivational orientation" in a New Zealand context, and (b) to develop a factor analytically based measure of motive for attendance. 233 adult education participants, selected at random from 3 institutions, completed the 48-item Education Participation Scale (EPS). A factor analysis and promax/varimax rotation yielded 14 1st-order factors which were subsequently intercorrelated, factor analyzed, and rotated to yield 2nd- and 3rd-order factors. In developing a model of adult education participation, it is proposed that participants are basically "being" or "deficiency" motivated. The concept of homeo- and heterostasis is discussed, and EPS factors purporting to measure these types of motivation are identified. Participation is shown to stem from motives more complex than those originally identified by Houle. (37 ref.)—*Journal abstract*.

7767. Brochu, Edith W. (U. Northern Colorado) A study of selected communication abilities of boys in all-male and traditional kindergarten and first grade classes. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4031.

7770. Cawley, John F., Burrow, Will H., & Goodstein, Henry A. (U. Connecticut) Performance of Head Start and non-Head Start participants at first grade. *Journal of Negro Education*, 1970(Spr), Vol. 39(2), 124-131.—58 1st graders (primary Head Start sample) who had previously participated in a research project were compared with 77 secondary Head Start sample Ss and 78 non-Head-Start Ss on the Stanford Binet, L-M, the Illinois Test of Psycholinguistic Abilities, and scales of the Detroit Tests of Learning Aptitude. Data from the Peabody Picture Vocabulary Test comparing the 3

groups during kindergarten revealed no significant differences using t tests. Using profile comparisons, it is concluded that differences between Head Start and non-Head-Start children are infrequent and "probably attributable to chance." It is further stated that "it is difficult to attribute the lack of differences to any particular factor or series of factors, inasmuch as experimental and control groups were not intact from the beginning of preschool."—W. E. Sedlacek.

7771. Conroe, Ray M. (State U. New York, Buffalo) The effect of varying the number and nature of facilitative interpersonal conditions introduced during a didactic-experiential training program on trainee level of functioning. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5618.

7772. Cowen, Emory. (U. Rochester) Community: Mothers in the classroom. *Psychology Today*, 1969(Dec), Vol. 3(7), 36-39. Nonprofessional teacher aides, mothers in the community, were assigned the duty of giving individual attention to 1st, 2nd, and 3rd graders. Several cases are presented to illustrate how the teacher aides were able to devote individual attention to children who were showing signs of poor adjustment. After personal contact the children began to achieve and/or were much less of a distraction for the other children. The aides could see more children than the professional staff and often the teachers felt more comfortable with the aides.—E. J. Posavac.

7783. Kidd, Thomas R. (Central Connecticut State Coll.) An evaluation of a foundations of physical activity course. *Research Quarterly*, 1971(Mar), Vol. 42(1), 35-41.—Determined the effectiveness of a physical activity course in the areas of (a) attitude toward physical activity, (b) voluntary physical activity behavior, (c) self-assessment ability on selected physical fitness performances, and (d) knowledge of the principles and benefits of physical activity. Pre- and postquestionnaires and tests were administered to 64 control and 64 experimental male college freshmen on attitude, physical activity behavior, and knowledge. Pre- and postquestionnaires and tests on self-assessment were administered to the experimental group. Results show that attitude toward physical activity of the experimental group dropped significantly and that although voluntary physical activity of both the experimental and control groups dropped significantly, there was no significant difference between the 2 groups. Ss were significantly better able to assess themselves on selected fitness performances and significantly improved in knowledge after participating in the course.—*Journal abstract*.

7818. Diaz-Guerrero, Rogelio. (National U., Mexico City, Mexico) **La enseñanza de la investigación en psicología en Iberoamérica: Un paradigma.** [The teaching of research in psychology in Latin America: A paradigm.] *Revista Latinoamericana de Psicología*, 1971, Vol. 3(1), 5-36.—The teaching of research in psychology in Latin America is not a simple technical problem. The lack of tradition of research, the absence of economic backing, the flooding of ready-made conceptions and operationally defined tools from the industrialized countries pose unique questions. A paradigm is described which has thus far proved successful in teaching research attitudes and practices in Mexican students. The model is a large cross-cultural research program in which the students become aware of both techniques and the cultural differences that their local populations have vis-à-vis samples of another culture. Cross-cultural research is described as an excellent model, for it forces the realization of the large number of variables that intervene in human behavior. (66 ref.)—*English abstract.*

7821. Gordon, Lillian L. **A review of research of 1960-1967 to evaluate the consideration of the use of hypnosis as a psychological tool in a college level reading and study skills laboratory.** *Journal of the Reading Specialist*, 1968(Dec), Vol. 8(2), 58-65.—Reviewed the research and considered the use of hypnosis as a psychological tool in college level reading laboratories. In this type of laboratory, students may receive training in remedial and developmental reading, spelling, and skills for better study. Hypnosis is defined as a state of consciousness characterized by heightened responsiveness to a direct suggestion. The following 4 states of hypnosis are acceptable to most authorities: (a) mild hypnosis, (b) dream hypnosis, (c) somnambulism, and (d) hypnotic coma. Characteristics of an S who illustrates a high degree of susceptibility to hypnosis are summarized. In reviewing clinical studies where hypnosis is used in college laboratories to aid students, it has been found to be effective, e.g., a light trance where the student is awake and aware of what is going on could be used for concentration and motivation, while somnambulism, where the S loses all contact with his surroundings, could be used in counseling.—A. M. Farfaglia.

7822. Greene, Frederick L. (U. Northern Colorado) **A comparison of the effectiveness of two aural formats on the listening comprehension of fifth grade children.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3990-3991.

7826. Heitzman, Andrew J. (State University Coll. New York, Geneseo) **Effects of a token reinforcement system on the reading and arithmetic skills learnings of migrant primary school pupils.** *Journal of Educational Research*, 1970(Jul), Vol. 63(10), 455-458.—Assigned 32 Negro migrant and 28 Caucasian 5-11 yr. olds attending a 6-wk summer school program to (a) a token reinforcement system, or (b) a conventional classroom. Pre- and postexperiment scores on the reading and arithmetic sections of the Wide Range of Achievement Test (WRAT) were analyzed. The reinforced group performed significantly better than the control group ($p < .05$). Considerable variation between treatment groups on the number of tokens dispensed was noted. Analysis of test scores revealed that the groups receiving more reinforcement performed significantly

better. Further analysis of treatment and racial differences indicate "that some factor associated with race may be a source of significant variation in the effects of token reinforcement." Implications for use of token reinforcement in the classroom are discussed.—S. Knapp.

7827. Herr, James F. (U. Missouri) **Illustrated instruction sheets as a supplement to teaching manipulative operations in graphic arts via video taped closed circuit television.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3918.

7828. Hunt, David E. (Ontario Inst. for Studies in Education, Toronto, Canada) **Matching models in education: The coordination of teaching methods with student characteristics.** *Ontario Institute for Studies in Education Monograph*, 1971, No. 10, 87 p.—Describes models to coordinate student characteristics with educational environments, and discusses how teachers can be trained to provide such environments. The term matching is used to capture the nature of person-environment relations, e.g., a structured lecture may be well matched to students who are compulsive and authoritarian, but poorly matched for independent students. Matching is used as a description of the interactive effects of person and environment. The 5 chapters describe matching models both in the classroom and in teacher training. The aim of the study is to convey the concept of matching as a way of thinking about the complexities of person-environment interaction in education. (5 p. ref.)—A. M. Farfaglia.

7831. Layer, Harold A. (San Francisco State Coll., Audio Visual Center) **Ethnic studies and audiovisual media: A listing and discussion.** *ERIC-Stanford Calif., Occasional Paper*, 1969(Jun), 11 p.—Presents an extensive list of media for presentation to senior high school or college level audiences which deal with the history and present condition of nonwhite minorities in the United States. Materials are listed by subject matter: general ethnic, Asian-American, Negro, Mexican/Spanish-American, and native American studies. The medium, title, distributor, and availability of all materials are fully identified.—S. Knapp.

7832. Montor, Karel. (U.S. Naval Academy) **Affect of using a self-scoring answer sheet on knowledge retention.** *Journal of Educational Research*, 1970(Jul), Vol. 63(10), 435-437.—Tested the usefulness of the trainer-tester self-scoring answer sheet for increasing knowledge retention. 22 naval academy midshipmen served in an experimental group using the answer sheets. 20 other midshipmen took the same course under conventional teaching. Analysis of variance for quizzes indicates that no significant difference was attained between those receiving immediate feedback and those who did not. While not statistically conclusive, results suggest the possibility that immediate reinforcement may have 2 components: (a) whether the answer is right or wrong, and (b) why the answer is right or wrong. The importance of b is discussed for long-term retention.—*Journal abstract*.

7833. Nathan, Gerald D. (U. Nebraska) **A compar-**

ison of forward and backward chaining techniques for the teaching of meaningful verbal material. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3967.

7836. Olver, Joan K. & Taylor, Bob L. (Horace Mann Jr. High School, Denver, Colo.) **The effects of two methods of teaching social studies on immediate retention.** *Journal of Educational Research*, 1970(Jan), Vol. 63(5), 198-200. — Determined the differential effects on immediate retention of 2 methods of teaching social studies. 1 method incorporated immediate knowledge of the correct response while the other provided no knowledge of the correct response. Ss were 23 pairs of accelerated, 8th grade students and 19 pairs of slow, 8th grade students, matched for age, sex, level of ability, and score on a social studies achievement test. 2 series of treatments were used, and t tests were run to determine if there was a significant difference in the mean performance of the groups. Results indicate that (a) provision of knowledge of results in a method of teaching social studies material to 8th grade accelerated Ss had no significant effect on retention scores of the Ss; (b) provision of knowledge of results in a method of teaching social studies material to 8th grade, slow Ss had a positive and significant effect on the retention scores of the Ss; and (c) accelerated, 8th grade Ss scored significantly higher scores of retention than did slow Ss regardless of the method used. (21 ref.) *Journal abstract*

7846. Thorpe, JoAnne West, Charlotte, & Davies, Dorothy. (Southern Illinois U.) **Learning under a traditional and experimental schedule involving master classes.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 83-90. — Describes a study involving 32 classes of badminton (N = 732), 6 master teachers and 11 other teachers. 21 classes were scheduled under the master class plan in which students from 2 or 3 classes met in a combined group once wk and in their regular classes twice wk. 11 classes were scheduled under the traditional plan, in which classes met 3 times wk. Tests of knowledge and skill were administered prior to and after instruction. The sum of the 4 T scores was used as the overall skill measure. Estimates of reliability for the final tests ranged from .78-.91. Validity of the skill tests was established by using tournament rank as the criterion. Linear regression analyses indicate that classes were not equal in skill or in knowledge at the beginning of the study. Full models utilized in the regression analyses of the posttest, therefore, included the pretests as predictors. The traditional method of scheduling was superior to the master class method and within the master classes, the more experienced master teachers obtained better results than the less experienced. T tests for correlated samples including all of the Ss indicate that significant learning occurred between the pre and posttests for classes under both methods. — *Journal abstract*

On the basis of correlational and factor analytic studies, 4 fundamental categories are suggested for performance appraisal: (a) activity, the volitional aspects of behavior; (b) thinking, the utilization of technical competence; (c) human effectiveness, effectiveness in interpersonal relations; and (d) reliability, behavior in relation to the given norms of a structured task. It is suggested that these 4 categories cover the appraisal needs for lower and medium level jobs. Although an extension of the system may be necessary to cover higher level jobs, it is suggested that this not be accomplished at the expense of the basic model. Defined scales for each of the suggested categories are presented, and the problem of weighting is discussed. The development of objective criteria regarding careers, their evaluation, remunerative needs, and security is suggested.—English abstract.

7876. Sullivan, Howard J., Schutz, Richard E., & Baker, Robert L. (Southwest Regional Lab. for Educational Research & Development, Inglewood, Calif.) **Effects of systematic variations in reinforcement contingencies on learner performance.** *American Educational Research Journal*, 1971(Jan), Vol. 8(1), 135-142.—72 ROTC Cadets participated in an investigation of the effects on learner performance of variations in (a) reinforcement contingencies for performance, and (b) knowledge of results for responses to mastery items inserted in instructional material. Ss receiving immediate feedback indicating the correct response for each en route mastery item scored significantly higher on the 100-item final test ($p < .05$) than Ss receiving delayed feedback for mastery-item responses. Each S could earn release from a maximum of 3 drill periods for acceptable test performance. Ss under the drill period contingency scored significantly higher than a comparable group had scored under a monetary contingency with a \$4 maximum. The findings suggest that improvements in instructional materials may not result in a corresponding increase in learner achievement unless an effective reinforcer is available for acceptable achievement.—*Journal abstract.*

TASK & WORK ANALYSIS

7877. Bálint, István; Murányi, Mihály, & Avar, Pál. (Industrial Hygiene Inst., Budapest, Hungary) **A pszichofiziológiai megterhelés és az alkalmazkodás vizsgálata kartográfiai dolgozóknál.** [Examination of psychological stress and adjustment in personnel engaged in cartographical work.] *Pszichológiai Tanulmányok*, 1968, No. 11, 377-392.—The performance of photogrammetrical measurements involves specific stress for the nervous system. Complex examinations of 37 workers engaged in this type of work have been made. They included psychological assessment of environmental and other work conditions, and the analysis of the psychophysiological factors in the work process. An attempt was made to reveal and grade stress factors occurring in the course of work. The 2nd part of the study which included psychological and psychiatric exploration as well as the neurological screening of the Ss, was carried out to analyze the effect of stress factors. According to data, stress factors have not caused any symptoms or serious complaints. Nevertheless, it seems advisable to introduce some improvements (ventilation, illumination) and to eliminate or lessen the stress effect of work done in alternating shifts. Moreover, it would be advisable to shorten working hr. Repeating examinations of this kind from time to time is considered to be highly desirable so that a trend in the relation of stress factors and adjustment could be studied over a considerable period of time. Gibson, Dennis L., Weiss, David J., Dawis, Rene V., & Lofquist, Lloyd H. **Manual for the Minnesota Satisfactoriness Scales.** *Minnesota Studies in Vocational Rehabilitation*, 1970(Dec), No. 27, 51 p.—Describes the development of the Minnesota Satisfactoriness Scales (MSS) from supervisor ratings of 2373 workers. The MSS is scored on 5 scales: (a) Performance, (b) Conformance, (c) Dependability, (d) Personal Adjustment, and (e) an overall score for General Satisfactoriness. The text of the MSS and norms for 5 occupational groups (professional, managerial, and technical; clerical and sales; service; machine trades and bench work; and workers-in-general) are presented. Technical data on the reliability and validity of the MSS are included. (18 ref.)—*Journal summary.*

7883. Ivancevich, John M. & Donnelly, James H. (U. Kentucky) **Leader influence and performance.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 539-549.—Investigated the impact of incremental influence of the leader upon performance. French and Raven's classic topology of power was used. Incremental power was operationally defined as the combined referent and expert power of a leader. The 5 dimensions of power (reward, coercive, legitimate, referent, and expert) are measured on a rating scale. The 8 measures of performance were obtained from organizational records. 2 types of performance data were collected: (a) nonparticipating performance—excused absenteeism, unexcused absenteeism, and turnover; and (b) participating performance—market potential ratio, number and size of orders, efficiency rating, direct selling costs, and route density factors. Data were collected on 394 salesmen from 31 different sales branches of a company. The results generally support the 2 hypotheses: (a) incremental influence is related positively to participative performance measures, and (b) incremental influence is negatively correlated with nonparticipative measures of performance. 7892. **Bolar, Malathi.** (1st National City Bank,

Bombay, India) **Measuring effectiveness of personnel policy implementation.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 463-480.—A questionnaire was developed to measure the effectiveness of personnel policy implementation within an organization. The questionnaire measured the 3 organizational aspects of perceived policy, agreement with the policy, and effectiveness of the policy, over 7 personnel policy dimensions. 4 companies were used to test the questionnaire (2 pharmaceutical and 2 engineering). Results indicate that the questionnaire provided a reliable and meaningful method to measure the effectiveness of personnel policy. In addition to yielding a comparative assessment of policy areas relative to effectiveness it also yielded a measure of internal effectiveness as compared to the objectives of top management. (19 ref.)—*D. L. Dieterly.*

7893. **Bons, Paul M., Bass, Alan R., & Komorita, S. S.** (U.S. Military Academy, West Point, N.Y.) **Changes in leadership style as a function of military experience and type of command.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 551-568. Examined the changes in leadership style over different levels of experience for the members of the 1965 graduating class of West Point. 7 dimensions of leadership were measured. The 596 cadets were required to describe, on a 20-dimension, 6-point scale themselves, their most preferred co-worker, their least preferred co-worker, and an ideal military officer. These descriptions yielded the 5 measures of assumed similarity between opposites, least preferred co-worker, most preferred co-worker, self-ideal, and self-esteem. In addition to these measures the dimensions of initiating structure and consideration were obtained from a modified version of the Fleishman Leadership Opinion Questionnaire. 4 levels of task pressure were conceptualized to account for the different types of leadership command experience each officer encountered on his initial assignment in the military. The posttest measures of the 7 leadership dimensions were obtained through mailed questionnaires sent to the officers about 18 mo. after the 1st testing. Results indicate that leadership style measures change over command experience and that different levels of command experience produce different types of changes. (23 ref.)—*D. L. Dieterly.*

7894. **England, George W. & Keaveny, Timothy J.** (U. Minnesota) **The relationship of managerial values and administrative behaviour.** *Manpower & Applied Psychology*, 1969(Win), Vol. 3(1/2), 63-75.—Studied the relationship between personal value systems and behavior in 72 managers varying widely on organizational and personal variables. Ss completed the Personal Value Questionnaire which required them to rate the importance of goals and ideas and the extent to which its meaning was viewed as successful, right, or pleasant. 34 moralists, 30 pragmatists, and 6 mixed-orientation Ss were distinguished. None were classed as affective. An in-basket task was used as a behavioral measure of decision making, action, and control and communication patterns. It was found that pragmatists were more concerned about factors reflecting (a) organizational success—industry leadership, profit maximization, and organizational efficiency, (b) control or possession of power; and (c) getting ahead. Moralists were more concerned about fellow employees and traditional or sociocultural factors. It is concluded that "identification of primary orientation contributes in a significant way to correlating managerial values and administrative be-

haviour." Some support is also given to the position that differences in concepts viewed as highly important and fitting one's primary orientation are related to differences in behavior.—S. Knapp.

7895. Fordyce, Jack K. & Raymond Weil. **Managing with people: A manager's handbook of organization development methods.** Reading, Mass.: Addison-Wesley, 1971. x, 192 p.

7896. Ghiselli, Edwin E. & Johnson, Douglas A. (U. California, Berkeley). **Need satisfaction, managerial success, and organizational structure.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 569-576.—Utilized a questionnaire to measure need satisfaction based upon Maslow's 5 need dimensions: security, social, esteem, autonomy, and self-actualization. Ss were 413 managers in a wide variety of different business and industrial establishments. The firms were categorized into those that were flat (few levels of management), or tall (many levels of management). A criterion measure of success was obtained by referencing the organizational level the individual attained to the average level reached by managers of the same age. Correlations were computed between the degree of satisfaction and achieved success. Results indicate that for managers in tall organizations there was little relationship between the degree of need satisfaction and success, while in flat organizations a positive relationship existed for the higher order needs.—D. L. Dieterly.

7897. Klein, Stuart M. & Maher, John R. (U. Kentucky). **Decision-making autonomy and perceived conflict among first-level management.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 481-492.—Tested 2 hypotheses: (a) decision-making autonomy is directly related to perceptions of conflict, and (b) the relationship is modified by the degree of congruence between the individual's perceptions of his own autonomy and the amount of autonomy he feels he should legitimately have. 400 Ss, selected at random, were drawn from the 1st-level management population of 12 manufacturing plants of a large industrial corporation. They were administered a 429-item questionnaire. 23 of these items were selected to provide a measure of perceived decision-making autonomy, perceived legitimacy of autonomy, and perception of conflict. The data on these 3 measures were submitted to an analysis of variance and the results supported Hypothesis a but not b. It is concluded that "the relationship between lack of decision-making autonomy and conflict strongly underscore the importance of autonomy to a manager carrying out his assigned duties." (26 ref.)—D. L. Dieterly.

7898. McDonald, Blair W. (U. Utah). **Factored dimensions of organizational climate.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5048.

7899. Miles, Raymond E. & Ritchie, J. B. (U. California, Berkeley). **Leadership attitudes among union officials.** *Industrial Relations*, 1968(Oct), Vol. 8(1), 108-117.—Studied the leadership attitudes of over 100 union officers holding positions at various levels in the union hierarchy. Their theories of how and by whom decisions ought to be made in their organizations are examined. Questionnaires were returned by 110 union officials. The study suggests that union leaders tend to advocate lower level participation in decision making and setting bargaining goals. They do not feel that this participation will result in improved decisions or reasonable bargaining goals. The value of increased lower level participation is viewed in terms of improved morale

and greater acceptance of decisions made by supervisors.—A. M. Farfaglia.

7900. Milkovich, George T. (U. Minnesota). **Toward a system of systems.** *Manpower & Applied Psychology*, 1969(Win), Vol. 30(2), 37-41.—Distinguishes similarities and differences of structural, process, and decision systems. Each system's approach is discussed for (a) purposes, (b) elements, (c) relationships and causality, (d) dynamic-static considerations, (e) operationalization, and (f) validation. It is concluded that none of the approaches considered is universally applicable, and that "each approach represents a way of looking at phenomena under study." (21 ref.)—S. Knapp.

7904. Schneider, Benjamin & Bartlett, C. J. (Yale U.). **Individual differences and organizational climate: II. Measurement of organizational climate by the multi-trait, multi-rater matrix.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 493-512.—Presents, in this follow-up article to the study by B. Schneider and C. J. Bartlett (see PA, Vol. 43:4580), the initial results of an organizational climate test (Agency Climate Questionnaire, ACQ) developed to be used with insurance agencies. The ACQ consists of 80 items, which were factor analyzed into 6 dimensions: managerial support, intraagency conflict, managerial structure, new employee concern, agent independence, and general satisfaction. The ACQ was administered to 125 managers and 386 agents representing 69 life insurance agencies. The data are analyzed to show the intralevel reliability, agent-agent reliability, manager-manager reliability, and interlevel relationships. The question is raised as to which view of the organizational climate should be considered absolute—manager, assistant manager, or agent—since there was a lack of congruence between their assessments. Results indicate that the ACQ developed is a reliable measure which may yield an approach to establishing viable criteria for selecting potential agents. (28 ref.)—D. L. Dieterly.

7905. Šebek, Levin & Peršić, Bogomir. (Faculty of Philosophy, Ljubljana, Yugoslavia). **Učjecaj majstora na produktivnost rada u maloj grupi.** [The foreman's influence on the productivity of the small work group.] *Revija za Psihologiju*, 1970, Vol. 1(1), 49-53.—In addition to daily productivity indices, daily ratings of the foreman's behavior by the employees were used as an indicator of the work group morale. 6 groups, each of 10-12 female workers, in 1 textile factory were Ss in this 3-mo study. A small positive correlation was obtained between daily ratings of the foreman's behavior and the daily productivity of the group. Such a small correlation was explained by the influence of a number of confounding factors which independently influenced the productivity and ratings. The length of job experience of

the foreman was singled out as probably the most important factor contributing to his popularity in the work group.—*English summary.*

7906. Singh, Gurdial. (Shree Ram Centre for Industrial Relations, New Delhi, India) **Styles of supervision and organisational effectiveness: An integrated view.** *Psychology Annual*, 1969(Mar), Vol. 3, 14-16.—Discusses the controversy over the effectiveness of various supervisory styles. Close (authoritarian) and general (democratic) supervisory styles and their theoretical backgrounds in traditional management and human relations schools are described. Contradictory evidence from studies on the productivity associated with both systems are noted. The nature of technology is considered. It is concluded that the productivity of a particular style of supervision is dependent on the tasks, the people, and the organizational design.—*S. Knapp.*

7907. Skrocki, Ralph C. (Western Michigan U.) **Perceived behavioral changes in first-line supervisors who participated in a basic management program.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3923-3924.

7912. Wood, Michael T. & Sobel, Robert S. (Ohio State U.) **Effects of similarity of leadership style at**

two levels of management on the job satisfaction of the first level manager. *Personnel Psychology*, 1970(Win), Vol. 23(4), 577-590.—Compared the effects of leadership style, as measured by the esteem for the least preferred co-worker, developed by Fiedler, to satisfaction as measured by the Job Description Index. Data were collected on managerial personnel in 21 United States Post Offices. The study was designed to test the hypothesis that the 1st-line managers working under 2nd-line managers whose leadership styles are similar are more satisfied than 1st-line managers whose superiors have a dissimilar leadership style. The results, based on a series of paired t tests, generally supported the hypothesis. (16 ref.)—*D. L. Dieterly.*

7913. Wyman, Forrest P. (U. Colorado) **A model for assigning personnel to work groups to facilitate group cohesiveness.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5689-5690.

SPECIAL ENVIRONMENTS

7914. Doll, Richard E. & Gunderson, E. Eric. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Group size, occupational status and psychological symptomatology in an extreme environment.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 196-198.—Data were obtained on 152 Navy enlisted men and 94 civilian scientists and technicians assigned to United States Antarctic stations for 1 yr. during 1964-1968. The only finding which suggested a relationship between group size and psychological symptomatology was that of hostility within the military contingent in early winter. There was a higher level of hostile feelings at the smaller stations. Differences in depression related more to military-civilian status than to group size. The military expressed more depression throughout the winter and more insomnia in late winter than the civilians.—*E. J. Kronenberger.*

7915. Luria, S. M. & Kinney, Jo Ann. (U.S. Naval Submarine Medical Center, New London, Conn.) **Underwater vision.** *Science*, 1970(Mar), Vol. 167(3924), 1454-1461.—Discusses the physical and psychological bases of visual distortions that occur underwater. Images of an underwater object are altered in apparent size and distance; color and brightness are changed, and outlines become less distinct. Factors contributing to such distortions are reviewed, including the type and source of water. Differences in resolution acuity and stereoscopic acuity for air and water are compared. Adaptation to visual distortion is reviewed, emphasizing factors which facilitate the adaptation process. The underwater environment permits studies of adaptation under natural rather than artificial conditions. (36 ref.)—*P. McMillan.*

7916. Narasaki, Shiro; Fukuda, Junichi; Kozaki, Masataka, & Takimoto, Nobuko. (Jikei U., Medical School, Tokyo, Japan) [On the fatigue of the civil air transportation crews observed from their visual functions: II. On the influence of the days of training flight to the visual functions of crews.] *Japanese Journal of Aerospace Medicine and Psychology*, 1969(Jun), Vol. 6(2), 35-41.—Assessed visual functioning tests of night vision, accommodative near point, depth, kinetic vision, vertical phoria, and horizontal phoria in 5 25-39 yr. old male flight engineers prior to and on the 1st, 2nd, and 3rd days of continuous training flights. Results demonstrate that prolonged accommodative near point was the 1st sign of fatigue. Vertical phoria and diminished visual acuity

accompanied by decreased kinetic vision occurred in response to fatigue. Night vision, however, was not significantly affected.—*English abstract.*

DRIVING & SAFETY

7921. Bracy, Lewis F. (U. Southern Mississippi) **An exploration of the relationship between personality factors and automobile accident proneness.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4967.

7922. Haward, L. R. **Personality of parachutists: I.**

Neuroticism, extraversion and stress tolerance. *Flight Safety*, 1969(May), Vol. 2(4), 12-15.—Tested the hypothesis that the higher casualty rate with lower risk level encountered in civilian parachuting exists because civilian parachutists as a group include a higher proportion of individuals prone to impaired behavioral efficiency during the critical phase of descent, and that it is these individuals who contribute to the higher casualty rate. A questionnaire was circulated to active participants in the sport, and 180 were received back. The questionnaire consisted of questions plus a standard personality questionnaire. The 2nd stage of the investigation consisted of individual tests of volunteer parachutists using special psychological tests together with physiological measures of stress resistance. It is already clear that the higher stress response of civilian parachutists ($N = 19$) represents a slightly greater risk than that borne by military paratroops in that stress-paralysis becomes more probable.—*S. R. Diamond.*

7923. Sreekumar Menon, A. (Sree Ram Center for Industrial Relations, New Delhi, India) **A study of psycho-physiological and sensori-motor factors involved in accidents and accident proneness in industry.** *Psychology Annual*, 1969(Mar), Vol. 3, 31-33.—Compared accident free, accident repeating, high accident, and low accident groups of workers on 29 components of sensorimotor ability and measures of psychophysiological functioning. Differentiating factors significant at or beyond the .05 level, found for accident free and accident repeating Ss and for high and low accident Ss, included (a) visual acuity, (b) visual discrimination, (c) depth perception, (d) muscular strength, (e) arm steadiness, (f) speed and accuracy of 2 hand coordination, and (g) tweezer dexterity in filling. It is concluded that this approach to investigations of accidents is promising, and that such prognosticating devices may be of use in employment and training programs.—*S. Knapp.*

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents, and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

Ability (see also Childhood/Ability in)

College Counseling (SEE Counseling, Guidance/Educational, Guidance/Vocational)
College Student (SEE Student/College)
College Success (SEE Achievement, Academic-College)
Color (see also Color Vision)
 5988, 6099, 6331, 6379, 6482, 6492, 6909, 7322, 7593, 7847
Color Vision
 6022, 6247, 6258, 6261, 7113, 7915
Communication (see also Communication, Nonverbal, Information, Language, Speech, Verbal Behavior)
 5957, 5958, 6158, 6463, 6616, 6682, 6715, 6731, 6732, 6738, 6771, 6776, 6778, 6781, 6782, 6783, 6793, 6807, 6809, 6815, 6914, 6935, 6944, 6973, 7063, 7239, 7245, 7250, 7251, 7633, 7767, 7774, 7785, 7823, 7842, 7910, 7918
Communication/Animal (SEE Communication, Vocalization)
Communication/Mass (see also Television, Advertising)
 6682, 6807, 6808, 7636, 7816, 7848
Communication/Nonverbal
 6588, 6738, 6779, 6793, 6801, 6807, 6959
Community (see also Culture, Group)
 6643, 7047, 7121, 7237, 7241, 7595, 7614, 7782
Community Services (see also Clinic, Mental Health)
 6617, 6948, 6980, 7048, 7240, 7241, 7376, 7377, 7378, 7379, 7380, 7384, 7798, 7816
Comparative Psychology (see also Animal Psychology)
 6371, 6372, 7001
Competition (see also Conflict, Cooperation, Motivation)
 6354, 6584, 6750, 6851, 7685, 7800
Complexity (see also Cognitive Style, Stimulus)
 6069, 6070, 6512, 6620, 7329, 7385, 7879
Comprehension (see also Thinking, Reading)
 6132, 6157, 7474, 7484, 7738, 7822
Compulsion (SEE Obsession-Compulsion)
Computer
 5976, 5977, 5978, 5979, 5980, 5981, 5982, 6055, 6921, 6958, 7395, 7396, 7572, 7810, 7812, 7817, 7819
Concentration Camp (SEE Prison, War)
Concept (see also Childhood/Concepts & Problem Solving in, Concept Formation, Thinking)
 6138, 6167, 6168, 6169, 6170, 6171, 6172, 6627, 6645, 6749, 6876, 6877, 7494, 7594
Concept Formation (see also Childhood/Concepts & Problem Solving in)
 6166, 6883
Conditioned Emotional Response
 6370, 6410, 6501
Conditioned Galvanic Skin Response (SEE Galvanic Skin Response)
Conditioned Reflex (SEE Conditioned Response, Reflex)
Conditioned Response
 6103, 6108, 6190, 6204, 6224, 6337, 6389, 6437, 6450, 6470, 6491
Conditioning (see also next headings)
 6216, 6266, 6486, 6501, 7003, 7205, 7697
Conditioning/Avoidance (SEE Learning Avoidance, Rat/Avoidance & Avoidance Learning in)
Conditioning/Classical
 6103, 6105, 6106, 6107, 6108, 6370, 6412, 6428, 6461, 7126, 7852, 7920
Conditioning/Escape (SEE Escape)
Conditioning/Eyefield
 6106, 7126
Conditioning/Interceptive
 6103, 6104, 6105, 6342, 6343, 7129
Conditioning/Operant (see also Rat/Conditioning in)
 6102, 6110, 6111, 6401, 6405, 6409, 6429, 6436, 6439, 6440, 6443, 7000, 7407, 7530, 7722, 7809
Conditioning/Verbal (SEE Learning/Verbal)
Conference (SEE Symposium)
Confidence Judgment (SEE Certainty)
Conflict (see also Frustration, Learning Avoidance, Interpersonal Processes)
 6067, 6094, 6301, 6561, 6750, 6759, 6840, 6864, 7005, 7195, 7897
Conformity (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
 5978, 6582, 6615, 6668, 6774, 6797, 6806, 7665
Congress (SEE Symposium)
Connotation (SEE Meaning, Semantics)
Conscience (SEE Value & Values, Ethics, Motivation)
Conscious States (see also Awareness)
 6325
Conservation (SEE Childhood/Concepts & Problem Solving in)
Conservatism (SEE Political Behavior, Personality Trait)
Consonance (SEE Dissonance)
Constancy (SEE Gestalt Psychology, Visual Perception, Perception)
Consumer Behavior (see also Advertising)
 7917, 7918, 7919, 7920
Contagion (SEE Interpersonal Influence, Social Influence)
Content (SEE Information, Meaning)
Context
 6019, 6157, 6494, 7689
Contraception (SEE Birth Control)
Contribution & Criticism
 5969, 5973, 5974, 6081, 6087, 6551, 6563, 6673, 6691, 6692, 6733, 6786, 6801, 6803, 6878, 6896, 7131, 7217, 7267, 7682, 7692, 7869, 7873
Control (see also Display)
 6410
Control/Internal-External
 6096, 6169, 6553, 6554, 6621, 6702, 6767, 6859, 6869, 6870, 6872, 6889, 6988, 7054, 7096, 7134, 7429, 7471, 7515, 7518, 7550, 7672, 7707, 7720, 7726, 7730, 7799, 7920
Convulsion (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
Cooperation
 6763, 6767, 6780, 6786
Coordination (SEE Motor Performance)
Coping Behavior (SEE Adjustment/Personal & Social)
Copulatory Behavior (SEE Sexual Behavior-Animal)
Correlation (see also Factor Analysis, Statistics)
 5971, 6113
Cortex (SEE Cerebral Cortex, Visual Cortex)
Counseling (see also Guidance/Educational, Guidance/Vocational, Interview)
 5955, 6950, 6967, 7089, 7094, 7144, 7152, 7244, 7245, 7246, 7247, 7248, 7249, 7251, 7510, 7522, 7536, 7537, 7538, 7539, 7540, 7541, 7542, 7546, 7547, 7548, 7551, 7551, 7554, 7557, 7559, 7560, 7561, 7563, 7564, 7566, 7569, 7570, 7571, 7572, 7574, 7576, 7578, 7580, 7581, 7582, 7583, 7586, 7587, 7588, 7590, 7591, 7594, 7596, 7598, 7653, 7855, 7858
Counseling/College (SEE Guidance/Educational, Guidance/Vocational)
Counselor
 6827, 6936, 6949, 7239, 7245, 7247, 7249, 7251, 7540, 7546, 7551, 7555, 7558, 7559, 7566, 7582, 7585, 7592, 7595, 7597, 7600
Countertransference (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis Therapeutic Process)
Counting (SEE Mathematics, Number)
Court (SEE Law, Crime & Criminals)
Courtship (SEE Interpersonal Attraction)
Creativity (see also Aesthetics, Gifted, Literature, Music, Thinking)
 6162, 6553, 6566, 6725, 6883, 6884, 6911, 6915, 7442, 7464, 7502, 7511, 7606, 7623, 7688, 7728, 7733, 7776, 7884
Credibility (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)
Crime & Criminals (see also Delinquency Juvenile, Law, Prison)
 6894, 6912, 6926, 7025, 7066, 7085, 7111, 7123, 7124, 7125, 7126, 7127, 7128, 7130, 7131, 7132, 7133, 7134, 7135, 7137, 7168, 7369, 7431
Crisis & Crisis Intervention (see also Community Services, Emotion)
 6617, 6659, 6941, 7118, 7121, 7178, 7648
Critical Flicker Fusion (SEE Vision)
Criticism (SEE Contribution & Criticism)
Cross-Cultural Differences (see also Culture, Cultures & Countries)
 6629, 6669, 6670, 6671, 6672, 7156, 7668, 7818, 7859
Cue
 6020, 6021, 6037, 6079, 6099, 6116, 6120, 6134, 6140, 6149, 6153, 6346, 6399, 6404, 6563, 6588, 6589, 6596, 7342, 7388, 7690
Cultural Anthropology (SEE Culture)
Cultural Disadvantage (SEE Socioeconomic Status, Childhood/Disadvantages)
Culture (see also Cultures & Countries, Ethnology, Social Influence)
 6479, 6533, 6552, 6644, 6646, 6648, 6651, 6657, 6664, 6681, 6707, 6708, 6710, 7065, 7107, 7321, 7355, 7451, 7604, 7612, 7851
Cultures & Countries (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR)
 6533, 6543, 6657, 6672, 6712, 6768, 7174, 7286, 7466, 7668, 7801, 7859
Curiosity (SEE Motivation, Thinking)
Curriculum (see also School Administration)
Mathematics, Reading
 5956, 6548, 6642, 6709, 7410, 7418, 7423, 7426, 7440, 7444, 7449, 7459, 7471, 7482, 7496, 7517, 7569, 7579, 7589, 7632, 7644, 7655, 7656, 7660, 7665, 7668, 7676, 7678, 7684, 7691, 7695, 7698, 7699, 7703, 7708, 7709, 7713, 7715, 7724, 7728, 7731, 7732, 7735, 7740, 7750, 7762, 7764, 7768, 7771, 7773, 7778, 7779, 7780, 7781, 7783, 7788, 7789, 7790, 7792, 7794, 7795, 7796, 7801, 7804, 7807, 7810, 7817, 7825, 7829, 7836, 7838, 7840, 7843, 7844, 7846, 7849, 7850, 7853
Contaneous Sense (see also Skin)
 5992, 5993, 5995, 6040, 6399, 6519, 6551, 7203
Cybernetics (SEE Communication, Feedback Computer)
Dark Adaptation (SEE Adaptation/Sensory)
Data Processing (SEE Computer, Statistics)
Day Dreaming (SEE Fantasy)
Deafness & Hearing Disorder

BRIEF SUBJECT INDEX

- 6917, 7263, 7264, 7265, 7266, 7267, 7268, 7269, 7280, 7363, 7476, 7477, 7478, 7481, 7484, 7485, 7633
- Death** (see also Suicide)
6623, 6752, 6941
- Death Penalty** (SEE Law)
- Deception**
6559, 6779, 7639
- Decision Making** (see also Choice Behavior, Game, Learning/Probability)
6151, 6173, 6174, 6175, 6483, 6672, 6682, 6745, 7397, 7862, 7897, 7899
- Decoding** (SEE Categorical Behavior, Problem Solving, Display)
- Defecation** (SEE Elimination)
- Defense Mechanism** (see also Identification, Repression)
6071, 6803, 6842, 6848, 6849, 6859, 6865, 6866, 6868, 6997, 7111, 7179, 7202
- Defense/Perceptual** (SEE Defense Mechanism)
- Defensiveness** (SEE Defense Mechanism, Personality Trait)
- Deja Vu** (SEE Familiarity, Parapsychology)
- Delayed Reaction** (SEE Response)
- Delinquency/Juvenile** (see also Antisocial Behavior, Crime & Criminals)
7057, 7085, 7133, 7136, 7137, 7138, 7139, 7140, 7141, 7142, 7143, 7144, 7145, 7146, 7147, 7148
- Delirium** (SEE Mental Disorder, Neurosis, Psychosis)
- Delusion** (SEE Mental Disorder, Neurosis, Psychosis)
- Demographic Variables** (SEE Population Characteristics)
- Denial** (SEE Defense Mechanism)
- Dependency**
6465, 6584, 6601, 6609, 6682, 6842, 6847, 6874, 6888, 7095, 7164, 7178, 7179, 7181, 7373, 7422, 7423, 7530, 7651, 7881, 7897
- Depression** (see also Emotion, Emotional Disturbance)
6361, 6840, 6847, 6916, 7009, 7020, 7023, 7024, 7027, 7034, 7037, 7043, 7044, 7045, 7084, 7127, 7152, 7162, 7170, 7175, 7177, 7189, 7225
- Deprivation** (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat/Deprivation in)
6391, 7108, 7451
- Deprivation/Sensory**
6002, 6459, 7187
- Depth Perception** (SEE Perception/Depth)
- Desegregation** (SEE Integration)
- Densitization Therapy** (SEE Behavior Therapy)
- Detection**
6027, 6033, 6035, 6036, 6037, 6038, 6083, 6106, 6570, 6791
- Developing Countries** (SEE Cultures & Countries)
- Development** (see also Childhood/Development in, Language Development, Maturation)
6086, 6466, 6607, 6613, 7243, 7394
- Dexterity** (SEE Hand, Motor Performance)
- Diabetes** (SEE Blood, Disease)
- Diagnosis** (see also Psychodiagnosis, Schizophrenia/Diagnosis of, Mental Retardation/Diagnosis of)
6902, 6922, 6931, 7061, 7299, 7302, 7304, 7305, 7306, 7309
- Diagnosis/Differential**
7072, 7073, 7527
- Dial** (SEE Display)
- Diet** (SEE Food)
- Differential Reinforcement at Low Rates of Responding** (SEE Reinforcement Schedule)
- Digestive System** (see also Metabolism)
6205, 6269, 6320, 6364, 6469
- Digit** (SEE Number)
- Disability** (SEE Physical Handicap)
- Disarmament** (SEE War, International Relations)
- Discrimination** (see also Auditory Discrimination, Learning/Discrimination, Visual Discrimination, Rat/Discrimination in)
5993, 6138, 6450, 6470, 6820, 7520
- Discrimination Learning** (SEE Learning/Discrimination)
- Discrimination Reversal**
6414
- Discrimination/Racial** (SEE Integration, Prejudice, Social Movements)
- Disease** (see also Illness)
7099, 7232, 7233, 7281, 7333, 7359, 7364, 7367, 7369, 7372
- Displacement** (SEE Defense Mechanism)
- Display** (see also Control)
- Dissonance** (see also Attitude Change)
6698, 6709, 6717, 6789, 7881
- Distance** (SEE Perception/Depth)
- Distraction** (SEE Attention)
- Diurnal Rhythms** (SEE Biological Rhythms)
- Divorce** (SEE Marital Problems)
- DNA** (SEE Biochemistry)
- Dog**
6190, 6206, 6224, 6297, 6386, 6397
- Dogmatism** (SEE Authoritarianism, Personality Trait)
- Dominance** (see also Authoritarianism)
5984, 6561, 6595, 6728, 6735, 6759, 7609
- Double Blind Design** (SEE Experimental Design)
- Down's Syndrome** (SEE Genetics, Mental Retardation)
- Draft** (SEE Military)
- Draw-A-Man Test** (SEE Projective Technique)
- Draw-A-Person Test** (SEE Projective Technique)
- Drawing** (see also Aesthetics, Creativity, Picture)
6040, 6565, 6566, 7013, 7149, 7590
- Dream & Dreaming** (see also Rapid Eye Movement, Sleep)
6043, 6044, 6046, 6363, 7032, 7064
- Drinking** (SEE Alcohol, Water & Water Intake)
- Drive** (SEE Motivation)
- Driving** (see also Safety)
6021, 7849, 7921
- DRL** (SEE Reinforcement Schedule)
- Dropout** (SEE School Dropout)
- Drug Addiction** (see also Drug Effects, Drugs)
6962, 6963, 7030, 7033, 7086, 7088, 7089
- Drug Effects** (SEE next headings, Drug Addiction)
- Drug Effects-Human** (see also Rat/Drug Effects in, Cat/Drug Effects in, Drugs)
6186, 6206, 6211, 6265, 6266, 6267, 6269, 6272, 6288, 6290, 6292, 6295, 6296, 6297, 6298, 6299, 6302, 6305, 6306, 6307, 6312, 6315, 6318, 6320, 6324, 6329, 6331, 6333, 6334, 6337, 6338, 6339, 6357, 7026, 7031, 7033
- Drug Effects-Human** (see also Drug Addiction, Drugs)
6043, 6269, 6272, 6276, 6277, 6278, 6279, 6280, 6282, 6283, 6284, 6285, 6286, 6304, 6827, 6929, 7045, 7232
- Drug Therapy**
6922, 6985, 7017, 7018, 7019, 7020, 7021, 7022, 7023, 7024, 7025, 7026, 7028, 7029, 7030, 7031, 7033, 7034, 7035, 7036, 7037, 7038, 7039, 7040, 7041, 7042, 7043, 7044, 7045, 7088, 7229, 7233, 7284, 7285, 7287, 7288, 7290, 7298, 7311, 7312, 7313
- Drug Therapy-Schizophrenia**
7016, 7032, 7207, 7209, 7221, 7222
- Drug Usage & Abuse** (see also Drug Addiction, Drugs)
6304, 6826, 6828, 6829, 6830, 6831, 6832, 6835, 6837, 6839, 7087, 7185, 7232
- Drugs** (see also Amphetamine, Antidepressant Drugs, Chlorpromazine, Marijuana, Tranquilizer)
Diethylamide, 7018, 7021, 7027, 7031, 7036, 7039, 6285, 7018, 7021, 7027, 7031, 7036, 7039
- Dyad** (SEE Group/Small, Interpersonal Processes)
- Dyslexia** (SEE Reading Deficiency)
- Ear** (see also Audition)
5990, 6034, 6188, 6228, 6238, 6254, 6259, 6260, 6263, 7268
- Eating** (SEE Food, Food Intake)
- Ecology** (SEE Environment)
- Education** (see also next headings, College, Curriculum, School, Teaching, Training)
5981, 6552, 7261, 7386, 7388, 7393, 7395, 7399, 7411, 7885
- Education/Adult** (SEE Education)

- Generalization** 6094, 6112, 6118, 6418, 6421, 7053, 7219
- Generalization/Stimulus** (SEE Transfer, Generalization)
- Genetics** 6277, 6358, 6359, 6462, 6912, 7022, 7141, 7206, 7289, 7319, 7338
- Genetics-Animal** 6359, 6360, 6367, 6373, 6406, 6434, 6464
- Genius** (SEE Gifted)

BRIEF SUBJECT INDEX

Geriatrics (see also Gerontology)
7381, 7382, 7383, 7384, 7385

Germany
6899

Gerontology (see also Geriatrics)
6630, 6632, 6634, 6635, 6637, 6654, 7384

Gestalt Psychology
7784

Gifted
6538, 6590, 7418

Gland (see also Epinephrine, Hormone)
6190, 6230, 6273, 6287, 7233, 7368

Goal (SEE Motivation)

Goodenough Test (SEE Projective Technique)

Government
6646, 6647, 6652, 7140, 7339

Grades & Grade-Point Average (SEE Achievement/Academic, Achievement/Academic-College, Achievement/Academic-Elementary School)

Grammar
6140, 6511, 6523, 6542, 7265, 7292, 7768

Graphology (SEE Writing)

Great Britain
6670, 6887, 6930, 7683

Group (see also next headings, Community, Culture, Interpersonal Processes)
6543, 6582, 6641, 6728, 6729, 6731, 6737, 6741, 6743, 6751, 6755, 6760, 6762, 6766, 6769, 6772, 6773, 6775, 6778, 6846, 6876, 6900, 6903, 6917, 6950, 7181, 7182, 7317, 7414, 7447, 7502, 7538, 7548, 7554, 7557, 7560, 7561, 7562, 7563, 7565, 7566, 7574, 7581, 7598, 7643, 7650, 7652, 7741, 7870, 7908, 7913, 7914

Group Discussion
6592, 6672, 6735, 6753, 6757, 6778, 7047, 7510, 7547

Group Dynamics
6728, 6730, 6735, 6743, 6754, 6756, 6758, 6764, 6769, 6770, 6780, 6876, 6992, 7548, 7562, 7913

Group Influence (SEE Social Influence)

Group Structure (SEE Group, Role)

Group Therapy (SEE Psychotherapy/Group)

Group/Ethnic (SEE Ethnicity)

Group/Small (see also Interpersonal Processes)
6731, 6747, 6764, 6771, 6783, 6800, 7149, 7547, 7763, 7905

Guidance (SEE next headings, Counseling)

Guidance/Child (SEE Psychotherapy/Children Guidance Educational)

Guidance/Educational
7195, 7198, 7457, 7537, 7539, 7542, 7552, 7553, 7556, 7557, 7560, 7561, 7562, 7563, 7572, 7576, 7578, 7580, 7586, 7587, 7588, 7593, 7596, 7597, 7604

Guidance/Vocational
7543, 7550, 7567, 7568, 7573, 7575, 7579, 7584, 7589, 7599, 7853, 7854, 7856, 7858

Guilt (SEE Emotion, Motivation)

Guinea Pig (SEE Animals)

Gustation (SEE Taste)

Habit (SEE Learning, Extinction)

Habituation
6108, 6177, 6234, 6250, 6273, 6470

Malnutrition
6002, 6915, 7169, 7235, 7367

Hallucinogen (SEE Drugs, Lysergic Acid Diethylamide)

Halo Effect (SEE Rating Scale)

Hand (see also Body, Motor Performance)
6086, 6245, 7347

Handedness (SEE Laterality)

Handicap (SEE Childhood/Handicapped, Physical Handicap, Blindness, Deafness & Hearing Disorder)

Handling (see also Experience/Early)
6381

Handwriting (SEE Writing)

Headache (SEE Illness)

Hearing (SEE Audition)

Hearing Loss (SEE Audition, Deafness &

Hearing Disorder

Hearing/Hard of (SEE Deafness & Hearing Disorder)

Heart (see also Blood, Blood-Animal, Blood Pressure, Cardiovascular Processes, Heart Rate)
6186, 6356

Heart Rate
5980, 6061, 6068, 6072, 6088, 6186, 6233, 6326, 6342, 6344, 6345, 6353, 6466, 7129, 7159, 7222

Heat (SEE Temperature)

Height (SEE Physique)

Helping Behavior (SEE Interpersonal Processes)

Heredity (SEE Genetics)

High School (SEE School, Student/High School, Adolescence)

Higher Education (SEE College)

Hippocampus
6199, 6203, 6204, 6210, 6224, 6230, 6240, 6250, 6306

History (see also Psychology/History of)
5945, 6639, 7315

Hoarding (SEE Instinctive Behavior)

Homicide (SEE Crime & Criminals, Suicide)

Homosexuality
6972, 6990, 7131, 7132, 7149, 7150, 7151, 7575

Honesty (SEE Deception)

Hormone (see also Epinephrine)
6043, 6182, 6184, 6187, 6230, 6273, 6274, 6275, 6294, 6318, 6334, 6337, 6350, 6354, 6357, 6362, 6381, 7233, 7285, 7368

Hospital & Hospitalization (see also Clinic, Institution & Institutionalization, Mental Hospital & Hospitalization)
6600, 7049, 7053, 7059, 7061, 7093, 7099, 7105, 7258, 7294, 7325, 7369, 7867

Hostility (see also Aggression)
6647, 6657, 6840, 6847, 7037, 7613

Hue (SEE Color)

Human Engineering (SEE Engineering Psychology)

Humor (see also Literature, Language, Emotion)

Hunger (SEE Food Deprivation, Motivation)

Husband (SEE Marriage)

Hypnosis

Hypnotherapy (SEE Hypnosis, Psychotherapy/Methods in)

Hypothalamus
6187, 6205, 6209, 6210, 6214, 6219, 6222, 6223, 6230, 6235, 6274, 6306, 6332

Hysteria & Hysterics (see also Mental Disorder, Neurosis, Psychosis)
6905, 6972, 7176, 7182, 7231, 7319

Id (SEE Psychoanalytic Theory)

Identification
6168, 6171, 6363, 6544, 6791, 6796, 6844, 7139, 7276, 7593

Identity
6567, 6614, 6838, 6846, 7181

Illegitimate Pregnancy (SEE Pregnancy, Mother)

Illness (see also Disease)
6005, 6361, 6923, 7014, 7069, 7122, 7225, 7260, 7357, 7358, 7359, 7363, 7368, 7370, 7371, 7372, 7886

Illumination (SEE Brightness, Environment)

Illusion
5994

Image (see also Self-Perception, Social Perception, Body)

Imagery
6062, 6117, 6127, 6133, 6140, 6143, 6997, 7270

Imagination (SEE Fantasy, Cognition, Thinking)

Imitation (see also Instinctive Behavior, Interpersonal Processes, Model)

6128, 6507, 6573, 6574, 6575, 6581, 7181, 7219, 7326, 7588

Impression Formation (SEE Social Perception)

Imprinting (SEE Instinctive Behavior, Experience/Early)

Incentive (see also Motivation, Reward, Reinforcement)
6173, 6387, 6715, 7000, 7091, 7167

Incest (SEE Sexual Deviation)

Incidental Learning (SEE Learning)

Income (SEE Money, Socioeconomic Status)

Independence (SEE Dependency)

India
5945, 6669, 6799

Indian/American (SEE Ethnicity)

Individual Differences
6056, 6113, 6755, 7768, 7792, 7862

Industrial Psychology (see also Business, Personnel/Industrial)
7879, 7909, 7923

Industry (SEE Business, Personnel/Industrial)

Infancy (see also Neonate)
6381, 6469, 6470, 6471, 6472, 6473, 6474, 6475, 6600

Influence (SEE Interpersonal Influence, Persuasion, Social Influence)

Information (see also Communication, Information Theory, Language)
5965, 5977, 5979, 5981, 5982, 6017, 6019, 6030, 6043, 6066, 6081, 6082, 6088, 6092, 6093, 6096, 6141, 6154, 6167, 6168, 6540, 6551, 6688, 6698, 6701, 6788, 6794, 6829, 6868, 6944, 7572, 7576, 7717, 7734, 7880

Information Retrieval (SEE Information, Computer)

Information Theory (see also Information)
6807

Inheritance (SEE Genetics)

Inhibition (see also Extinction, Interference)
6079, 6122, 6129, 6198, 6216, 6335, 6400, 6408, 6665

Inkblot (SEE Projective Technique, Rorschach Test)

Insect
6463

Insecurity (SEE Dependency, Neurosis)

Insight (SEE Problem Solving, Thinking, Self-Perception, Social Perception, Therapeutic Process)

Instinctive Behavior (see also Sexual Behavior/Animal)
6318, 6357, 6369, 6379, 6382, 6383, 6384, 6385, 7067, 7132

Institute (SEE Organizations, College)

Institution & Institutionalization (see also Hospital & Hospitalization, Mental Hospital & Hospitalization)
6543, 6634, 6974, 6989, 7048, 7050, 7143, 7323, 7327, 7332, 7335, 7339, 7380, 7382, 7383, 7384, 7385, 7495, 7657

Instruction (see also Teaching)
6189, 6486, 6662, 6755, 6808, 7819

Instructions/Experimental
1990, 6013, 6062, 6072, 6102, 6105, 6106, 6120, 6122, 6150, 6172, 6233, 6843, 7328, 7398, 7464

Insulin (SEE Hormone)

Insult Shock Therapy (SEE Therapy)

Integration
6482, 6531, 6547, 6608, 7406, 7408, 7419, 7427

Intellectual Processes (SEE Cognition, Thinking)

Intelligence (see also next headings)
6181, 6475, 6479, 6480, 6479, 6479, 6531, 6532, 6539, 6543, 6610, 6635, 6659, 6812, 6878, 6879, 7079, 7226, 7229, 7363, 7378, 7380, 7415, 7421, 7450, 7464, 7576, 7604, 7673, 7677, 7683, 7688, 7700, 7719, 7720, 7733, 7741, 7758, 7791, 7820

Intelligence Quotient
6594, 7462, 7502, 7513, 7556, 7639

Intelligence Tests & Testing (SEE Test/Intelligence)

Intensity (SEE Stimulus Intensity, Shock & Shock Intensity)

Interest (see also Motivation)

BRIEF SUBJECT INDEX

6155, 6580, 6604, 7543, 7567, 7685, 7708, 7801
Interest/Vocational (SEE Occupational Interest)
Interference
 6092, 6124, 6139, 6141, 6147, 6148, 6152, 6870, 7696, 7703
Internal-External Control (SEE Control/Internal-External)
International Relations
 6640, 6641, 6647, 6707
Interpersonal Attraction
 6572, 6578, 6580, 6583, 6676, 6678, 6717, 6721, 6726, 6733, 6739, 6745, 6748, 6754, 6761, 6768, 6777, 6790, 6794, 6795, 6869, 6983, 7199
Interpersonal Influence
 6674, 6724
Interpersonal Perception (SEE Social Perception)
Interpersonal Processes (see also Interpersonal Attraction, Interpersonal Influence, Group, Social Processes, Family Relations)
 6577, 6626, 6669, 6696, 6713, 6725, 6727, 6728, 6729, 6733, 6734, 6735, 6736, 6738, 6740, 6742, 6744, 6745, 6746, 6747, 6749, 6750, 6752, 6756, 6757, 6759, 6763, 6765, 6767, 6770, 6771, 6776, 6781, 6782, 6783, 6786, 6789, 6804, 6805, 6813, 6833, 6855, 6860, 6861, 6868, 6874, 6902, 6935, 6951, 6983, 6988, 6996, 6998, 7058, 7108, 7138, 7170, 7175, 7178, 7249, 7250, 7251, 7406, 7417, 7450, 7531, 7538, 7555, 7562, 7563, 7565, 7582, 7587, 7588, 7597, 7598, 7604, 7633, 7646, 7647, 7659, 7671, 7763, 7771, 7823, 7834, 7863, 7872
Interresponse Interval (SEE Interval/Time)
Intersensory Processes
 5993, 6399, 7470, 7701
Interval/Interstimulus
 5992, 5996, 6011, 6033, 6083, 6089, 6107, 6120, 6121, 6146, 6408, 7279
Interval/Time
 6065, 6081, 6145, 6153, 6217, 6268, 6284, 6395, 6438, 6489, 7266, 7458
Interview & Interviewing (see also Counseling, Guidance/Educational, Guidance/Vocational, Psychotherapy)
 5980, 6569, 6739, 6746, 6788, 6802, 7002, 7071, 7246, 7370, 7558, 7590, 7862, 7866
Introversiion (SEE Extroversion-Introversiion)
Intuition (SEE Thinking, Cognition)
Inventory (see also Questionnaire, Survey)
 6893, 7670, 7852
Isolation (see also Alienation)
 6137, 6385, 6454, 6457, 6502, 6891
Israel
 6543
Item (see also Test & Testing, Testing Methods)
 5972, 7396, 7441, 7449, 7454, 7461, 7852
Japan
 6639, 6672, 7090, 7213
Jew (SEE Religion, Ethnology)
Job (SEE next headings, Occupation, Personnel/Industrial Work & Work Analysis)
Job Evaluation (SEE Occupation, Work & Work Analysis)
Job Performance
 6938, 7154, 7250, 7262, 7610, 7611, 7627, 7640, 7855, 7863, 7871, 7878, 7882, 7883, 7884, 7885, 7887, 7889, 7890, 7905
Job Satisfaction
 7243, 7250, 7619, 7640, 7648, 7855, 7881, 7886, 7912
Judgment
 5997, 6073, 6084, 6560, 6588, 6615, 6724, 6791, 6819, 7385, 7555, 7630
Judgment/Perceptual (see also Perception, the various senses)
 5989, 5997, 6010, 6018, 6019, 6035, 6285, 6582
Junior College (SEE College)
Junior High School (SEE School, Student/

Junior High School)
Juvenile Delinquency (SEE Delinquency/Juvenile)
Kibbutz/Israel (SEE Israel)
Kindergarten (SEE Childhood/Preschool)
Kinesthesia (see also Movement)
 5995, 6540
Kinship (SEE Family, Culture)
Knowledge of Results (SEE Feedback, Reinforcement, Information)
Korsakov's Psychosis (SEE Alcoholism, Brain Disorder)
Labor Relations (SEE Personnel/Industrial, Management)
Language (see also next headings, Communication, Information, Speech, Psycholinguistics, Verbal Behavior)
 5979, 6039, 6077, 6154, 6159, 6458, 6484, 6521, 6528, 6811, 6812, 6814, 6815, 6817, 6820, 7142, 7257, 7277, 7292, 7354, 7425, 7491, 7630, 7747, 7768
Language Development
 6479, 6502, 6507, 6508, 6511, 6512, 6520, 6527, 6542, 6552, 7498
Language/Foreign
 5962, 5987, 6077, 6812, 6814, 6817, 6875, 7478, 7689, 7710, 7740, 7801
Latent Learning (SEE Learning)
Laterality
 6025, 6032, 6033, 6036, 6037, 6079, 6085, 6245, 6540, 7080, 7347
Latin America
 5946, 5950, 5987, 6610, 6629, 6677, 6682, 7100, 7156, 7753, 7818
Law (see also Government, Political Behavior)
 5960, 6702, 6826, 6919, 7136, 7140, 7431
Leadership (see also Management)
 5945, 6652, 6730, 6734, 6753, 6762, 6766, 6772, 6800, 7421, 7428, 7436, 7437, 7588, 7606, 7614, 7647, 7883, 7893, 7899, 7902, 7903, 7912
Learning (see also next headings, Association, Conditioning, School Learning, Rat/Learning in, Monkey/Learning in, Cat/Learning in, Childhood/Learning in)
 6024, 6095, 6096, 6100, 6108, 6127, 6142, 6267, 6349, 6379, 6386, 6397, 6400, 6401, 7562, 7812, 7875, 7876
Learning Disorders
 7454, 7463, 7488, 7496, 7503, 7509, 7514, 7517, 7521, 7522, 7524, 7529, 7713
Learning Model (SEE Model)
Learning Set (SEE Set, Expectation)
Learning Theory
 7003, 7145
Learning Transfer
 6126, 6265, 6266, 6267, 6268, 6312, 6395, 6400, 6414, 6429, 6498, 7349, 7781
Learning/Avoidance (see also Rat/Avoidance & Avoidance Learning in)
 6109, 6217, 6266, 6288, 6302, 6307, 6312, 6324, 7001
Learning/Discrimination (see also Discrimination Reversal, Rat Discrimination in)
 6115, 6117, 6192, 6296, 6414, 6416, 6417, 6446, 6486, 6499, 7348, 7493, 7525
Learning/Escape (SEE Escape)
Learning/Incidental (SEE Learning)
Learning/Instrumental (SEE Conditioning/Operant Rat Conditioning in)
Learning/Maze (see also Rat/Maze Learning in)
 6211, 6265, 6402, 6406
Learning/Motor
 6047, 6100, 6101, 6562, 7467, 7715, 7785
Learning/Over (SEE Learning)
Learning/Repeated Associate
 6099, 6120, 6121, 6122, 6123, 6124, 6125, 6126, 6127, 6134, 6139, 6497, 6857, 6997, 7218, 7301, 7342, 7343, 7735
Learning/Probability

6097, 6098, 6165, 6564
Learning/Reversal (see also Discrimination Reversal)
 6198
Learning/Serial
 6113, 6114, 6119, 6494, 7714
Learning/Verbal (see also Learning/Verbal Associate)
 6110, 6113, 6115, 6116, 6117, 6118, 7053, 7212, 7523, 7646, 7697, 7701
Legibility (SEE Display, Writing)
Leisure (SEE Recreation)
Lesion (see also Brain Lesion, Brain Lesion, Animal, Rat/Lesions in, Cat/Lesions in)
 6177, 6186, 6190
Liberalism (SEE Political Behavior, Personality Trait)
Licensing (SEE Law)
Light (see also Brightness, Color)
 5998, 6004, 6028, 6098, 6210, 6311, 6312, 6398, 6421
Light Adaptation (SEE Adaptation, Sensory)
Lighting (SEE Brightness, Environment)
Liking (SEE Interpersonal Attraction)
Linguistics (SEE Language, Psycholinguistics)
Listening (SEE Attention, Audition, Speech Perception)
Literature
 5944, 6625, 6627, 6690, 6824, 6825, 7768, 7820
Lobotomy (SEE Brain Lesion, Brain Lesion, Animal)
Localization
 5992
Logic (see also Thinking)
 6517, 7381
Loneliness (SEE Isolation, Alienation)
Longitudinal Study (SEE Experimental Design)
Loudness (SEE Audition, Noise, Sound)
Love (SEE Emotion)
Lower Class (SEE Socioeconomic Status)
LSD (SEE Lysergic Acid Diethylamide)
Luminance (SEE Brightness, Intensity)
Lying (SEE Deception)
Lysergic Acid Diethylamide
 6277, 6289, 6296, 6310, 6311, 6824, 6825, 6831, 6839, 7021, 7022
MA Scale (SEE Anxiety)
Machine (SEE Apparatus)
Man-Machine Systems (SEE Engineering, Psychology)
Management (see also Business, Leadership)
 6645, 7256, 7851, 7868, 7870, 7874, 7875, 7888, 7891, 7893, 7894, 7895, 7896, 7901, 7902, 7903, 7904, 7905, 7906, 7908, 7909, 7911, 7912, 7913
Mania (SEE Mental Disorder, Personality Disturbance)
Manic-Depressive Psychosis (SEE Depression, Psychosis)
Manifest Anxiety (SEE Anxiety)
Marijuana
 6281, 6283, 6304, 6826, 6827, 6828, 6829, 6831, 6834, 6839, 7212
Marital Problems (see also Family Therapy)
 6680, 7252
Marketing & Marketing Research (SEE Consumer Behavior)
Marriage (see also Family, Sexual Behavior)
 6593, 6637, 6656, 6660, 6711, 6712, 6713, 6679, 6680, 6685, 6687, 6690, 7261, 7262, 7192, 7255, 7641
Masculinity (SEE Sex Role)
Masking (see also Interference)
 6015, 6027, 6033, 6034, 6036, 6037, 6038, 6158, 6253, 6256, 6260, 7271
Masochism (SEE Sexual Deviation)
Mass Behavior (SEE Group, Social Behavior, Human)
Mass Media (SEE Communication, Mass)
Maternal Behavior (see also Mother, Parent-Child Relations, Child Rearing)
 6195, 6275, 6344, 6462

- Nondirective Therapy** (SEE Psychotherapy Methods in)
- Nonsense & Nonsense Syllables** (SEE Association, Learning/ Paired Associate, Word)
- Nonverbal Communication** (SEE Communication/Nonverbal)
- Noradrenalin** (SEE Hormone)
- Norepinephrine** (SEE Hormone)
- Norm** (see also Value & Values, Social Influence)
6577, 6696, 7882

- Peer Rating** (SEE Peers)
- Peers**
6568, 6578, 6579, 6583, 6584, 6585, 6613, 6623, 6626, 6656, 6724, 6874, 7144, 7146, 7173, 7259, 7326, 7403, 7406, 7418, 7519, 7566, 7793, 7824
- Penitentiary** (SEE Prison)
- Perception** (see also next headings, Intersensory Processes, Childhood/Perception in)
5978, 6040, 6081, 6148, 6164, 6865, 7095
- Perception/Auditory** (SEE Auditory Perception)
- Perception/Depth**
6006, 6010, 6020, 6021, 7344, 7690, 7915, 7916
- Perception/Form & Shape**
5993, 6013, 6016, 6023, 6135, 6546, 6606, 7322, 7915
- Perception/Size**
5991, 5994, 6010, 6018, 6019, 6020, 6863, 7915
- Perception/Social** (SEE Social Perception)
- Perception/Space**
6008, 6012, 6406, 6510, 6550, 7802, 7841
- Perception/Time**
5996, 5997, 5998, 7279
- Perception/Visual** (SEE Visual Perception)
- Perception/Weight** (SEE Weight, Perception)
- Perceptual Defense** (SEE Defense Mechanism)
- Perceptual Isolation** (SEE Isolation, Deprivation/Sensory)
- Performance** (see also Job Performance, Motor Performance)
6772, 6866
- Perseveration** (SEE Personality Trait, Thinking)
- Personality** (see also next headings, Childhood/Personality in, Teacher Attitudes & Personality, the various personality traits)
6359, 6607, 6619, 6639, 6641, 6767, 6849, 6857, 6867, 6885, 6947, 7017, 7081, 7094, 7134, 7371, 7455, 7708, 7885, 7918
- Personality Change**
6052, 6562, 6737, 6843, 7088, 7282, 7539
- Personality Correlates**
6025, 6363, 6858, 6863, 6889, 7577, 7598, 7858
- Personality Diagnosis** (SEE Personality Measurement, Test/Personality)
- Personality Disorder** (SEE Emotional Disturbance, Neurosis)
- Personality Inventory** (SEE Personality Measurement)
- Personality Measurement**
6559, 6885, 6886, 6889, 6902, 6998, 7921
- Personality Test** (SEE Test/Personality)
- Personality Theory**
5947, 6557, 6841, 6853, 6854, 7081, 7990
- Personality Trait** (see also Inventory)
6465, 6785, 6790, 6839, 6845, 6852, 6853, 6860, 6862, 6873, 6874, 6886, 6898, 6905, 6931, 6942, 7086, 7102, 7151, 7164, 7372, 7375, 7401, 7428, 7495, 7467, 7603, 7607, 7608, 7611, 7716, 7789, 7853, 7889, 7902
- Personality/Assessment of** (SEE Personality Measurement)
- Personality/Childhood** (SEE Childhood Personality in)
- Personnel** (see also next headings)
6724, 7866, 7889, 7890, 7892
- Personnel/Industrial**
6645, 7237, 7862, 7868, 7872, 7877, 788, 7886, 7887, 7892, 7899, 7902, 7905, 7907, 7923
- Personnel/Military**
6304, 6640, 6887, 7154, 7168, 7430, 7893, 7908, 7914, 7922
- Personnel/Psychological** (see also Counselor Nurse, Psychiatrist, Psychologist, Therapist)
6932, 6933, 6934, 6935, 6939, 6941, 6948, 7056, 7316, 7376, 7387, 7549
- Persuasion** (see also Interpersonal Influence, Social Influence)
6714, 6719, 7794, 7918
- Phenomenology**
6638
- Phenylketonuria** (SEE Genetics, Mental Disorder, Mental Retardation)
- Philosophy** (see also Existentialism)
5947, 5948, 5953, 6652, 6919, 6992, 7244, 7257, 7594, 7792
- Phobia** (see also Anxiety, Fear)
7013
- Phoneme** (SEE Word, Language)
- Phonetics** (SEE Speech, Verbal Behavior Language)
- Phone** (SEE Light)
- Photograph** (SEE Picture)
- Physical Education** (SEE Education-Physical)
- Physical Handicap** (see also Blindness, Childhood/Handicapped, Deafness & Hearing Disorder, Motor Disorder)
6802, 7240, 7259, 7260, 7261
- Physical Therapy** (SEE Occupational & Physical Therapy)
- Physician**
6686, 6937, 6944, 6945, 6947, 7018, 7093, 7378, 7859
- Physiological Correlates** (see also Stress Physiological)
6164, 6182
- Physiological Psychology**
6180
- Physiology** (see also Electrophysiology)
5963, 6176, 6366
- Physiology/Sensory** (see also Vision/Physiology of)
6232, 6258, 6259
- Physique** (see also Body)
6005, 6041, 6366, 6475, 6613, 6635, 7181, 7249, 7318, 7340, 7492, 7783
- Piaget/J.** (SEE Childhood/Concepts & Problem Solving in, Childhood/Development in)
- Picture**
6135, 6648, 7445, 7690
- Picture-Frustration** (SEE Projective Technique)
- Pigeon**
6191, 6197, 6198, 6217, 6258, 6305, 6331, 6400, 6409, 6416, 6417, 6418, 6426, 6431, 6436, 6439, 6440, 6443, 6450, 6452
- Pilot** (SEE Aviation, Personnel/Military)
- Pitch** (SEE Sound, Audition)
- Pituitary** (SEE Gland, Hormone)
- PK** (SEE Parapsychology)
- Placebo** (SEE Drug Effects)
- Play** (SEE Childhood/Social Behavior in, Game, Recreation)
- Play Therapy** (SEE Psychotherapy/Children)
- Pleasure** (SEE Emotion)
- Poisson Distribution** (SEE Statistics)
- Police** (SEE Crime & Criminals, Law)
- Political Behavior**

BRIEF SUBJECT INDEX

6640, 6647, 6675, 6703, 6716, 6764, 6799, 7412, 7420, 7600

Politics (SEE Political Behavior, Government)

Pollution (SEE Environment)

Popularity (SEE Interpersonal Attraction, Social Approval)

Population Characteristics
6049, 6373, 6649, 6758, 7094, 7269, 7745

Population Control (SEE Birth Control)

Porteus Maze (SEE Learning/Maze, Apparatus)

Potential/Evoked (see also Electrical Activity)
6215, 6232, 6243, 6244, 6245, 6246, 6247, 6248, 6249, 6252, 6255

Poverty (SEE Socioeconomic Status, Childhood/Disadvantaged)

Power (SEE Dominance, Social Influence)

Practice
6120, 6354

Precondition (SEE Parapsychology)

Prediction (see also Achievement/Prediction of Academic)
6481, 6809, 6812, 6813, 6860, 7116, 7262, 7297, 7299, 7460, 7866, 7889

Preference
5988, 6008, 6032, 6069, 6085, 6129, 6318, 6372, 6377, 6379, 6482, 6485, 6578, 7322, 7385, 7417, 7423, 7465, 7593, 7701, 7724, 7920

Pregnancy
6277, 6380, 6466, 6961, 6981, 7122, 7152, 7333, 7363

Prejudice
6482, 6663, 6698, 6708, 6791, 7612

Prenatal (SEE Pregnancy)

Preschool Children (SEE Childhood/Preschool)

Presentation Rate (SEE Interval/Interstimulus)

Prestige (SEE Socioeconomic Status)

Prison (see also Crime & Criminals)
7130, 7132

Prison Inmate (SEE Prison)

Probability (see also Learning/Probability, Statistics)
5970, 5972, 5996, 6083, 6084, 6090, 6175, 6345, 6785, 7392, 7501

Probability Learning (SEE Learning/Probability)

Problem Solving (see also Choice Behavior, Decision Making, Childhood/Concepts & Problem Solving in)
6161, 6163, 6164, 6166, 6171, 6172, 6399, 6753, 6762, 6872, 6883, 7426, 7439, 7726, 7781

Profile (SEE Score & Scoring)

Programed Instruction (see also Teaching Aids)
7396, 7481, 7486, 7490, 7717, 7808, 7809, 7813, 7815, 7816, 7835, 7845, 7850

Programming (SEE Computer)

Projection (SEE Defense Mechanism, Cerebral Cortex, Visual Cortex)

Projective Technique (see also Rorschach Test)
6555, 6563, 6565, 6566, 6609, 6620, 6888, 6895, 6896, 6897, 6898, 6899, 6900, 6901, 6902, 6903, 6904, 6905, 6906, 6949, 7068, 7149, 7161, 7181, 7253, 7371, 7513, 7527, 7556, 7590

Propaganda (SEE Communication, Communication/Mass, Persuasion)

Proprioception (SEE Kinesithesis, Somesthesia)

Prostitution (SEE Occupation, Sexual Behavior)

Protestantism (SEE Religion)

Psychedelic Experience (SEE Drug Effects-Human)

Psychiatric Diagnosis (SEE Psychodiagnosis)

Psychiatric Hospital (SEE Mental Hospital & Hospitalization)

Psychiatric Patient (see also Patient)
6976, 6985, 6996, 7051, 7062, 7069, 7072, 7074, 7078, 7079, 7084, 7153, 7154, 7155, 7156, 7158, 7163, 7164, 7165, 7173, 7179, 7217, 7299

Psychiatric Patient Treatment (see also Case Report-Treatment, Treatment/Outpatient)
6988, 7022, 7047, 7048, 7050

Psychiatric Ward (SEE Mental Hospital & Hospitalization)

Psychiatrist
6942, 6950, 6953, 6971, 7059

Psychiatry (see also Psychotherapy, Child Psychiatry)
6914, 6920, 6921, 6925, 6969, 7070, 7078

Psychiatry Abroad
6930

Psychoanalysis (see also next headings)
6607, 6940, 6942, 6953, 6959, 6966, 6967, 6971, 6972, 7064

Psychoanalyst (SEE Psychiatrist)

Psychoanalytic Interpretation
5945, 6644, 6650, 7064, 7066

Psychoanalytic Theory
5944, 6044, 6358, 6552, 6590, 6840, 6982, 7065, 7067

Psychoanalytic Therapy (SEE Psychoanalysis)

Psychodagnosis (see also Clinical Judgment, Diagnosis, Diagnosis/Differential, Mental Retardation/Diagnosis of, Schizophrenia/Diagnosis of)
6894, 6925, 7069, 7070, 7071, 7072, 7073, 7074, 7076, 7077, 7078, 7079, 7080, 7081, 7082, 7083, 7084, 7154, 7176, 7274, 7291, 7301, 7304, 7306, 7307, 7308, 7368, 7599

Psychodrama (SEE Psychotherapy/Group, Psychotherapy/Methods in)

Psychokinesis (SEE Parapsychology)

Psycholinguistics
6479, 6484, 6507

Psychologist

Psychology
5952, 5953, 5956, 5958, 5959, 5960, 5962, 5986, 6667, 7818

Psychology Abroad
5950, 5959, 5960, 5961

Psychology/History of
5946, 5954, 7049, 7157

Psychometrics (SEE Test & Testing, Statistics)

Psychomotor Performance (SEE Motor Performance)

Psychoneurosis (SEE Neurosis)

Psychopathology
6780, 6927, 6965, 7127, 7206, 7364

Psychopathy (SEE Mental Disorder)

Psychopharmacology (SEE Drug Effects, Drug Therapy, Biochemistry)

Psychophysics
5967, 6018, 6084, 6757

Psychophysiology (SEE Physiological Psychology)

Psychosis & Psychotics (see also Mental Disorder, specific psychoses)
6304, 6559, 6916, 6928, 6980, 7009, 7019, 7023, 7024, 7025, 7037, 7039, 7041, 7076, 7083, 7172, 7186, 7187, 7188, 7235, 7287

Psychosis/Children (SEE Childhood/Psychosis in)

Psychosomatic Disorder
6871, 6923, 6928, 6966, 7014, 7174, 7223, 7224, 7225, 7226, 7227, 7228, 7360

Psychosomatic Medicine (SEE Psychosomatic Disorder, Medicine)

Psychotherapist (SEE Therapist)

Psychotherapy (see also next headings, Behavior Therapy, Drug Therapy, Family Therapy, Psychiatry, Psychoanalysis, Therapy, Treatment)
6951, 6954, 6956, 6960, 6961, 6962, 6965, 6967, 6968, 6970, 6973, 6975, 6993, 7075, 7081, 7176, 7192, 7310

Psychotherapy/Children
6957, 6959, 6967, 6995, 7010, 7013, 7522, 7564

Psychotherapy/Client Centered (SEE Psychotherapy/Methods in)

Psychotherapy/Group (see also Family Therapy)
6778, 6963, 6967, 6977, 6978, 6979, 6980, 6981, 6982, 6983, 6984, 6986, 6988, 6989, 6990, 6991, 6992, 6993, 6994, 6995, 6996, 7088, 7089, 7092, 7112, 7116, 7144, 7234, 7294, 7596, 7604

Psychotherapy/Methods in
6940, 6955, 6963, 6964, 6967, 6980, 6986,

6989, 7011, 7012, 7013, 7014, 7015, 7092, 7188, 7220, 7224, 7230, 7231

Psychotherapy/Research in
6062, 6951, 6952, 6954, 6958, 6969, 6976, 6979, 6986, 6993, 6995, 6997, 6998, 7001, 7002, 7005, 7081

Psychotherapy/Short Term

Puberty (SEE Adolescence)

Public Opinion (SEE Opinion)

Puke (SEE Cardiovascular, Processes, Heart Rate)

Punishment
6109, 6370, 6450, 6457, 7353

Pupil Size (SEE Eye)

Q-Sort (SEE Test/Personality, Personality Measurement)

Questionnaire (see also Inventory, Scale, Survey)
6686, 6700, 7436, 7903, 7904

Rabbit
6206, 6240, 6243, 6292, 6337, 6349

Race (SEE Ethnology)

Race Relations (SEE Integration, Social Movements)

Radiation
6312, 6349, 7368

Radio (SEE Communication/Mass)

Ranking (SEE Measurement, Scale, Scaling)

Rapid Eye Movement (see also Dream & Dreaming, Sleep)
6043, 6145, 6251, 6276, 7032

Rat (see also next headings)
6250, 6275, 6368, 6372, 6375, 6454

Rat/Activity in
6199, 6203, 6271, 6274, 6300, 6317, 6327, 6380, 6381, 6388, 6390, 6396, 6425

Rat/Avoidance & Avoidance Learning in
6273, 6293, 6301, 6316, 6350, 6376, 6393, 6396, 6413, 6437

Rat/Brain Stimulation in
6205, 6207, 6209, 6213, 6219, 6223, 6327

Rat/Conditioning in
6291, 6322, 6345, 6389, 6407, 6408, 6410, 6411, 6412, 6413, 6424, 6425, 6433, 6441, 6445

Rat/Deprivation in
6199, 6271, 6317, 6341, 6390, 6391

Rat/Discrimination in
6291, 6310, 6395, 6411, 6415, 6419, 6420, 6422, 6442

Rat/Drug Effects in
6178, 6193, 6206, 6207, 6230, 6274, 6287, 6289, 6291, 6293, 6294, 6300, 6301, 6303, 6308, 6309, 6311, 6313, 6314, 6316, 6317, 6319, 6320, 6321, 6322, 6323, 6325, 6326, 6327, 6328, 6330, 6335, 6336, 6340

Rat/Extinction in
6293, 6407, 6412, 6420, 6422, 6424, 6438, 6444, 6447, 6448, 6449

Rat/Learning in
6178, 6264, 6268, 6395, 6396, 6407, 6415, 6422, 6427, 6432, 6433, 6438, 6442

Rat/Lesions in
6189, 6193, 6199, 6201, 6203, 6230, 6273, 6274, 6287, 6321

Rat/Maze Learning in
6419

Rat/Motivation in
6309, 6316, 6340, 6344, 6364, 6387, 6388, 6389, 6390, 6391, 6392, 6393, 6424, 6430, 6441, 6457

Rat/Reinforcement & Reinforcement Schedule in
6178, 6205, 6213, 6289, 6314, 6410, 6411, 6413, 6415, 6419, 6420, 6422, 6425, 6427, 6430, 6432, 6433, 6435, 6437, 6438, 6441, 6442, 6444, 6445, 6447, 6448, 6449

Rat/Shock & Shock Effects in
6187, 6303, 6316, 6340, 6345, 6392, 6407

Rat/Stress Effects in
6350, 6356

- Rating** (see also Rating Scale)
7601, 7669, 7909
- Rating Scale**
7607, 7754
- Reaction Time**
5980, 6053, 6088, 6089, 6090, 6091, 6092, 6093, 6094, 6156, 6242, 6536, 7296, 7307, 7324, 7329
- Readability** (SEE Display, Writing)
- Reading**
6468, 6627, 7184, 7248, 7273, 7404, 7469, 7472, 7474, 7481, 7486, 7505, 7564, 7675, 7680, 7687, 7692, 7699, 7701, 7712, 7717, 7719, 7723, 7725, 7727, 7729, 7736, 7738, 7743, 7747, 7748, 7799, 7803, 7805, 7813, 7820, 7821, 7824, 7826, 7865
- Reading Deficiency** (see also Education/Special-Remedial)
7274, 7296, 7391, 7468, 7475, 7485, 7498, 7506, 7514, 7517, 7527, 7529, 7534, 7564, 7683, 7717, 7756, 7758
- Reasoning** (SEE Logic, Thinking, Cognition, Categorical Behavior)
- Recall** (see also Memory, Recognition, Retention)
6119, 6134, 6135, 6137, 6139, 6140, 6141, 6143, 6144, 6145, 6152, 6495, 6496, 6500, 6507, 6633, 6636, 7461, 7479, 7523, 7837
- Recognition** (see also Memory, Recall, Retention)
6017, 6023, 6024, 6151, 6166, 6517, 7265, 7501, 7738
- Recreation**
6354, 6619, 7148, 7180, 7220, 7238, 7503, 7600, 7922
- Redundancy** (SEE Information Theory)
- Reflex** (see also Conditioned Response, Response, Muscle)
6220, 6368, 7268
- Regression** (SEE Personality, Behavior Problems, Statistics)
- Rehabilitation** (see also Counseling, Rehabilitation/Vocational, Education/Special-Remedial)
6936, 6948, 7093, 7238, 7239, 7240, 7242, 7250, 7282, 7294, 7353, 7359, 7374, 7480, 7578
- Rehabilitation/Vocational** (see also Mental Retardation/Vocational Rehabilitation & Training in)
7062, 7098, 7237, 7282
- Reinforcement** (see also next headings, Rat/Reinforcement & Reinforcement Schedule in)
6066, 6094, 6102, 6130, 6192, 6198, 6236, 6405, 6417, 6428, 6429, 6431, 6434, 6450, 6456, 6487, 6756, 7091, 7219, 7346, 7351, 7353, 7407, 7439, 7530, 7568, 7797, 7824, 7826, 7839, 7876, 7920
- Reinforcement Schedule**
6098, 6111, 6118, 6128, 6129, 6210, 6305, 6343, 6400, 6401, 6409, 6416, 6426, 6428, 6436, 6439, 6440, 6443, 6450, 6452, 6487, 6491, 6767, 7004, 7101, 7193, 7346, 7717
- Reinforcement Theory**
6425, 6429, 7576
- Reinforcement/Delayed** (SEE Reinforcement Schedule)
- Reinforcement/Partial** (SEE Reinforcement Schedule)
- Reinforcement/Secondary** (SEE Reinforcement Schedule)
- Reinforcement/Social**
6059, 6110, 6128, 6493, 6579, 6587, 6795, 7101, 7351, 7370, 7409, 7439, 7515, 7557, 7591, 7642, 7797
- Relaxation** (SEE Behavior Therapy, Muscle)
- Reliability**
5972, 5983, 6035, 6087, 6877, 6892, 7458
- Religion**
5955, 6529, 6555, 6629, 6653, 6658, 6664, 6665, 6666, 6667, 6668, 6684, 6685, 6688, 6691, 6709, 6711, 6756, 6791, 6828, 6836, 6931, 6947, 6960, 7055, 7100, 7136, 7315, 7337, 7411, 7433, 7594, 7595, 7753, 7763, 7784, 7792
- REM** (SEE Rapid Eye Movement)
- Reminiscence** (SEE Memory, Recall)
- Remission** (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization)
- Repetition** (SEE Stimulation, Familiarity)
- Replication** (SEE Contribution & Criticism)
- Repression**
6071, 6160, 6862, 6868, 6871, 7084, 7130, 7155, 7161
- Reptile** (SEE Animals)
- Research** (see also Experimentation)
5956, 6183, 6809, 6927, 7106, 7399, 7551, 7808, 7818
- Research Methods**
5964, 5976, 5997, 6176, 6642, 6797, 6841, 6918, 7033, 7383
- Reserpine** (SEE Tranquilizer)
- Residential Treatment** (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization, Institution & Institutionalization)
- Respiration**
6061, 6088, 6182, 6202, 6208, 6224, 6233, 6326, 6329, 6344, 6350, 6353, 6355, 6356, 6461
- Response** (see also Conditioned Response, Conditioned Emotional Response)
6092, 6102, 6401
- Response Latency** (SEE Reaction Time)
- Response Set** (SEE Set)
- Response/Delayed** (SEE Response)
- Retardate** (SEE Mental Retardation)
- Retention** (see also Memory, Recall, Recognition)
6100, 6116, 6132, 6145, 6148, 6217, 6393, 6489, 6494, 6512, 6731, 6776, 6929, 7685, 7687, 7696, 7703, 7727, 7734, 7739, 7832, 7836
- Retina** (see also Eye)
6004, 6016, 6189, 6252, 6253, 6255
- Retirement** (SEE Adulthood, Occupation, Gerontology)
- Retrieval** (SEE Information)
- Reviews**
6182, 6269, 6306, 6811, 6916, 6926, 6942, 7026, 7033, 7214, 7320, 7366
- Reward** (see also Reinforcement)
6059, 6411, 6430, 6433, 6763, 7275, 7345, 7718
- Rigidity** (SEE Personality Trait, Authoritarianism)
- Riot** (SEE Social Behavior/Human, Aggression, Social Movements)
- Risk Taking**
6173, 6672, 6743, 6766, 6773, 6874, 7453, 7698, 7918
- Risky Shift Phenomenon** (SEE Group Dynamics, Risk Taking)
- RNA** (SEE Biochemistry)
- Role**
6573, 6592, 6634, 6659, 6676, 6678, 6762, 6797, 7047, 7175, 7529, 7564, 7603, 7637, 7640, 7645
- Role Playing** (SEE Role)
- Rorschach Test** (see also Projective Technique)
6619, 6890, 6907, 6908, 6909, 6910, 6911, 6949, 6995, 7131, 7177, 7371, 7527
- Rosenzweig Picture Frustration Study** (SEE Projective Technique)
- Rotary Pursuit** (SEE Visual Perception, Motor Performance)
- Rotation** (SEE Somesthesia, Factor Analysis)
- Running** (SEE Activity, Motor Performance)
- Rural Environment** (see also Community, Urban & Suburban Environment)
6488, 6547, 6597, 6605, 6616, 6661, 6682, 6891, 6913, 6947, 7100, 7123, 7377, 7544, 7601, 7624, 7762
- Russia** (SEE USSR)
- Sadism** (SEE Sexual Deviation)
- Safety** (see also Driving)
7921, 7922, 7923
- Salary** (SEE Money, Socioeconomic Status)
- Salivation** (SEE Conditioning/Classical, Gland, Taste)
- Salt** (SEE Biochemistry, Food)
- Satiation** (SEE Motivation)
- Scale** (see also Attitude Measurement, Inventory, Rating Scale, Testing Methods)
6516, 6532, 6559, 6886, 6998, 7051, 7258, 7450, 7451, 7882
- Scaling** (see also Measurement)
5989, 6039, 6816
- Scanning** (SEE Detection)
- Schizophrenia** (see also next headings)
6915, 7032, 7157, 7167, 7191, 7192, 7194, 7198, 7199, 7200, 7207, 7213, 7214, 7216, 7248, 7367
- Schizophrenia/Childhood**
7171, 7203, 7205, 7206, 7208, 7215, 7219
- Schizophrenia/Chronic**
7016, 7196, 7197, 7201, 7204, 7211, 7221
- Schizophrenia/Diagnosis of**
7073, 7210
- Schizophrenia/Family Role in**
6926, 7206, 7208
- Schizophrenia/Learning & Cognition in**
7167, 7191, 7193, 7197, 7201, 7202, 7203, 7211, 7212, 7214, 7217, 7218
- Schizophrenia/Physiology of**
7032, 7190, 7215
- Schizophrenia/Symptomatology of**
7194, 7195, 7202, 7207, 7209, 7210, 7214
- Schizophrenia/Treatment of** (see also Drug Therapy-Schizophrenia)
7209, 7220
- Scholastic Achievement** (SEE Achievement Academic)
- School** (see also next headings, Achievement Classroom, College, Education)
7013, 7389, 7394, 7415, 7427, 7549, 7559, 7595, 7648, 7782
- School Achievement** (SEE Achievement/Academic)
- School Adjustment**
6653, 6828, 7401, 7403, 7405, 7407, 7408, 7409, 7418, 7421, 7422, 7433, 7435, 7528, 7532, 7556, 7560, 7570, 7571, 7574, 7580, 7720, 7752, 7754, 7759, 7772, 7797, 7803
- School Administration**
7248, 7389, 7413, 7417, 7549, 7559, 7600, 7601, 7602, 7603, 7605, 7606, 7607, 7608, 7609, 7903
- School Anxiety** (SEE Anxiety, Test Anxiety)
- School Dropout**
7714, 7752
- School Learning** (see also Achievement/Academic)
6074, 7396, 7423, 7471, 7472, 7479, 7672, 7676, 7677, 7680, 7682, 7683, 7684, 7685, 7687, 7688, 7690, 7695, 7696, 7698, 7703, 7722, 7726, 7727, 7734, 7735, 7739, 7740, 7748, 7781, 7791, 7810, 7819, 7820, 7837, 7838, 7847
- School Psychology** (SEE Educational Psychology, Guidance/Educational)
- School Subjects** (SEE Curriculum, Mathematics, Reading)
- Science & Scientists**
5953, 5957, 5963, 7884, 7914
- Scientific Method** (SEE Method & Methodology)
- Score & Scoring**
6086, 6532, 6565, 6902, 6908, 7448, 7453, 7832
- Seasonal Changes** (SEE Time, Temperature, Environment)
- Security** (SEE Dependency)
- Sedative** (SEE Drugs)
- Segregation** (SEE Integration)
- Seizure** (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
- Selection**
6942, 6949, 7631, 7724, 7861, 7862, 7863, 7864, 7865, 7866, 7867, 7868, 7887, 7913
- Self** (see also next headings)
5947, 6725, 6737, 7138, 7216, 7538, 7581, 7681, 7870
- Self-Actualization** (SEE Self)
- Self Concept**
6005, 6453, 6547, 6554, 6561, 6562, 6585, 6592, 6605, 6717, 6751, 6828, 6843, 6872, 7088, 7148, 7163, 7358, 7359, 7373, 7416,

BRIEF SUBJECT INDEX

7419, 7421, 7425, 7435, 7473, 7512, 7528, 7535, 7540, 7541, 7560, 7562, 7564, 7565, 7577, 7587, 7625, 7653, 7656, 7668, 7686, 7704, 7707, 7713, 7725, 7731, 7732, 7737, 7749, 7755, 7786, 7788, 7803, 7805, 7844

Self-Disclosure (SEE Interpersonal Processes)

Self-Esteem (SEE Self-Concept)

Self-Evaluation
6585, 6662, 6777, 6848, 6872

Self-Perception
6063, 6562, 6568, 6608, 6660, 6673, 6704, 6750, 6770, 6847, 6870, 6951, 7115, 7144, 7255, 7260, 7403, 7546, 7586, 7588, 7590, 7621, 7638, 7643, 7645, 7653, 7757, 7903

Self-Stimulation (see also Motivation, Stimulation, Brain Stimulation, Rat/Brain Stimulation in)
6223, 6327

Self/Ideal (SEE Self-Concept)

Selling (SEE Advertising, Business, Consumer Behavior)

Semantic Differential
6801, 6810, 6816, 6909

Semantics (see also Meaning, Meaningfulness)
6112, 6157, 6507, 6527, 6811, 6818, 6858, 7277

Senility (SEE Geriatrics)

Sensitivity
6080, 6258, 6631, 6732, 6741, 6751, 6755, 6770, 6775, 6850, 6897, 7130, 7546, 7565, 7650, 7652, 7659, 7666, 7869, 7870, 7872, 7873

Sensory Adaptation (SEE Adaptation/Sensory)

Sensory Deprivation (SEE Deprivation/Sensory)

Sensory Physiology (SEE Physiology/Sensory)

Sensory Processes (see also Intersensory Processes, Physiology/Sensory)
6142, 6181, 6225, 6463, 7196, 7299, 7923

Sentence
6157, 6512, 6517

Sentence Completion Test (SEE Projective Technique)

Serial Learning (SEE Learning/Serial)

Set (see also Expectation)
6136, 6414, 6517, 6794, 6822, 7202, 7348

Sex
6688, 6862, 7732, 7767

Sex Differences
5988, 6005, 6025, 6040, 6061, 6064, 6096, 6245, 6477, 6479, 6490, 6516, 6530, 6546, 6553, 6559, 6561, 6569, 6578, 6579, 6595, 6598, 6605, 6612, 6623, 6637, 6663, 6687, 6688, 6689, 6691, 6694, 6702, 6707, 6719, 6729, 6743, 6744, 6753, 6765, 6780, 6792, 6793, 6804, 6806, 6840, 6842, 6855, 6883, 6898, 6946, 6987, 7108, 7115, 7182, 7261, 7330, 7354, 7372, 7408, 7415, 7424, 7426, 7434, 7439, 7513, 7544, 7565, 7595, 7641, 7646, 7651, 7679, 7712, 7714, 7743, 7748, 7786

Sex Differences-Animal
6186, 6392, 6459

Sex Differences/Academic Achievement
7672, 7752, 7843

Sex Role
6361, 6363, 6558, 6567, 6577, 6660, 6663, 6844, 6911, 7102, 7139, 7147, 7149, 7174, 7178, 7260, 7573, 7732, 7798, 7857

Sexual Behavior
6043, 6068, 6182, 6351, 6607, 6677, 6683, 6684, 6685, 6686, 6687, 6690, 6691, 6692, 6693, 6694, 6707, 6945, 7065, 7128, 7157

Sexual Behavior-Animal
6274, 6360, 6373, 6374, 6451, 6689

Sexual Deviation (see also Homosexuality)
6855, 6898, 6924, 7124, 7209

Sexual Disorder
7128, 7236, 7255

Shape Perception (SEE Perception/Form & Shape)

Shaping (SEE Conditioning)

Sheltered Employment (SEE Rehabilitation/Vocational)

Shock & Shock Intensity (see also Electroconvulsive Shock, Brain Stimulation, Rat/

Brain Stimulation in, Rat/Shock & Shock Effects in)
6065, 6109, 6129, 6253, 6266, 6302, 6386, 6450

Shock Therapy (SEE Electroconvulsive Shock Therapy)

Shock/Electroconvulsive (SEE Electroconvulsive Shock)

Sibling (SEE Family Relations)

Signal
6029, 6031, 6033, 6035, 6037, 6083, 6091, 6106, 6458, 6791

Similarity
5989, 6060, 6121, 6122, 6572, 6580, 6581, 6676, 6739, 6795, 6821, 7385, 7555, 7696, 7913

Simulation (see also Model)
6000, 6109, 6726, 7604

Size Constancy (SEE Gestalt Psychology, Visual Perception, Perception)

Size Perception (SEE Perception/Size)

Skin (see also Cutaneous Sense)
6062, 6072, 6229, 6740, 7129, 7155, 7215, 7222

Skin Resistance (SEE Skin, Galvanic Skin Response)

Sleep (see also Dream & Dreaming, Rapid Eye Movement)
6043, 6045, 6145, 6201, 6230, 6241, 6251, 6276, 6279, 6308, 6328, 6922, 6985, 7032, 7187

Slow Learners (SEE Learning Disorders, Mental Retardation)

Smell
6195, 6367, 6460

Smoking
6278

Social Processes (see also next headings, Interpersonal Processes)
6630, 6641, 6645, 6659, 6663, 6666, 6971, 7145

Social Acceptance (SEE Acceptance, Social Approval)

Social Adjustment (SEE Adjustment/Personal & Social)

Social Approval (see also Acceptance)
6110, 6581, 6673, 6774, 6785, 6800, 6845, 6903, 6975, 7252, 7403, 7439, 7519, 7686, 7726, 7741, 7785

Social Attraction (SEE Interpersonal Attraction)

Social Behavior/Animal
6179, 6359, 6369, 6371, 6373, 6375, 6376, 6385, 6451, 6452, 6453, 6454, 6455, 6456, 6457, 6458, 6459

Social Behavior/Human (see also Childhood/Social Behavior in)
6346, 6359, 6371, 6642, 6742, 6752, 6756, 6765, 7150

Social Casework
6932, 7256, 7257

Social Change
6479, 6648, 6682, 6683, 6712, 6914, 7111, 7420, 7608, 7851

Social Class (SEE Social Structure, Socioeconomic Status)

Social Deprivation (SEE Childhood Disadvantaged Socioeconomic Status)

Social Desirability (SEE Acceptance, Social Approval)

Social Distance (SEE Isolation, Social Approval)

Social Influence (see also Interpersonal Influence)
5978, 6624, 6661, 6712, 6721, 6722, 6728, 6759, 6766, 6770, 6771, 6787, 6784, 6833, 6874, 7107, 7621, 7883, 7902

Social Interaction
6359, 6578, 6630, 6726, 6736, 6748, 6768, 6769, 6782, 6950, 6989, 7173, 7198, 7249, 7406, 7417, 7596, 7653, 7793

Social Isolation (SEE Alienation, Isolation)

Social Mobility (see also Social Structure)

Social Model (SEE Social Processes, Social Structure)

Social Movements
7412, 7420

Social Perception
5984, 6066, 6073, 6515, 6555, 6561, 6563, 6568, 6572, 6580, 6581, 6586, 6595, 6596, 6601, 6608, 6643, 6660, 6669, 6673, 6679, 6696, 6698, 6699, 6704, 6727, 6730, 6739, 6756, 6765, 6770, 6777, 6781, 6784, 6785, 6786, 6787, 6792, 6793, 6794, 6796, 6797, 6798, 6799, 6800, 6801, 6802, 6803, 6806, 6833, 6843, 6861, 6896, 6897, 6906, 6931, 6946, 7051, 7063, 7191, 7198, 7249, 7251, 7260, 7413, 7415, 7417, 7558, 7578, 7587, 7597, 7601, 7602, 7621, 7625, 7630, 7652, 7653, 7654, 7659, 7663, 7668, 7713, 7757, 7758, 7862, 7897, 7902, 7907

Social Power (SEE Social Influence, Interpersonal Influence, Social Movement)

Social Psychiatry (SEE Psychiatry, Social Processes)

Social Psychology
6638, 6642, 6643

Social Reinforcement (SEE Reinforcement, Social)

Social Role (SEE Role)

Social Science
6359

Social Structure (see also Socioeconomic Status)
6659, 6662, 6682, 6735, 6744, 7063, 7174, 7851

Social Welfare (SEE Social Casework)

Socialization
6502, 6555, 6563, 6573, 6601, 6629, 6850, 6896, 7142, 7661

Society (SEE Culture)

Socioeconomic Status (see also Social Structure)
6478, 6480, 6495, 6497, 6504, 6514, 6525, 6531, 6537, 6539, 6542, 6548, 6550, 6551, 6558, 6568, 6594, 6597, 6602, 6604, 6605, 6610, 6628, 6630, 6637, 6643, 6644, 6647, 6687, 6688, 6691, 6695, 6923, 6943, 6957, 7099, 7109, 7111, 7122, 7140, 7148, 7184, 7223, 7378, 7400, 7406, 7415, 7421, 7425, 7439, 7446, 7527, 7544, 7555, 7573, 7596, 7630, 7673, 7677, 7686, 7693, 7718, 7725, 7730, 7743, 7760, 7782, 7813, 7848

Sociology
6180, 6159, 7377, 7402

Sociometric Status (SEE Social Approval)

Sociometry (SEE Social Approval)

Sociopathy (SEE Behavior Pathology, Crime & Criminals, Antisocial Behavior)

Sodium Chloride (SEE Food Biochemistry)

Soldier (SEE Personnel Military)

Somesthesia (see also Kinesthesia, Cutaneous Sense)
6041, 6042, 6225, 6231, 6254, 6282, 7340, 7361, 7492

Sorting (SEE Categorical Behavior)

Sound (see also Audition, Noise)
6022, 6031, 6036, 6148, 6266, 6263, 6466, 7279

Space Flight (SEE Aviation, Environment, Simulation)

Space Orientation (SEE Orientation)

Space Perception (SEE Perception/Space)

Special Education (SEE Education, Special)

Speech (see also next headings, Verbal Behavior)
6484, 6502, 6508, 6813, 6815, 6818, 6975, 7004, 7197, 7265, 7272, 7276, 7279, 7354, 7469, 7484, 7620, 7823, 7837

Speech Perception
6032, 6033, 6470, 6508, 6631, 7168

Speech Therapy
7278, 7279, 7278, 7282

Speech Defective (see also Speech Therapy, Stuttering)
7193, 7230, 7271, 7272, 7274, 7276, 7277, 7279, 7280, 7281, 7282, 7291

Speed (SEE Movement)

Spiral Aftereffect (SEE Aftereffect)

Sports (SEE Recreation, Education Physical)

Stammering (SEE Stuttering)

Stanford-Binet Intelligence Scale (SEE Test Intelligence)

Startle (SEE Response)

- Statistics** (see also *Mathematics, Factor Analysis*)

GENERAL

OBITUARIES

7924. Court, J. H. John C. Raven, M.Sc., F.B.Ps.S. (1902-1970). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 47-48.—Briefly recounts the life of J. C. Raven known for his contribution to psychological theory and practice.—V. S. Sexton.

7925. Lee, D. M. Charlotte M. Fleming, M.A., Ed.B., Ph.D. (1894-1970). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 45-46.—Briefly recounts the life of C. M. Fleming and her contribution to furthering "psychological knowledge and its relations with the practice of education in all its aspects."—V. S. Sexton.

7926. White, John G. Mahesh M. Desai, M.A., B.Comm., LL.B., Ph.D., F.B.Ps.S. (1903-1970). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 45.—In this obituary, the contribution of M. M. Desai to establishing a place for clinical psychologists in England's health services is briefly recounted.—V. S. Sexton.

7927. Woodhead, Barbara. Emanuel Miller, M.A., F.R.C.P., D.P.M., F.B.Ps.S. (1893-1970). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 47.—Briefly recounts the life of E. Miller known for his work in, and contributions to, child psychiatry.—V. S. Sexton.

7928. Wright, H. J. Charles Jackson, M.A., Ph.D., Dip.Ed., F.B.Ps.S. (1908-1969). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 46-47.—Briefly recounts the life of C. Jackson who is known for his work in pioneering postwar educational psychology.—V. S. Sexton.

HISTORY

7929. Brown, L. B. & Fuchs, Alfred H. (Victoria U., Wellington, New Zealand) Early experimental psychology in New Zealand: The Hunter-Titchener letters. *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 10-22.—Experimental psychology in New Zealand had an early start (1904) but only slowly separated from philosophy. In so doing, both the attitudes of philosophers and the nonexperimental traditions then prevailing in Great Britain had to be overcome—especially difficult since New Zealand ex-aminations were then set and marked in Great Britain. Titchener staunchly encouraged Hunter's pioneering efforts to work towards "experimental psychology" as a separate discipline, thus, contributing to the world spread of experimental psychology as well as simply bringing Wundtian psychology to North America.—C. M. Franks.

7930. Flugel, J. C. & West, Donald J. A hundred years of psychology. New York, N.Y.: International Universities Press, 1970. 394 p. \$12.

7931. Joynson, R. B. (U. Nottingham, England) The breakdown of modern psychology. *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 261-269.—The author's examination of the "generally accepted doctrine" of objective experiment leads him to agree with J. J. Gibson's contention that scientific psychology is ill-founded and its gains puny. Attempts to restrict inquiry to the study of external stimulation alone are shown to have repeatedly failed as have attempts to include internal conditions by indirect methods. The history of modern psychology is described as a record, not of scientific advance, but of intellectual retreat.—V. S. Sexton.

7932. Juhasz, Joseph B. (Bennington Coll.) Greek theories of imagination. *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 39-58. The historical antecedents of our present conception of what is a "mental image" are traced back to its Greek origin. The history of the concept of imagining, of the concept of image, is inextricably intertwined with the history of the theory of knowledge. The Greek's preoccupation with the means whereby knowledge is obtained led them to the concept of "imagining" and a tying together by Aristotle of seemingly diverse phenomena under 1 rubric. The swing away from empirical, objective knowing during the Middle Ages prepared the ground for the late resurgence of the visual and other metaphors for the process of imaginal knowing in the age of science and reason—and for their unquestioned acceptance as the truth (as "the way things are") by today's man in the streets. In paying attention to the "participant" senses, to the total and undivided involvement of the haptic world, we are moving away from a dualistic and aseptic approach to nature and to ourselves.—C. M. Franks.

PHILOSOPHY

7933. Dubinin, N. P. (Inst. of General Genetics, Moscow, USSR) *Filosofskie i sotsiologicheskie aspekty genetiki cheloveka*. [Philosophical and sociological aspects of human genetics.] *Voprosy Filosofii*, 1971(Jan), Vol. 25(1), 36-45.—Owing to man's consciousness, there is a program of social inheritance as well as one of biological inheritance. The rapidity of the former compensates for the slowness of the latter. Modern genetics does not support views postulating the biological degeneration of man. Criticism is leveled at opinions according to which the genetic nature of mankind requires major alteration if it is to escape destruction due to biological factors. In order to intervene into the heredity of man without spiling its unique character, it is first necessary to gain a deep understanding of his genetics, and the relationship between his genetic and social programs. (English summary)—I. D. London.

7934. Gvishiani, D. M., Mikulinskii, S. R., & Yaroshevskii, M. G. (State Committee on Science &

(1903-1970). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 45.—In this obituary, the contribution of M. M. Desai to establishing a place for clinical psychologists in England's health services is briefly recounted.—V. S. Sexton.

7927. Woodhead, Barbara. Emanuel Miller, M.A., F.R.C.P., D.P.M., F.B.Ps.S. (1893-1970). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 47.—Briefly recounts the life of E. Miller known for his work in, and contributions to, child psychiatry.—V. S. Sexton.

7928. Wright, H. J. Charles Jackson, M.A., Ph.D., Dip.Ed., F.B.Ps.S. (1908-1969). *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 46-47.—Briefly recounts the life of C. Jackson who is known for his work in pioneering postwar educational psychology.—V. S. Sexton.

HISTORY

7929. Brown, L. B. & Fuchs, Alfred H. (Victoria U., Wellington, New Zealand) Early experimental psychology in New Zealand: The Hunter-Titchener letters. *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 10-22.—Experimental psychology in New Zealand had an early start (1904) but only slowly separated from philosophy. In so doing, both the attitudes of philosophers and the nonexperimental tradition then prevailing in Great Britain had to be overcome—especially difficult since New Zealand examinations were then set and marked in Great Britain. Titchener staunchly encouraged Hunter's pioneering efforts to work towards "experimental psychology" as a separate discipline, thus, contributing to the world spread of experimental psychology as well as simply bringing Wundtian psychology to North America.—C. M. Franks.

7930. Flugel, J. C. & West, Donald J. A hundred years of psychology. New York, N.Y.: International Universities Press, 1970. 394 p. \$12.

7931. Joynson, R. B. (U. Nottingham, England) The breakdown of modern psychology. *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 261-269.—The author's examination of the "generally accepted doctrine" of objective experiment leads him to agree with J. J. Gibson's contention that scientific psychology is ill-founded and its gains puny. Attempts to restrict inquiry to the study of external stimulation alone are shown to have repeatedly failed as have attempts to include internal conditions by indirect methods. The history of modern psychology is described as a record, not of scientific advance, but of intellectual retreat.—V. S. Sexton.

7932. Juhasz, Joseph B. (Bennington Coll.) Greek theories of imagination. *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 39-58.—The historical antecedents of our present conception of what is a "mental image" are traced back to its Greek origin. The history of the concept of imagining, of the concept of image, is inextricably intertwined with the history of the theory of knowledge. The Greek's preoccupation with the means whereby knowledge is obtained led them to the concept of "imagining" and a tying together by Aristotle of seemingly diverse phenomena under 1 rubric. The swing away from empirical, objective knowing during the Middle Ages prepared the ground for the late resurgence of the visual and other metaphors for the process of imaginal knowing in the age of science and reason—and for their unquestioned acceptance as the truth (as "the way things are") by today's man in the streets. In paying attention to the "participant" senses, the total and undivided involvement of the haptic world, we are moving away from a dualistic and aseptic approach to nature and to ourselves.—C. M. Franks.

PHILOSOPHY

7933. Dubinin, N. P. (Inst. of General Genetics, Moscow, USSR) *Filosofskie i sotsiologicheskie aspekty genetiki cheloveka*. [Philosophical and sociological aspects of human genetics.] *Voprosy Filosofii*, 1971(Jan), Vol. 25(1), 36-45.—Owing to man's consciousness, there is a program of social inheritance as well as one of biological inheritance. The rapidity of the former compensates for the slowness of the latter. Modern genetics does not support views postulating the biological degeneration of man. Criticism is leveled at opinions according to which the genetic nature of mankind requires major alteration if it is to escape destruction due to biological factors. In order to intervene into the heredity of man without spoiling its unique character, it is first necessary to gain a deep understanding of his genetics, and the relationship between his genetic and social programs. (English summary)—J. D. London.

7934. Gvishiani, D. M., Mikulinskii, S. R., & Yaroshevskii, M. G. (State Committee on Science &

Technology, Moscow, USSR) **Sotsial'nye i psikhologicheskie aspekty izucheniya deyatel'nosti uchénogo.** [Social and psychological aspects in the study of the activity of the scientist.] *Voprosy Filosofii*, 1971(Mar), Vol. 25(3), 83-92.—Discusses modern science as a special form of activity with its own particular social and psychological aspects. Structural changes in the organization of scientific endeavor make imperative the clarification of the ways in which organizational forms influence the intellectual activity and motivation of the scientist. Meanwhile, the fact that the organization of scientific activity may not keep up with changes in its character presents a continual difficulty. However, it does not follow from this that the organization of scientific endeavor is in itself incompatible with freedom of research or destructive of scientific creativity. The rational organization of scientific endeavor, by taking into account the special character of scientific work and the properties of interpersonal relationships, aims to create an intellectual climate that is conducive to the realization of the creative potential of individual researchers. (English summary)—*J. D. London*

7935. Jones, Hardy E. (U. Wisconsin) **Kant's principle of personality.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6112

7936. Osipenko, I. **O kul'ture umstvennogo truda.** [On the cultivation of mental work.] *Dushkal'nye Voprasy*, 1970(Dec), Vol. 43(12), 64-68.—Discusses Lenin's prescriptions for cultivating useful habits for mental work in general. *J. D. London*

7937. Przelencky, M. (Warsaw U., Poland) **O znachenii teorii modelei v logike émpiricheskoi nauki.** [On the significance of the theory of models in the logic of empirical science.] *Voprosy Filosofii*, 1971(Mar), Vol. 25(3), 127-135.—Discusses the applicability of the theory of models in the logical analysis of empirical theories. Its use for the study of the semantics of empirical languages is seen as opening up new possibilities, as illustrated by the procedures of widening the language of empirical theory through the addition of new terms. Major attention is directed to the problem of interpretation of the language under examination. (English summary) *J. D. London*

7938. Rybak, David. **Existential behaviorism: A transactionalistic approach to self-determination.** *Canadian Psychologist*, 1971(Apr), Vol. 12(2), 243-247.—Describes existential behaviorism as a transactionalistic approach to the free will-determinism controversy in psychology. This relativistic view gives equal importance to both schools, advocating that self-determination involves the free choice of shaping one's own destiny using, perhaps, a knowledge of cause and effect principles of behavior. (French abstract)—*Journal abstract*

7939. Sevast'yanov, V. I. & Ursul, A. D. (Inst. of Philosophy, Moscow, USSR) **Kosmicheskaya éra: Novye vzaimootnosheniya obshchestva i prirody.** [The cosmic era: New interrelationships between society and nature.] *Voprosy Filosofii*, 1971(Mar), Vol. 25(3), 107-116.—Discusses the consequences of man's penetration into space evoking a call for new attitudes in order to "place the achievements of space exploration at the service of mankind." (English summary)—*J. D. London*

7940. Smirnov, G. L. **K voprosu o kontseptsii sotsialisticheskogo tipa lichnosti.** [On the conception of man as a socialist type.] *Voprosy Filosofii*, 1971(Jan), Vol. 25(1), 26-35.—Describes the general social and

personality characteristics of the man who may be termed socialist in type as distinguished from other types historically known. This man assimilates, in the form of "character traits," the basic characteristics of the new social environment along with the values of a socialist ideology. The latter organically include a new attitude toward work and other people since this new type of man reflects the real properties of a new social environment. However, the general socialist type includes subtypes that reflect the social heterogeneity of the past which lingers on. Social heterogeneity in a socialist society need not be an obstacle but may be viewed as a condition for the development of diversity. (English summary)—*J. D. London*

7941. Iugarinov, V. P. **Filosofiya soznaniya.** [Philosophy of consciousness.] USSR: Mysl', 1971. 72 K.—Presents a philosophical study of consciousness based on generalizations achieved in modern neurophysiology, general and social psychology, cybernetics, bionics, and semiotics. Consciousness was analyzed in its ontological and social aspects. Significance of the information concept in cybernetics, the problem of signs and symbols, machine thinking, and the problems of social psychology are discussed.—*J. Haley*

PARAPSYCHOLOGY

7942. ———. **Autumn review meeting of the Institute for Parapsychology, FRNM.** *Journal of Parapsychology*, 1970(Dec), Vol. 34(4), 271-284.—Presents summaries of 19 reports which were read at the Foundation for Research on the Nature of Man in September 1970.

7943. FitzHerbert, Joan. **The nature of hypnosis and paranormal healing.** *Journal of the Society for Psychical Research*, 1971(Mar), Vol. 46(747), 1-15

Integrating an explanation of the phenomena described in works by W. Sargant, S. Black, and N. Miller, hypnosis is described as somewhat analogous to fetal life—the trance as regression to an infantile state, and the hypnotist as a mother figure. The hypothesis suggesting intimate mother-child communication prior to 2 yr. of age, which may be confused for ESP communication with God, is cited. In a deep trance, ESP abilities, freed from repression, increase in telekinetic power. The interaction of telekinetic mental energy with another mental energy field may affect all matter. Therefore, visualizing physical healing by suggestion in deep hypnotic trances becomes the resultant produced by telekinetic activity. Similar mechanisms are described for autonomic learning and divine healing. (18 ref.)—*G. J. Frankel*

7944. Schmidt, Helmut. (Inst. for Parapsychology, Durham, N.C.) **PK experiments with animals as subjects.** *Journal of Parapsychology*, 1970(Dec), Vol. 34(4), 255-261.—Attempted in 2 experiments to use pleasant or unpleasant stimuli to activate the possible psychokinesis ability of animals and lower forms of life. The basic apparatus was a binary random number generator (RNG). In some exploratory tests with a cat, the RNG was connected to a heat lamp placed with the S in a cold room. A total of 9,000 numbers generated resulted in 4,615 occasions on which the lamp turned on and provided the S with heat. In Exp. II cockroaches served as Ss. Ss were placed on a shocking grid, also connected with the binary RNG, in order to see if the Ss could influence the apparatus so as to avoid the electric shock. It was found that they received more, not less.

than the expected number. A confirmatory test showed the same direction of scoring: a total of 25,600 numbers generated by the RNG resulted in 13,109 shocks, a deviation of 309 more than expected by chance. It is suggested that the random generator did not produce the numbers as physics would predict, but the generated numbers depended on the later effect they caused.
—*Journal abstract.*

7945. **Thouless, Robert H.** Experiments on psi self-training with Dr. Schmidt's pre-cognitive apparatus. *Journal of the Society for Psychical Research*, 1971(Mar), Vol. 46(747), 15-21.—Utilizing H. Schmidt's (see PA, Vol. 44:4322) electronic apparatus for pre-cognitive experimentation, in which the S has to decide which of 4 colored lights will be in circuit when he presses a key, the E tested himself (8 batches of 100 trials) daily for 3 wk. The 1st batches aimed at success in pressing down the correct key, while aiming for failure in the next batch, hoping to achieve a differential effect from the 2 conditions. The E reported statistically insignificant results of attempts to find evidence of learning. Although the experiment appears to be a failure in finding a psi task learning device, because some suggestion of a learning effect did occur, further experimentation is encouraged.—*G. J. Frankel.*

THEORY & SYSTEMS

7946. **Burger, Henry G.** (U. Missouri, Kansas City) **Diachrony and arbitrage: Neglected factors in operant psychology.** *Current Anthropology*, 1971, Vol. 12, 171-178, 188-189.—The perhaps dominant school of psychology is operant behaviorism, made operational by Skinner's group as behavior modification. It is based on responses near in time and place to stimuli—appropriately, responses of pigeons, rats, and aphasics. But the normal human brain has a distinctive part (the angular gyrus) which enables cognition to bypass emotion, hence enabling symboling. Culture is the institutionization of symboling by interchanging past and future times, near and distant places. Navajo Indians avoid government gifts because of past experiences. Potlatches interequalize the irregularities (in time and space) of fish runs. Puberty rites create obligations that overcome tropical protein deficiencies. Such spatio-temporal spreadings are environmental realities that hardly fit the rigid laboratory. Such interlinkages require field work. Operant-boasted successes disappear when one pursues them beyond their artificial environment, especially into a non-Anglo environment. 5 field situations are cited. (16 ref.)
—*Journal summary.*

7947. **Gibson, James J.** (Cornell U.) **The legacies of Koffka's principles.** *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 3-9.—Among the founding fathers of Gestalt psychology, Koffka is the only one to have written a book of principles. But the laws of vision that he proposed, apart from the facts that he established, have not been verified over the years; e.g., the phenomenon of figure-on-ground is not universal. The concept of structure remains ambiguous. And yet his book, more than any other of its time, set the psychology of perception on its present course.—*C. M. Franks.*

7948. **Hindeland, Michael J.** (U. California, Berkeley) **Edward Bradford Titchener: A pioneer in perception.** *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 23-28.—Titchener, born in England

but heavily indoctrinated with the German (Wundtian) tradition, stressed psychology as the science of "mind" or "consciousness," which 2 concepts he subtly distinguished. To study these phenomena, he turned to Asch-type introspection. Through introspection, 3 elements basic to perception were isolated—sensation, image, and affect. Sensation, the most important and the most basic element, was defined as any sense process that could not be further analyzed by introspection. In his 35 yr. of work in perception, Titchener published 10 books and over 200 articles—many devoted to the defense of introspection as a valid and reliable means of observation. While both introspection and much of the data he collected are highly suspect, Titchener is still to be viewed as very much responsible for making psychology scientific and experimental.—*C. M. Franks.*

7949. **Hudson, Liam.** (U. Edinburgh, Scotland) **The choice of Hercules.** *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 287-292.—Discusses the position of psychology between the polar extremes defined by the arts on the 1 hand and physical sciences on the other. The limitations of excessive empiricism are cited. The need to explore other alternatives—the structural, the phenomenological, and the anthropological—is recognized. It is felt that such exploration might even result in the kind of paradigm change which psychology now needs.—*V. S. Sexton.*

7950. **Radner, Michael & Winokur, Stephen.** (Eds.) (McMaster U., Hamilton, Ontario, Canada) **Minnesota studies in the philosophy of science: IV. Analyses of theories and methods of physics and psychology.** Minneapolis, Minn.: U. Minnesota Press, 1970. ix, 441 p. \$12.50.

7951. **Sjöberg, Lennart.** (U. Göteborg, Sweden) **The new functionalism.** *Scandinavian Journal of Psychology*, 1971, Vol. 12(1), 29-52.—Reviews the development of E. Brunswik's probabilistic functionalism. Brunswik's major contribution is considered to be his consistent emphasis on the importance of ecology. Brief reviews are presented of recent applications of probabilistic functionalism in perception, learning, and applied psychology. A mentalistic approach to psychology is considered as an alternative to functionalism. (3 p. ref.) *Journal abstract.*

7952. **Taylor, James G.** **Phantom theories: A reply to Mr. Vine.** *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 281-285.—Intended as a reply to I. Vine who attacked the present author's article on the role of axioms in psychological theory, this paper discusses theories that are unreal by reason of internal inconsistency but are not recognized as such. Such theories are termed phantom theories because they are incapable of performing the task for which a theory is designed, i.e., providing a tentative model that will serve to describe the operation of a real system in nature.—*V. S. Sexton.*

7953. **Westland, Gordon.** (U. Surrey, Guildford, England) **A note on the sub-philosophy of psychology.** *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 23-26. Proposes that the unwillingness among psychologists to think about what they do and say in analytical terms creates problems at a level below that of genuinely philosophical problems. It is contended that this sub- or prephilosophical level of confusion makes the real problems more obscure and difficult to grasp. It is argued that this level is the level of terminology. Difficulties caused by loose word usage cannot be ignored. (15 ref.)—*V. S. Sexton.*

EDUCATION & TRAINING

7954. Blumen, G. Une année de fonctionnement de la commission provisoire d'enseignement de la psychiatrie. [One year of functioning of the Provisional Commission on Psychiatric Education.] *Annales Médico-Psychologiques*, 1970(Dec) Vol. 253, 786. Reports on the actions of the French Provisional Regional Commission on Psychiatric Education, established in 1969. The 2nd part of the report deals with problems arising from the imposition of new educational forms for the teaching of psychiatry.—H. E. King.

PROFESSIONAL DEVELOPMENTS

7955. Cavers, David F. (Harvard U. Law School) The legal control of the clinical investigation of drugs: Some political, economic, and social questions. *Daedalus*, 1969(Spring) Vol. 98(2), 427-448. The multiplication of experiments incidental to the testing of drugs having similar powers, but with trivial differences related to questions of private rights over them complicates the application of general legal and professional principles. The duplications involved in the so-called "me too" drugs do not change the basic demands upon all who experiment with human Ss. The effort to establish effective governmental controls may in time produce a major shift in the responsibility for carrying out drug investigations.—R. F. Creegan.

7956. Curran, William J. (Harvard Medical School, Boston, Mass.) Governmental regulation of the use of human subjects in medical research: The approach of two federal agencies. *Daedalus*, 1969(Spring) Vol. 98(2), 542-594.—Prior to the passage of regulatory statutes there was a major effort to canvass opinion in the hospitals and research centers, and to determine the facts concerning current practice and self-regulation. The operation of administrative rules and of acts of Congress alike have been reviewed by additional questionnaires and symposia. 3 broad guidelines for regulation have received wide approval in almost all regulatory bodies: protection of the welfare of Ss, obtaining informed consent, and assessment of the risks and potential benefits of a specific investigation.—R. F. Creegan.

7957. Edsall, Geoffrey. (Massachusetts Dept. of Public Health, State Lab., Boston) A positive approach to the problem of human experimentation. *Daedalus*, 1969(Spring) Vol. 98(2), 463-479.—R. F. Creegan.

7958. Freund, Paul A. (Harvard U.) Introduction to the issue "Ethical aspects of experimentation with human subjects." *Daedalus*, 1969(Spring) Vol. 98(2), vii-xiv.—Since the 1950s funds for medical and related research have increased many times, and so has experimentation with human Ss. This issue of *Daedalus* offers some 15 statements on the ethical problems involved, and has articles by experts in some of the behavioral sciences as well as legal and medical specialists. Some articles discuss substantive issues, while others are concerned with procedures for arriving at ethical judgments and putting them into effect.—R. F. Creegan.

7959. Freund, Paul A. (Harvard U.) Legal frameworks for human experimentation. *Daedalus*, 1969(Spring) Vol. 98(2), 314-324. The legal frameworks relate not only to governmental regulation of practice, but to precedents in suits brought by patients or their families as a consequence of medical failures whether or

not caused by errors or illegal actions. Structural measures within a research community are in many cases more directly effective, but the ethical standards of the individual doctor will have the last word in some cases, and so education and factors affecting general views are involved. Cases are cited in the elaboration of these and secondary points.—R. F. Creegan.

7960. Jonas, Hans. (New School for Social Research) Philosophical reflections on experimenting with human subjects. *Daedalus*, 1969(Spring) Vol. 98(2), 219-247.—R. F. Creegan.

7961. Mead, Margaret. (American Museum of Natural History, New York, N.Y.) Research with human beings: A model derived from anthropological field practice. *Daedalus*, 1969(Spring) Vol. 98(2), 361-386.—The confidence of the public towards whole branches of science depends in large measure upon opinions concerning the ethical standards and consistency of practitioners. Society by sanctioning and supporting science implies a certain trust, and the scientist seeks to maintain that. The appropriate model for the human experimental S is the informed participant in science, and nothing could be more different than the human guinea pig. Difficulties in maintaining the ideal are severe in some urban hospital settings, no less than in some areas of anthropological field research. Reasons for trying to do so are pragmatic, as well as purely ethical, and are sufficiently convincing once the scientist understands them.—R. F. Creegan.

7962. Moore, Francis D. (Harvard Medical School, Boston, Mass.) Therapeutic innovation: Ethical boundaries in the initial clinical trials of new drugs and surgical procedures. *Daedalus*, 1969(Spring) Vol. 98(2), 802-822.—The 1st use of ether anesthesia, the 1st injection of insulin, and the 1st use of liver extract are a few examples among thousands that could be cited of potentially dangerous initial therapeutic trials. Risk exists in all such cases, and may be minimized but not eliminated by nontherapeutic experiments along related lines. There is need not only for some legal regulation but for professional guidelines sensitive to the risks and values of specific clinical areas. Whether consent of the S can be truly informed is still debated, and where no one knows all the risks no one is totally informed. There is danger that overregulation at the legal and professional levels will slow the progress of the health sciences, so 1 type of personal and social risk is balanced against other types.—R. F. Creegan.

7963. Parsons, Talcott. (Harvard U.) Research with human subjects and the "professional complex." *Daedalus*, 1969(Spring) Vol. 98(2), 325-360.—R. F. Creegan.

7964. Rurstein, David D. (Harvard Medical School, Boston, Mass.) The ethical design of human experiments. *Daedalus*, 1969(Spring) Vol. 98(2), 523-541.—R. F. Creegan.

INTERNATIONAL PSYCHOLOGY

GENERAL BOOKS & REFERENCE WORKS

7965. Gibbons, Don E. & Connelly, John F. (Eds.) (U. Portland) Selected readings in psychology. St. Louis, Mo.: C. V. Mosby, 1970. ix, 273 p. \$4.95 (paper).—Presents papers from psychological literature as a supplement to an introductory psychology textbook. Topics covered include biological foundations, learning, motivation, and developmental, abnormal, and applied psychology.

METHODOLOGY & RESEARCH TECHNOLOGY

7966. Brewer, Marilyn B., Campbell, Donald T., & Crano, William D. (Northwestern U.) **Testing a single-factor model as an alternative to the misuse of partial correlations in hypothesis-testing research.** *Sociometry*, 1970(Mar), Vol. 33(1), 1-11.—Criticizes the use of partial correlations to test hypotheses about the nature of relationships among psychological variables on the grounds that the model underlying such use of partialing does not allow for the effects of measurement error or unique factor components. It is suggested that the factor structure underlying the intercorrelations always be examined before the single-factor model is rejected in favor of a 2-factor model. Reanalyses of the data from several studies involving partial correlation are presented to illustrate this alternative procedure. (28 ref.)—*Journal abstract*.

7967. Droege, Robert C. (U.S. Dept. of Labor, Manpower Administration, Washington, D.C.) **Effectiveness of follow-up techniques in large-scale longitudinal research.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 27-31.—Recorded the success of techniques used to obtain follow-up occupational and educational information from Ss retested 2 and 7 yr. after being tested in Grade 12. Information was successfully obtained from 18,796 Ss at the 2-yr. follow-up and from 15,100 Ss at the 7-yr follow-up. Results show that (a) primary reliance should be placed on obtaining information by letters, because of their effectiveness and low cost; (b) a variety of secondary sources can be used if the information cannot be obtained from the S; (c) nearly 100% follow-up success is possible if detailed data are not required; and (d) a variety of techniques is required when detailed information must be obtained.—*Journal abstract*.

MODELS & MATHEMATICAL MODELS

MATHEMATICS & STATISTICS

7968. Afonja, Biyi. (U. Wisconsin) **Some Bayesian considerations of the analysis and choice of a class of designs.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5695-5696.

7969. Altin, Murray. (Macquarie U., North Ryde, New South Wales, Australia) **Statistical theory: Behavioral science application.** *Annual Review of Psychology*, 1971, Vol. 22, 225-250.—Presents a critical examination of developments in statistical theory, mainly between 1967 and 1968, which are relevant to behavior science. Important areas include (a) simultaneous inference, (b) multivariate analysis, and (c) nonparametric theory. (71 ref.)—*P. Herizberg*.

7970. Al'terman, A. Z., Rastrigin, L. A., & Solomonov, S. L. (Riga Polytechnical Inst., USSR) **Informatsionno-stolostnaya otsenka takika postanovki diagnoza (na primere razlicheniya dvukh nevrologicheskikh zabolevaniy).** [An assessment of the procedures undertaken to produce a diagnosis, taking into account the information and cost accruing (using discrimination between two neurological diseases by way of example).] *Kibernetika i Diagnostika*, 1969(Nov), No. 3, 171-185.—Proposes several algorithms for setting up procedures to produce a diagnosis, taking into account the information and cost-incurring characteristics of the

symptoms. Informational procedures are represented by 2 algorithms. "Situational entropy" is taken as the basis of the 1st algorithm; the minimum of the number of outcome vectors, as the basis of procedures the 2nd. Cost procedures consist of an examination of all possible variants of the diagnostic process and in the choice of the symptom which provides the least magnitude of mathematical expectation of subsequent losses going into determination of the diagnosis. The proposed procedures reduce to the choice of a symptom for which minimal loss accompanies isolated diminution of the set of outcomes.—*I. D. London*.

7971. Borisov, A. N. & Osis, Ya. Ya. (Riga Polytechnical Inst., USSR) **Polisk naibol'shei razdelnosti razmytykh mnozhestv.** [Search for the greatest divisibility of fuzzy sets.] *Kibernetika i Diagnostika*, 1969(Nov), No. 3, 79-88.—Examines the problem of the quantitative assessment of the informational character of diagnostic parameters, utilizing L. A. Zadeh's theory of "fuzzy sets." The method leads to optimizing the recognition of classes of technical states for a complex object of diagnosis. Mathematical procedures are developed and applied.—*I. D. London*.

7972. Hammond, Kenneth R., Householder, James E., & Castellan, N. John. (U. Colorado) **Introduction to the statistical method: Foundations and use in the behavioral sciences.** (2nd ed.) New York, N.Y.: Alfred A. Knopf, 1970. xxi, 410 p.

7973. Kutsin, G. I. & Rastrigin, L. A. (Riga Polytechnical Inst., USSR) **Issledovanie funktsii nevyazki pri identifikatsii prostranstvennykh form metodom minimizatsii.** [Study of the incongruity function in identification of spatial forms by the method of minimization.] *Kibernetika i Diagnostika*, 1969(Nov), No. 3, 97-105.—Presents the results of an investigation of the incongruity function applied to 2 images, represented in the form of n pairs of coordinates of specific points by the means of which these images are compared. The incongruity function should be minimal in case of identity of the latter. Mathematical procedures are developed and applied.—*I. D. London*.

7974. Markovich, Z. P. (Riga Polytechnical Inst., USSR) **Predvaritel'noe opredelenie diagnosticheskikh parametrov.** [Preliminary determination of diagnostic parameters.] *Kibernetika i Diagnostika*, 1969(Nov), No. 3, 19-32.—Proposes an algorithm for determining a set of diagnostic parameters, taking into account their informational weight and accessibility. The complex object of a technical diagnosis is replaced by its mathematical description in the form of graphs. A number of conditions are set up for the selection of the diagnostic parameters. The algorithm is illustrated by examples with appropriate graphic and numerical materials. *I. D. London*.

7975. McNeill, Keith A. & Spaner, Steven D. (Southern Illinois U.) **Highly correlated predictor variables in multiple regression models.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 117-125.—The inclusion in a multiple regression model of a predictor variable which is highly correlated with other predictor variables is usually not recommended. The argument is that the new predictor variable is accounting for variance which has already been accounted for in the model. A defense for the procedure of including highly correlated predictor variables under certain circumstances is presented. 1st, highly correlated variables can be used when there is a requirement that the predictor variables account for a certain number of group membership vectors. A 2nd and

more important situation occurs when there is theoretical or empirical justification for the inclusion of such a variable. Discussion is limited to a very specific kind of highly correlated variable one that contains the squared elements of 1 of the original variables. *Journal abstract.*

1976. Vul'f, G. N. & Osis, Ya. Ya. (Riga Polytechnical Inst., USSR) *Metody i sredstva raspoznavaniya obrazov i ikh prigodnost' dlya diagnostiki slozhnykh ob'ektov.* [Methods and means for recognition of images and their suitability for diagnosis of complex objects.] *Kibernetika i Diagnostika*, 1969(Nov), No. 3, 119-128. The problem of image recognition is shown to be equivalent to a certain mathematical problem involving an n -dimensional vector in a space of indices. Solutions are proposed and further problems suggested for exploration. Various questions are discussed concerning (a) organization of devices for image recognition, (b) classification, and (c) some possibilities for the application of points a and b for diagnostic purposes. (30 ref.).—*J. D. London.*

Factor Analysis

1977. Boon van Oostade, A. H. (Roman Catholic U., Nijmegen, Netherlands) *Over type-onderzoek.* [Concerning type-investigation.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Feb), Vol. 26(2), 82-101.—Discusses the applicability of type and/or trait investigations. A type is defined as a construct identified by a characteristic or combination of similar characteristics. A trait is defined as a characteristic or combination of characteristics that constitute a type. Type investigation is best accomplished by Q-analysis and trait investigation by R-analysis. The improper usage of either of these analyses has resulted in inconclusive results. Q-analysis is used most effectively in social-psychological research where insight is needed into the behavior of categories of persons. R-analysis is more important in the analysis of individual differences. Q-analysis is more adequate than R-analysis in the study of heterogeneous materials, such as conative and cognitive data. The iterative cluster analysis, if applied as Q-analysis, seems to be an adequate technique in identifying reliable and valid types. The representativeness of the types probably depends more on the reliability of data than on the analysis technique. (English summary) (45 ref.).—*A. J. Ter Keurst.*

1978. Levine, Ralph L. & Hunter, John E. (Michigan State U.) *Statistical and psychometric inference in principal components analysis. Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 105-116.—Statistical inference applied to principal components analysis deals with estimating the parameters of the correlation matrix, R , found in the population, from the characteristics of the sample matrix, R^* . Conversely, psychometric inference refers to estimating the internal consistency of the components themselves, so that the decisions about retaining a component for further analysis can be based upon psychometric criteria. A slightly modified approach to statistical inference, which focuses on the variance of the components in the population, is suggested. This viewpoint can be extended to estimating the true score variance and the reliabilities of the components in the S population. Psychometric tests of significance can then be made statistical in nature. (20 ref.).—*Journal abstract.*

COMPUTERS & PROGRAMING

1981. Emerson, Phillip L., Camus, Elizabeth, & Richards, Chris. (Cleveland State U.) *Two-voice music programming system: The PDP-9 as an automatic electronic organ.* *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 164-166.—Programmed a small computer to translate 2-part musical scores into tables of numbers which were then used in the execution of the music through an amplifier and loudspeaker. The objective was to create sets of tape recordings to be used in psychophysical testing of the discriminability and preferabilities of music played on different pitch scales. The close tolerances in the timing of events in such stimulus materials demand special programming techniques and hardware components. The working system is described, and recommendations are made concerning the main features of an improved system.—*Journal abstract.*

1982. Haber, Ralph N. (U. Rochester) *An alphanumeric display program for PDP-8.* *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 141-145. Aphanumeric and special characters composed of 5 × 7 dot matrices can be displayed on a CRT by use of a program written for the PDP-8 family of computers. The CRT surface is specified to contain up to 32 rows with up to 32 characters/row. The 35 dots defining each character require 1.5 msec. to generate. Every possible arrangement of spatial and temporal organization among and between strings of characters can be created by simple parameter specification before each trial. The program is designed to operate with a minimal 4k memory computer configuration, with no special hardware other than an oscilloscope display. The program also permits efficient on-line operation so that an entire experiment can be run quickly and efficiently without further programming. A large number of examples are detailed, and operating procedures are specified. *Journal abstract.*

7989. Gunnings, Thomas S. (Michigan State U.) **Response to critics of Robert I. Williams.** *Counseling Psychologist*, 1971, Vol. 2(3), 73-77.—In response to the critics of R. I. Williams' (see PA, Vol. 45:4932) article, it is contended that owing to vested interests, the representatives of corporations involved in testing materials are protecting their investment, i.e., these men have employed the argumentum ad crumenam in defense of the validity of their tests. Questions containing racial bias on tests go undetected by examiners because they are not trained to recognize them. The representatives of corporations are entailed in paradox since they admit to differences and inadequacies respecting tests, but nevertheless feel that such testing should be continued.—W. S. Sahakian.

7990. Mellenbergh, G. J. (U. Amsterdam, Netherlands) **Een onderzoek naar het beoordelen van open vragen.** [An investigation about the judging of open questions.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Feb), Vol. 26(2), 102-120.—Studied the reliability of the grading of answers to open-ended questions. The answers of 26 undergraduates about 8 questions in physiology were resubmitted to 4 judges after a 1-yr interval. All means of identification of the Ss were removed. Each week the examiners received a series of answers to certain questions. Each examiner or judge examined all the answers of all the Ss. No contamination or sequence effects were noted. The r between the total judgments of all examiners over all questions with the same judgments in the replication experiment was .976. The high reliability of the examiners was largely due to the objectivity of the answers. Although the interexaminer and test reliabilities were high, there were great differences among the judges regarding "pass-fail" decisions. In only 58% of all cases was there a complete consensus among the judges about their decisions. (English summary)—A. J. Ter Keurst.

7991. Nishisato, Shizuhiko & Torii, Yukihiko. (Ontario Inst. for Studies in Education, Toronto, Canada) **Assessment of information loss in scoring monotone items.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 91-103.—For monotone, dichotomous items, 2 interpretations of the usual scoring procedure may be made: (a) that failure of the items to form a perfect Guttman scale leads to loss of discriminative infor-

mation when the usual procedure of scoring is applied; (b) that nonunidimensionality of the item set leads to information confusion under usual scoring procedures. Measures of information loss for each interpretation are developed and tested using Monte Carlo methods. It is concluded that Interpretation b is the most appropriate.—Journal abstract.

Construction & Validation

7992. Pandey, R. N. (Government Raza Post-Graduate Coll., Rampur, India) **Construct validity of a Social Class Evaluation Scale (SCES).** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 123-124.—Kuppuswamy's Socio-Economic Status Scale (Urban) and Pandey's Social Class Evaluation Scale were both administered to a random sample of 42 10th graders. The coefficient of correlation between the 2 scales was .50.—K. C. Panda.

7993. Singh, Awadhesh K. (U. Bihar, Muzaffarpur, India) **A cross-validation of Cooper's Parent Evaluation Scales on an Indian sample.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 118-122.—Reports on the adaptation of Cooper's Parent Evaluation Scales (in Hindi) for use among students in India. Based on the responses of 100 Ss, the item analysis showed that the 6 sex items in the scale are nondiscriminatory. The final adopted version of the scales consisting of 20 items (Mother scale) and 24 items (Father scale) were administered to a fresh sample of 100 17-21 yr. old Ss. Test-retest reliability after 1 mo. and split-half reliability of the scales ranged from .87 to .92.—K. C. Panda.

EXPERIMENTATION & OBSERVATION

7994. Alexander, C. Norman & Knight, Gordon W. (Stanford U.) **Situated identities and social psychological experimentation.** *Sociometry*, 1971(Mar), Vol. 34(1), 65-82.—Introduces a new approach to the conceptualization and measurement of experimental conditions and to the assessment of the meaning of dependent-variable responses in a given condition. Contradictory and inexplicable findings are accounted for by simulating the results of a series of "insufficient justification" experiments. The hypothesis that Ss attempt to create the most favorable situated identities in experimental encounters explains why Ss answer the dependent-variable questions as they do and as Os predict. Focusing on the salience of situated identity attributes enables this approach, unlike others, to specify the differences that distinguish 1 experimental condition from another. Recommendations for a new theoretical and methodological approach to experimentation in social psychology are presented. (27 ref.)—Journal abstract.

7995. Bloom, Robert & Tesser, Abraham. (U. Georgia) **On reducing experimenter bias: The effects of forewarning.** *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 198-208.—Tested the hypothesis, 1971(Apr), Vol. 3(2), 198-208.—Tested the hypothesis, with 67 male and 70 female undergraduates, that forewarning would reduce the effects of E bias. Es were given different expectations as to how Ss would perform on a person perception task. Each E then ran a number of Ss. 1/2 of each E's Ss were forewarned of the possibility of E bias and 1/2 were not forewarned. The hypothesis is supported among females ($p < .05$) but could not be tested among males as the effect of E expectancy did not

manifest itself. (French summary) (16 ref.) *Journal abstract*.

7996. Brandt, Lewis W. (U. Saskatchewan, Regina, Canada) **Science, fallacies and ethics.** *Canadian Psychologist*, 1971(Apr). Vol. 12(2), 231-242. —Discusses psychological experiments with human Ss which are frequently based on faulty assumptions which may lead to erroneous conclusions and warped ethics. Motivational studies often assume implicitly and without empirical evidence different motives in E and in S for participating in the experiment. The principle of parsimony requires a single explanation for E's and S's behavior when it is virtually identical. S. Milgram's experiments on "obedience" are used to illustrate the application of identical explanatory principles to E's and S's behavior and are shown to have tested the release of aggression in a situation which facilitated the use of rationalization and displacement. Experiments with human Ss are shown to be undemocratic and unnecessary in instances where the behavior of the Ss can be predicted from E's behavior. (French abstract) (28 ref.)—*Journal abstract*.

7997. Holmes, Douglas S. & Jorgensen, Bruce W. (Smith Richardson Foundation, Greensboro, N.C.) **Do personality and social psychologists study men more than women? Representative Research in Social Psychology**, 1971(Jan). Vol. 2(1), 71-76. —Examined issues of 3 relevant journals published in 1966, as well as all issues of a single journal in 1946 and 1956, for sex and source of Ss. Males appeared as Ss twice as often as females, a ratio even greater than that favoring college student Ss over noncollege student Ss. The bias in favor of studying males is as great or greater with noncollege student Ss as with college Ss. Implications of this bias are discussed.—*Journal abstract*.

7998. Keisner, Robert H. (C.W. Post Coll., Long Island U.) **Debriefing and responsiveness to overt experimenter expectancy cues.** *Journal of Social Psychology*, 1971(Jun). Vol. 84(1), 65-71. —Attempted to determine the relationship between prior debriefing experience and reactions to perceived E expectancies. It was hypothesized that debriefed Ss would be suspicious of perceived E expectancy cues and hence less likely to respond to such cues. Immediately prior to a word-association task, all Ss (N = 39 undergraduates) were informed by the E that he expected emotional words to produce longer response latencies than neutral words. Ss who had been debriefed in a prior experiment showed smaller RT difference scores in the (perceived) expected direction than nondebriefed Ss ($p < .05$). Explanations not involving suspicion were explored.—*Author abstract*.

7999. Noranchuk, T. A. (Harvard U.) **Pretesting effects: An inductive model.** *Sociometry*, 1970(Mar). Vol. 33(1), 12-19. —Reanalyzes the literature on the direct and interactive effects of pretesting with a view toward generating a simple additive model which would account for the various research findings. A model is proposed with 2 conceptual variables: (a) the effect of making a conscious decision, and (b) the effect of presentation of information in the pretest and subsequent experimental manipulation. 9 studies are examined in which the model accounts for both the orders and the approximate magnitudes of effects reasonably well.—*Journal abstract*.

APPARATUS

8000. Blau, Dan. (Hadassah U., Medical School, Jerusalem, Israel) **A simple device for moving an**

electrically driven micro-manipulator. *Electroencephalography and Clinical Neurophysiology*, 1971(May), Vol. 30(5), 465.

8001. Fitzhugh, Robert J. & Katsuki, David. (U. Pittsburgh, Learning Research & Development Center) **The touch-sensitive screen as a flexible response device in CAI and behavioral research.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 159-164. —Describes and evaluates 2 different touch-sensitive surface units from a technical and an applications standpoint, with particular emphasis on their use as response devices in computer-assisted instruction with young children. Several other interesting touch-sensitive surface concepts and laboratory applications are also described.—*Journal abstract*.

8002. Glasgow, Barry. (U. Minnesota) **Voltage sensing with a unijunction transistor.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 129-130. —Describes a voltage-sensing device with very little hysteresis and variable threshold voltage setting. Application of the device as a voltage-sensitive variable-duration monostable multivibrator in recording rabbit nictitating membrane conditioning is also discussed.—*Journal abstract*.

8003. Justesen, Don R., King, Nancy W., & Clarke, Rex L. (Veterans Administration Hosp., Kansas City Mo.) **Unavoidable gridshock without scrambling circuitry from a faradic source of low-radio-frequency current.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 131-135. —Describes a high-voltage radio frequency stimulator used as a source of motivational footshock in studies of conditional suppression. The circuit of the stimulator is presented schematically, then discussed in terms of affect induced by, gross behavioral response to, and electrical characteristics of, the stimulus. Near daily use of the stimulator across 6 mo. of formal assessment revealed that nonscrambled presentations of footshock via a grid of aluminum bars invariably resulted in stimulation of 3 adult male albino rats and generated highly efficient conditional suppression of operant responding. While the stimulator was primarily designed to permit unfounded presentation of gridshock in a 2,450-MHz microwave field, its simplicity and reliability suggest application in other situations requiring motivational shock.—*Journal abstract*.

8004. Kobrick, John L. & Sutton, William R. (U.S. Army Research Inst. of Environmental Medicine, Natick, Mass.) **Device for measuring voluntary response time to peripherally placed stimuli.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 255-258. —Presents a technical description and circuit schematic in sufficient detail for fabrication of a device for presenting visual stimuli at points throughout the visual field and measuring the associated response times. The device is relatively simple and inexpensive to construct, employs transistorized logic, and features completely silent operation to avoid extraneous stimulus cues to S.—*Journal abstract*.

8005. Mundl, William J. (McGill U., Allan Memorial Inst., Montreal, Quebec, Canada) **A small pulse generator for calibrating EEG recording systems.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 138-139. —Describes a battery-powered pulse generator of uncomplicated circuit arrangement which has the advantage of being easily constructed and can be positioned in a confined testing area to simulate the low-amplitude signals of an S. It

may be especially useful for EEG recording systems for small animals. In this way, the complete recording system, including connecting cables, can be calibrated, and its performance readily assessed with respect to frequency response and to susceptibility to noise pickup.—*Journal abstract.*

8006. Potts, W. Joseph & East, Peter F. (G. D. Searle & Co., Chicago, Ill.) **A simple epidural cannula for the rat.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 136-137.—Describes a simple epidural cannula for use with small animals. Bilateral implantation of cannulae in rats is discussed, and it is noted that during laboratory use these cannulae have not been damaged even when implanted in rats undergoing shuttle box testing. In contrast to some other methods of eliciting spreading cortical depression in rats, the cannula described here cannot easily cause a mechanical spreading depression since the rigid fixing practically eliminates any possibility of its movement.—*Journal abstract.*

8007. Rettig, Gayle M. (Baylor Coll. of Medicine, Houston, Tex.) **A head-holding device for repeated micro-electrode studies in monkeys during operant responding.** *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 462-464.—Describes a device for the rigid fixation of a fully conscious, freely responding monkey during microelectrode recordings from single cortical units. (French summary)—*Journal summary.*

8008. Sperling, George. (Bell Telephone Lab., Murray Hill, N.J.) **Flicker in computer-generated visual displays: Selecting a CRO phosphor and other problems.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 151-153.—The visual system's response to flicker is approximated by 6-9 RC stages in series. The cathode ray oscilloscope (CRO) phosphor can be represented by 1 additional RC stage. Therefore, increasing the refresh rate by a factor of k can be k' to k^8 times more effective in reducing apparent flicker than increasing the phosphor time constant. "Slow" phosphors impair the display of rapid movement and cause undesirable persistence of old picture contents after they have been altered. Behavioral scientists usually should choose fast, efficient phosphors. Display programs should be written so that spatially adjacent points of a display are intensified as close together in time as possible.—*Journal abstract.*

8009. Sperling, George. (Bell Telephone Lab., Murray Hill, N.J.) **Stereoscopic visual displays: Principles, viewing devices, alignment procedures.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 154-158.—The principle of binocular (stereoscopic) depth perception is that the visual system interprets the slight differences between the views seen by the 2 eyes as depth cues. In computer-generated displays, 2 slightly different images are produced on the left and right halves of the display surface and viewed by a prism, mirror, or binoculars system that delivers the appropriate image to each eye. The prism system is the simplest, the mirror system gives the best optical quality, and the binoculars system is useful for producing large apparent images from small display surfaces. All 3 systems can be adapted for group viewing and all require careful alignment (null adjustment of accommodative distance and vergence distance). Objective and subjective methods of alignment are described.—*Journal abstract.*

8010. Sperling, George. (Bell Telephone Lab., Murray Hill, N.J.) **The description and luminous calibration**

of cathode ray oscilloscope visual displays. *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 148-151.—A description of a cathode ray oscilloscope (CRO) display should include descriptions of (a) typical display contents (e.g., a photograph); (b) CRO output parameters (e.g., refresh rate); and (c) luminous measurements. Luminous calibrations are unorthodox because CRO displays are discontinuous in space and time, and because they are sources, not reflectors, of light. The appropriate luminous quantities are luminous intensity and the integral of luminous intensity, luminous directional energy (LDE); the appropriate measurements are LDE/point and of LDE unit line length. A simple calibration procedure is described, and the formulas relating these quantities to luminances are given.—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

8011. Buck, Lucien A. (Dowling Coll., Oakdale, N.Y.) **Varieties of consciousness: Comparison of some cognitive characteristics.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 183-186.—Describes and contrasts a variety of states of consciousness. Ss were 16 female and 33 male undergraduates who filled out a questionnaire which included 9 states of consciousness. Results indicate that dreams, hypnagogic and hypnopompic experiences, depersonalization, déjà vu, synesthesia, and daydreams can be differentiated by means of a series of descriptive characteristics. *Journal abstract.*

8012. Wright, Patricia. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Linguistic description of auditory signals.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 244-250.—Studied the extent of agreement between adult Ss' verbal descriptions of tones differing in pitch, intermittency, and modulation. In Exp I with 17 Ss, there was greater consistency across Ss when descriptions referred to the tone's physical characteristics than when onomatopoeic and illustrative terms (e.g., bleep, hooter) were used. Onomatopoeic labels appear to convey no more specific information than general terms (e.g., sound). However, even when labeling physical characteristics there was usually high agreement for only 1 feature of the stimulus, although the salient dimension varied with different signals. Exp II with 22 Ss used multiple-choice procedure. If Ss had to label each tone along 2 physical dimensions, the consistency between Ss increased in accordance with the predictions of a model which assumes that judgments are made along each dimension independently, then combined probabilistically. Exp III, with 8 groups of 13-17 Ss each, more closely examined the distribution of verbal labels along the pitch dimension. Data indicate 95% agreement between Ss for the description of isolated pure tones (heard only once and therefore without background or reference tones) if these were above 600 or below 200 Hz. *Journal abstract.*

PERCEPTION

8013. Baird, John C., Kreindler, Michael, & Jones, Kenneth. (Dartmouth Coll.) **Generation of multiple ratio scales with a fixed stimulus attribute.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 399-403. De-

scribes 2 opposing psychophysical theories which differ in the relative weight given to sensory and cognitive variables. An experiment was designed to vary a cognitive factor while maintaining a constant sensory factor. The method of magnitude estimation was used with the constant stimulus attribute of line length. The cognitive factor was varied by providing 80 male undergraduates with different feedback concerning the numerical values assigned to the largest and smallest lines in the series. This procedure led to multiple ratio scales for the same stimulus attribute. It is concluded that these results support a theory which stresses both cognitive and sensory variables in the explanation of psychophysical functions. *Journal abstract.*

8014. Curti, Jean & Zenhausen, Robert. (St. John's U., Jamaica, N.Y.) Perception of mechanical causality. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 63-70.

8015. Gibby, Robert G., Gibby, Robert G., & Townsend, John C. (Virginia Commonwealth U., Richmond) Short-term visual restriction in visual and auditory discrimination. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 15-21. Explored the effect of sensory restriction on perceptual thresholds. The experimental predictions were formulated from D. B. Lindsay's model of the reticular activating system (RAS). Changes in the visual CFF threshold, loudness discrimination, and pitch discrimination as related to 2 levels of visual restriction were noted. Ss were 60 adult male volunteers. Statistical analysis included analysis of covariance followed by a priori group comparisons. Statistical support ($p < .05$) was found for 3 of 4 general hypotheses. It is concluded that the RAS attempts to maintain cortical arousal at an optional level by regulating stimulus input. A reduction in this input apparently lowers perceptual thresholds in the sensory system restricted and other systems as well. (16 ref.) *Journal abstract.*

8016. John, I. D. (U. Adelaide, South Australia) Stimulus discriminability and anchor effects in judgments of lifted weights. *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 19-28. Describes an experiment in which 3 groups of 10 undergraduates made absolute (identity) judgments of lifted weights under no anchor (NA), heavy anchor (HA), and light anchor (LA) conditions. No contrast effect induced by LA could be demonstrated but HA induced a significant contrast effect. It is concluded after an examination of response uncertainty conditional upon the individual stimuli, response speed scores, and confidence scores that the primary effect of HA was to reduce the relative discriminability of series stimuli nearest HA and to increase the relative discriminability of those stimuli furthest from HA. *Journal abstract.*

8017. Kubovy, Michael; Rapoport, Amnon, & Tversky, Amos. (Hebrew U., Jerusalem, Israel) Deterministic vs. probabilistic strategies in detection. *Perception & Psychophysics*, 1971(May), Vol. 9(5), 427-429. Investigated the use of a binary detection task, free from sensory components. Results with 6 male and female undergraduates (a) confirm a deterministic model prescribing a fixed cutoff point; and (b) do not support a probabilistic model, which generalizes W. Lee's micro-matching model for externally distributed stimuli. *Journal abstract.*

8018. Perlmuter, Lawrence C., Karsh, Robert, & Imble, Gregory A. (Bowdoin Coll.) The effect of a

conditioning procedure upon the judgement of weights. (U.S. Army Human Engineering Laboratories Technical Memorandum, 1970(Jul), No. 17-70, 5 p.)

Reports 2 experiments in which a visual stimulus of 1 different hue was paired with 2 lighter weights and a stimulus of 2 different hue was paired with 2 heavier weights. Ss were 60 army enlisted men in Exp. I and 37 in Exp. II. The purpose was to determine whether these visual stimuli would be effective in distorting the judgments of the heaviness of 1 weight lying midway between the lighter and heavier weights. Results of Exp. I, using a between-Ss design, indicate that the judgment of the middle weight is significantly affected by the stimuli. A within-Ss design in Exp. II failed to reveal a reliable effect of the stimuli upon the rated heaviness of the test weight. *Journal abstract.*

8019. Pick, Herbert L., & Ryan, Sarah M. (U. Minnesota, Inst. of Child Development) Perception. *Annual Review of Psychology*, 1971, Vol. 22, 161-192. Reviews work on perception published between January 1968 and December 1969. Areas include (a) information integrated across time (perception of time, motion perception, perceptual aftereffects, and temporal limits of perceptual information); (b) multiple sources of sensory information (sensory interaction and intermodal relations); (c) multiple sources of information—sensory integration (simultaneous bilateral stimulation, integration of information in size perception, perception of distance or depth and context effects); (d) organization and coding of perceptual information; (e) selection of perceptual information (types of selectivity and changes in selectivity); and (f) motor components in perception (310 ref.). *P. Herzberg.*

8020. Rubinstein, Leo & Gruenberg, Ernest M. (Columbia U.) Intramodal and crossmodal sensory transfer of visual and auditory temporal patterns. *Perception & Psychophysics*, 1971(May), Vol. 9(5), 385-390. Measured temporal pattern perception for vision and audition using pair comparisons of precisely determined rhythms as test items in 2 experiments with a total of 13 male and 17 female staff members, student nurses, and graduate students. Visual rhythms were more difficult to match than comparable auditory ones. Cross-modal transfer equaled intramodal transfer in 1 experiment but was inferior in another. The differences between intra- and cross-modal transfer were related to the frequency of pattern elements, with cross-modal performance decreasing more when frequency rose. The 9 test items showed a consistency in relative difficulty across experimental conditions. Differences in item difficulty are related to the symmetry of the 1st pattern in the item. (17 ref.) *Journal abstract.*

8021. Stevens, Joseph C. & Marks, Lawrence E. (John B. Pierce Foundation Lab., New Haven, Conn.) Spatial summation and the dynamics of warmth sensation. *Perception & Psychophysics*, 1971(May), Vol. 9(5), 391-398. Thermally irradiated at various levels of intensity various areal extents of the forehead and back of 32 male Ss. Results indicate that for any areal extent, the degree of apparent warmth increased approximately as a power of apparent warmth level, the larger the area, the smaller the exponent of the power function. 2 families of psychophysical functions, 1 for the forehead and the other for the back are distinguished. It is suggested that (a) the power functions extrapolate to a point of convergence in the neighborhood of the threshold for

pain and tissue impairment. (b) the rules that govern summation of warmth are revealed in the 2 families, and (c) intensity and area trade one for the other to preserve the same level of warmth. It is concluded that at faint sensation levels, reciprocity is the rule of trading; but with increasing sensation level, area makes a weaker and weaker relative contribution to warmth, and, as a result, it takes a larger and larger percentage change in area to offset a given percentage change in intensity (32 ref.).—*Journal abstract.*

8022. Thompson, A. H., Dewar, R. E., & Franken, R. E. (U. Calgary, Alberta, Canada) A test of the set disruption interpretation of perceptual defense. *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 222-227.—Trained 16 male undergraduates to the affective signal value of 2 symbols. 1 symbol served as a signal for taboo words, and the other as a signal for neutral words. Results show that when words in the test phase were preceded by the taboo signal, a higher recognition threshold was obtained than when words were preceded by a neutral signal. This effect was found to be independent of the affect of the word that followed the signal. Results are interpreted as casting doubt on the possibility that data supporting perceptual defense can be interpreted on the basis of some form of set disruption. (French summary)—*Journal abstract.*

Illusion

8023. Levy, J., Singer, G., & Austin, Margaret. (Columbia U.) **Differences in the tilted room illusion resulting from learning.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 63-67. -Examined the findings that in the tilted room illusion (TRI) (a) Ss judging verticality use conflicting visual (V) and non-visual (NV) cues, (b) consistent individual differences occur, and (c) sex differences develop with age. The hypothesis that learning contributes to these differences was tested by attempting to find a training situation which altered the TRI. In Exp. 1, 5 groups of 14 undergraduates were trained in different judgments. 3 groups showed a reduction in the TRI compared to a group of 14 Ss who received no training. A preliminary experiment in which 4 Ss were intensively trained, each in a different task, indicated that the TRI was reduced only when the NV cues were positively reinforced in a V-NV cue conflict situation. Intensive training which reinforced either modality, in situations where there was no intermodal discordance, had no effect. -*Journal abstract.*

8024. **Richards, Whitman & Miller. J. F.** (Massachusetts Inst. of Technology) **The corridor illusion.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 421-423.—Reports a study, with 7 Ss. of the classical corridor illusion which indicates that, contrary to general belief, the illusion is not due solely to the perspective and contextual cues provided by the corridor. Additional factors that are equally important are the inherent spatial anisotropies of the visual system and fixation tendencies.—*Journal abstract.*

Time

8025. Burnside, William. (Indiana U.) Judgment of short time intervals while performing mathematical tasks. *Perception & Psychophysics*, 1971(May), Vol. 9(5),

404-406.—Tested the suggestion of R. Ornstein that the apparent duration of a time interval depends upon the memory storage size. Duration estimates made while performing different types of information processing were studied. 12 female and 8 male undergraduates served in each of the 30 conditions of the experiment. The 6 time intervals estimated by the method of reproduction were 10, 12, 14, 16, 18, and 20 sec., and the 5 intervening tasks were doing nothing, reading numbers, adding, multiplying, and adding and multiplying in a random order. Results show that (a) fewer items were output in the 3 arithmetic conditions, as compared with the reading conditions; and (b) the duration estimates were shorter for these 3 conditions. Estimates of duration are related to amount of output, and also appear to be related to the type of processing done to produce this output.—*Journal abstract.*

8026. **Shectman, Frederick A.** (Menninger Foundation, Topeka, Kan.) **Time estimation, sequence effects and filling activities.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 23-26.—60 male undergraduates were randomly and equally divided into 3 groups (2 experimental, 1 control) to investigate the effect of lack of feedback on sequential temporal estimates. The production method was employed, as was a "filling" task designed to be cognitively related to Ss' future expectations. As predicted, systematic changes occurred across trials for all groups, independent of differential expectations. Results were related to "judgment drift" and to the nature of the interpolated filling activity. —*Journal abstract.*

8027. Singh, Labh. (Government Raza Post-Graduate Coll., Rampur, India) **Motivation and progress effects on psychological time in Indian communities.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 100-103. 40 male college students from each of 4 major Indian communities (Hindu, Muslim, Sikh, and Christian) made a subjective comparison between the length of 2 6-min periods of time. The 1st period was spent in looking at a photographic magazine and the 2nd working on a letter cancellation sheet. For the 2nd period, Ss were assigned to 1 of 2 motivation conditions, high or low, and 1 of 2 progress conditions, fast or slow. The experiment was replicated for each of the 4 communities and each group's data were analyzed in a factorial design with motivation and progress rates as independent variables and time estimation as a dependent variable. At the end, Ss compared the 2 periods of time. For the Sikh and Christian Ss the time estimates were inversely related to progress under high motivation but unaffected under low motivation. No other effect was significant. *Journal summary.*

8028. Voronin, L. G. & Konovalov, V. F. (Moscow State U., USSR.) *Fiziologicheski analiz vzaimodel'stviya osoznannykh i neosoznannykh sledovykh protsessov pri otschëte vremeni.* [Physiological analysis of the interaction of conscious and unconscious trace processes in estimating time.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 899-907. 18 18 24 yr. old Ss participated in a study to determine (a) whether the assessment of time is a conscious or unconscious act, and (b) if the act is neither wholly conscious nor unconscious, what are the interrelationships between these 2 aspects in "accurate and adequate" estimates of time intervals. Recordings were made of the cortical EEG, GSR, and oculomotor reaction. Condi-

tioned trace reactions were formed to acoustic, tactile, and proprioceptive stimuli with photic reinforcement 6, 9, 15, and 30 sec. after cessation of the CS, whose duration varied from .5-8 to 3 sec. 2 attitudes were utilized: (a) "passive" (eyes were to be opened or closed when reinforcement was presented), and (b) "active" (opening or closing in anticipation of the time when it should be necessary to perform these acts). It was shown that a passive attitude during the experiment led to the formation of traces primarily at the level of the 1st signal system. Therefore, these trace processes were brought with difficulty to the level of awareness, tending strongly to remain below it. In the case of an active attitude, an interaction was observed between conscious and unconscious processes with the possibility of mutual transition. Basic to the reproduction of temporal trace processes was the "biological clock" mechanism which appeared to be capable of functioning at the level of both the 1st and 2nd signal systems. (English summary) (16 ref.) *J. D. London.*

VISION

8029. Bradshaw, John L. & Wallace, Graeme. (Monash U., Clayton, Victoria, Australia) **Models for the processing and identification of faces.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 443-448.—Constructed 240 representations of human faces from Identikit in a comparison of several possible models of information processing relating to facial recognition. Results with 10 female and 8 male undergraduates did not indicate (a) evidence that faces were treated as unitary Gestalten, or (b) that the component features were processed to any significant extent in parallel. The best theoretical model to fit the data involved serial self-terminating processing, without replacement. Task difficulty, determining both processing time and number of errors made, was a function of the number of critical features present and the orientation (upright or inverted). Photographic negatives were handled the same as positives. The more difficult the task, the stronger the evidence for a serial model and the greater the effects of practice. The latter suggests that, given time, Ss could handle inverted presentations as readily as upright ones, and that inversion may merely increase the difficulty in separating out the individual features for subsequent processing.—*Journal abstract.*

8031. Krol', T. M. (Leningrad State U., USSR) **O forme zavisimosti absol'yutnogo svetovogo poroga ot gradienta stimula.** [On the form of the function relating absolute photic threshold to gradient of the stimulus.] *Nervnaya Sistema*, 1969(Dec), No. 10, 163-168.—26 normal dark-adapted Ss participated in a study to determine the functional relationship between exold) and rate of increase of the photic stimulus under the conditions obtaining in usual adaptometric techniques. The lowest and least fluctuating threshold for all Ss was found for instantaneously increasing stimuli lasting for a period of time not less than the "useful." Denoting the average value of this threshold by R_0 , it was found that stimuli, increasing at the rate of 4-12% R_0 /sec, entailed a

heightened excitability as compared to stimuli increasing at both a faster and slower rate. An empirically derived function is exhibited.—*J. D. London.*

8032. Jakner, Edward W. (U. Illinois) **Recognition of numerals imbedded in words, pronounceable non-words, and random sequences of letters.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5661.

8033. McKeever, Walter F. & Huling, Maurice D. (Ventura County Mental Health Dept., Calif.) **Lateral dominance in tachistoscopic word recognition performances obtained with simultaneous bilateral input.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 15-20. Presented 18 right-handed undergraduates with a monocular tachistoscopic word recognition task. The method employed was that of simultaneous presentation of 2 words at a time, 1 word to the left and 1 to the right of fixation. All Ss recognized more right than left field words. Right field superiority was significant across all Ss ($p < .001$) and for both right and left eye viewing groups (both $p < .005$). Results contradict the traditional belief in left field superiority with bilateral word presentation and support a theoretical model which attributes the observed effects to a longer neural pathway from right hemiretinae to left hemisphere language centers. Greater transmission fidelity and lesser transmission time of the shorter pathway are proposed as factors underlying right field superiority. 8034. Shaitor, E. P. (Leningrad State U., USSR) **Rol' mikrointerval'nogo vzaimodeistviya nervnykh protsessov v akkomodatsii glaz.** [Role of micro-interval interaction of nervous processes in visual accommodation.] *Nervnaya Sistema*, 1969(Dec), No. 10, 169-171. Proposes a process of accommodation in which the visual system does not utilize information concerning the distance of objects. The scheme appears valid when the visual system can utilize, as signals for the determination and sign of accommodation, only the optic disturbances of the image caused by aberration and astigmatism. Observation of an object in this case is secured by the interaction of 3 processes: (a) pupillary contraction, increasing the depth of sharpness and approximating the hyperfocal point; (b) change in crystalline curvature; and (c) retrograde masking of sensation, elicited by the nonsharp image, under the action of sensation elicited by the image of the object focused on the retina.—*J. D. London.*

Perception

8036. Bishop, P. O. & Henry, G. H. (Australian National U., Canberra, Australia) **Spatial vision.** *Annual Review of Psychology*, 1971, Vol. 22, 119-160.—Discusses 2 aspects of spatial perception which are ordinarily not distinguished from each other: (a) spatial constancy of the visual environment, and (b) the spatial qualities or attributes of form or pattern perception. The former refers to the stability of objects in the face of the constant movement of the eyes, head, and body. The latter relates the spatial attributes of form perception to the spatial order of the contour features of individual objects, and the orientations and spatial relationships

between various objects in the field of view. Sensory and motor aspects of monocular spatial vision are reviewed, and stereopsis is shown to be distinct from the other 2 aspects of spatial perception. (201 ref.)—*P. Hertzberg.*

8037. Bjork, Elizabeth L. & Estes, William K. (Rockefeller U.) **Detection and placement of redundant signal elements in tachistoscopic displays of letters.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 439-442.—Conducted a forced-choice detection experiment with 3 female laboratory technicians and 1 female undergraduate. On each trial, S indicated which of 2 signal elements was represented and specified the cell of the 5×5 matrix display in which she detected the signal. RT on correct choice, correct placement trials, proved virtually invariant with respect to number of redundant signal elements present in the display. Data do not support a serial model for sensory processing, but could be accommodated by a parallel model for sensory processing together with a serial self-terminating model for processes involving comparison of elements of a display with items in memory. Further analyses of both frequency and RT data support the assumption that the distributions of observed detection response measures represent mixtures of true detections, guesses, and misperceptions.—*Journal abstract.*

8038. Delorme, André. (U. Montreal, Inst. of Psychology, Quebec, Canada) **La perception de la vitesse en éclairage intermittent.** [The perception of speed in intermittent light.] *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 213-221.—Investigated the effects of frequency (flickering light) on the perception of linear velocity. 10 undergraduates adjusted the speed of a continuously illuminated comparison target by reference to an identical target illuminated by flickering light. The experiment was conducted with 2 kinds of targets (vertical bars and textures of random points) and under 5 conditions of intermittency (3, 6, 9, 12, and 15 cps) plus a control condition (both targets continuously illuminated). Velocity was overestimated in all conditions of flickering light. This overestimation was found to vary as an inverted U shape function for both targets and was quantitatively higher for texture targets than for bars. Results are discussed with reference to Piaget's theory of the perception of velocity and to electrophysiological data on brightness enhancement.—*English summary.*

8039. Dodwell, P. C. (Queen's U., Kingston, Ontario, Canada) **On perceptual clarity.** *Psychological Review*, 1971(Jul), Vol. 78(4), 275-289.—Presents a model to account for perceptual clarity. Under the normal conditions of visual perception (slow receptor response, rapidly changing input), much interference might be expected between sequences of successive time samples of retinal input, perceptual clarity being attained under normal circumstances by a form of autocorrelation. The model serves to explain R. Haber's repetition-clarity effect, the fading and regeneration of stabilized images, visual acuity in the presence of eye movements, short-term storage, and other sequential processing effects. A plausible neurophysiological basis for the correlational operations is found in the mammalian visual contour coding system. (56 ref.)—*Journal abstract.*

8040. Elsner, William. (U. Florida, Coll. of Medicine) **Power laws for the perception of rotation and the oculogyral illusion.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 418-420.—Used magnitude estimation to measure subjective motion for 2 indicators of

vestibular function. 12 male 21-40 yr. old Os made estimates of 5-sec pulses of angular acceleration across the range of angular acceleration \times time (at) = 10-150 deg/sec. Results indicate that (a) the power law described subjective motion for all individual Os, (b) the power function exponent (1.41) for the perception of rotation was slightly greater than the exponent (1.25) for the oculogyral illusion, (c) a significant number of Os gave higher exponents for the perception of rotation, and (d) the magnitude estimates of the oculogyral illusion and perception of rotation were highly correlated within and across Os. (17 ref.)—*Journal abstract.*

8041. Hall, Robert J., Monty, Richard A., & Wilsoncroft, William E. **The effect of moving and static trans-scleral illumination of visual afterimages.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Jun), No. 14-70, 4 p.—Illuminated the inside of the eye by shining a small light through the upper eyelid and the sclera. After viewing a bright flash, Ss closed their eyes and reported the duration of the afterimage under the following conditions: (a) the light on and moving across the S's eyelid (moving transscleral illumination); (b) the light on but stationary (static transscleral illumination), and (c) 2 corresponding control conditions in which the light was turned off (darkness). Results indicate that when the transscleral light is moving, afterimages are seen clearly for periods of approximately the same duration as those seen in complete darkness. However, when the transscleral illumination is stationary, the duration of the afterimages is significantly reduced. These results are compatible with other afterimage data that suggest that changes within the field after initial stimulation are needed to prolong afterimages. *Journal abstract.*

8042. Hogben, John. (U. Western Australia, Nedlands) **Interaction of forward and backward visual masking.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 487-488.—Investigated the interaction of the forward and backward masking effects of unpatterned visual stimuli in 10 undergraduates. It was found that detection of a test spot was easier under conditions that should have provided both forward and backward masking than under either forward masking or backward masking alone. Implications for an integration theory of masking are discussed. Findings are contrasted with those on the interaction of forward and backward masking by dynamic visual noise. *Journal abstract.*

8043. Kimball, Kent A. (U. South Dakota) **Estimation of intersection of two converging targets as a function of speed and angle of target movement.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 307-310.—Examined the effects of target velocity and angle of approach on the accuracy of intersection estimation of 2 moving targets. An inferred movement display was utilized in which 2 rows of lights, flashing serially across the display, simulated 2 moving targets. 5 different target velocities and 2 angles of approach (30° and 90°) were used. The targets were displayed halfway to the actual intersection point. Ss' task was to observe the targets until they disappeared and then indicate when they intersected. Ss were 15 male college students. Each S was given 100 trials. Raw data in the form of the difference between estimated and actual intersection time were collected and converted to constant and absolute error scores for each trial. In 3-factor analysis of variance with repeated measures on 2 variables, target velocity and angle of approach were significant sources of variation.

2nd- and 3rd-order interactions between angle, speed, and Ss were also statistically significant. Time estimations were converted to velocity estimates, and standard deviations of estimates were plotted against mean velocity estimates. A linear function was obtained similar to that reported by R. H. Brown—*Journal abstract*.

8044. Leibowitz, Herschel W. & Saccia, Elizabeth J. (Pennsylvania State U.) Comparison of matching and drawing in the perception of shape at various intelligence levels. *Perception & Psychophysics*, 1971(May), Vol. 9(5), 407-409.—Investigated the tendency toward shape constancy, using both the traditional matching technique of R. H. Thouless and free-hand drawing of the stimulus object. Data were obtained for 36 undergraduates and 33 institutionalized feeble-minded Ss at 3 levels of intelligence. The previous observation that Ss of higher intelligence level produce a lower tendency toward shape constancy, as measured by the matching method, was confirmed. With the drawing method, the same trend was observed but differences among groups were exaggerated. The sensitivity of measures of perceived shape to experimental and nonexperimental variables is discussed. *Journal abstract*.

8045. Pollack, Irwin. (U. Michigan, Mental Health Research Inst.) Perception of two-dimensional Markov constraints within visual displays. *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 461-464.—Describes a method for constructing visual displays in which statistical constraints are encoded within 2 spatial dimensions without introducing 1-dimensional linear constraints. Within each local group of 4 elements, the state of 1 element is determined with a given probability by the previously generated states of the other 3. In 2 experiments with a total of 40 undergraduates, Ss rated such displays on a scale from "lumpy" (crude texture) to "lacy" (even texture). The consistency of classification obtained for displays with strong aggregated ("lumpy") properties was substantially higher than that obtained for displays with strong distributed ("lacy") properties. An incidental feature of Ss' behavior was their deliberate degrading of the visual quality of the displays. Comparison is made with 1-dimensional displays concatenated in 2 dimensions.—*Journal abstract*.

8046. Pollack, Irwin. (U. Michigan) Temporal anagrams: Word identification with successively presented letters in scrambled order. *Perception & Psychophysics*, 1971(May), Vol. 9(5), 430-434.—Displayed high-frequency 7-letter words, letter by letter in scrambled temporal orders, upon an oscilloscope to 24 undergraduates. After each incorrect identification, the sequence was repeated. Highest word-identification scores were obtained with initial and terminal starting positions, with shortest and longest spacing between successive letters, and at the slowest and fastest rates of letter presentation. The relative contribution of each variable was maintained in combination with other variables. The conditional probability of a correct word identification given that the word was not identified on a previous presentation, plunged sharply with successive presentations. This apparent nonindependence of performance over successive presentations is shown to be an artifact of pooling the results of heterogeneous experimental variables.—*Journal abstract*.

8047. Roland, Billy C. (East Texas State U.) Relationship between GSR, heart rate, and reversibility

of a Necker cube. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 36-38.—Cold-pressor stimulation significantly increased the reversal rate of the Necker cube for 84 undergraduates instructed to observe passively. A moderate negative relationship was found between GSR and the number of reversals ($r = -.35$) while a small positive relationship existed between heart rate and cube reversal ($r = .22$).—*Journal abstract*.

8048. Sekuler, Robert; Lehr, Donald; Stone, William, & Wolf, Mark. (Northwestern U.) Human visual motion sensitivity: Evidence against a ratio theory of sensory coding. *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 483-484.—Measured luminance thresholds in 2 Ss for downward moving contours under several conditions of adaptation. Included was 1 condition which desensitized visual mechanisms responsive to downward motion. Another condition exerted equal effects on both up- and down-sensitive mechanisms. Thresholds for moving contours were unaffected by exposure to contours which moved in the opposite direction. Results indicate that the perception of motion does not depend upon the relative activity in oppositely tuned, directionally selective visual mechanisms.—*Journal abstract*.

8049. Singh, Balbir. (U. Southern California) Recognition of alpha-numeric characters in the presence of visual noise. *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5879-5880.

8050. Strickland, F. R. & Day, R. H. (Monash U., Clayton, Victoria, Australia) Aftereffect of visual movement: Storage in the absence of a patterned surround. *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 485-486.—Reports results of an experiment with 12 paid volunteer Ss on the aftereffect of visual movements. Storage of the aftereffect was shown to occur if, after movement, the stationary target remained clearly visible in a surround that was dark and featureless. This finding is considered in terms of the earlier observation that the movement aftereffect is reduced or eliminated when the target surround is featureless. It is noted that current hypotheses in terms of direction-specific units cannot easily explain the storage of the movement aftereffect.—*Journal abstract*.

8051. Townsend, J. T. (Purdue U.) Alphabetic confusion: A test of models for individuals. *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 449-454.—Examined the ability of recognition and scaling models to explain data at the individual level. The confusion characteristics of the English uppercase alphabet were compared between 2 female undergraduates and between the individual Ss and group-averaged data from a previous study. The choice and overlap models were superior to the all-or-none model in predicting the empirical confusion matrices and tended to explain the data structure in a similar manner. Multidimensional scaling analysis supports a Euclidean metric and suggests 4 or 5 underlying stimulus dimensions. Compared to the group study, the choice and overlap model appeared to fit as well or better at the individual level than at the group level and the all-or-none model to fit worse. In the present study, probability correct was fit even better by the all-or-none model. Individuals and the group were consistent in their sensory confusions as represented by similarity parameters but differed in their response biases. A simple measure of physical similarity explained 50% of the variance of the similarity structure in the confusion data.—*Journal abstract*.

8052. Williams, Mary J. & Collins, William E. (FAA,

Civil Aeromedical Inst., Psychology Lab., Oklahoma City, Okla.) **Some influences of visual angle and retinal speed on measures of the spiral aftereffect.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 215-227.—Judged the duration and intensity of the spiral aftereffect (SAE) under 5 conditions: (a) angle constant—retinal speed and visual angle were held constant across several spiral-size, viewing-distance combinations; (b) size-constant—a single spiral size was used at several distances, with retinal speed either varied (S_1) or held constant (S_2); and (c) distance constant—several spiral sizes were used at a constant distance with retinal speed either varied (D_1) or held constant (D_2). Ss were 10 20-29 yr. old male paid volunteers who met certain visual requirements. Duration and intensity measures were affected similarly, with perceptual rather than physical variables seeming to account for the results. Assuming that perfect size constancy occurred during the experiment, SAE durations were longer, in general, for larger values of perceived size/unit of retinal size. Retinal speed variation had no apparent influence, except possibly at low values. (18 ref.)—*Journal abstract.*

Size & Distance & Depth Perception

8053. Kuroda, T. (Kagoshima U., Japan) **Distance constancy: Functional relationships between apparent distance and physical distance.** *Psychologische Forschung*, 1971, Vol. 34(3), 199-219.—Distance constancy was clearly defined with Thouless and Brunswik indexes by examining its previous definitions. The typical functions expressing the relationships between apparent distance and physical distance were derived from: (a) much available data obtained by many researchers, (b) Thouless and Brunswik indexes (formulas), and (c) Luneburg's theory. These derived functions were classified into Type I, II, and III according to their psychological significance. The validity of the classification was verified by experiments showing that the functions of Type III were available in poorly articulated spaces with a long viewing distance, i.e., on a housetop and a road, with the method of equal-appearing intervals. Moreover, the relationships between distance constancy and personal constants in Luneburg's theory were clarified.—*R. Gunter.*

8054. Maclean, Iain E. & Stacey, Barrie G. (U. Strathclyde, Glasgow, Scotland) **Judgment of angle size: An experimental appraisal.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 499-504.—Reports that previous work on the estimation of angle size suggests that 3 factors play a significant part in the forming of an accurate estimation: the size of the angle, its orientation, and the mode in which the response is made. The judgments by 60 adult Ss of 12 angles under varied conditions of orientation, response mode, and cue were examined. Results confirm the importance of size and orientation. Despite an overall significant difference in estimation between response modes, there was no indication of a consistent effect across angles for the different modes. Predictions on the influence of orientation made by G. Fisher (see PA, Vol. 44:4401) and K. Beery (see PA, Vol. 42:9782) were tested. While the former investigator was adequately supported, the latter was held to have reported results on a limited sample of angles which do not generalize to a wider range of angles.—*Journal abstract.*

8055. Winters, John J. & Spitz, Herman H. (E. R.

Johnstone Training & Research Center, Bordentown, N.J.) **The effects of visual acuity and instructions on two-dimensional size constancy.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 195-196.—Tested the 2-dimensional size constancy of 24 aged Ss (median age, 71 yr.) under conditions of corrected and uncorrected vision and with either apparent- or objective-size instructions. Size constancy was significantly above chance when vision was corrected but not when vision was uncorrected. There was no effect of instructions. Acuity was positively correlated with size constancy under both corrected and uncorrected conditions.—*Journal abstract.*

Color Vision

Form & Pattern Discrimination

8056. Craig, Eugene A. (Massachusetts Coll. of Optometry) **Exposure time and the perception of complex forms.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Nov), Vol. 47(11), 887-891.—Exposed pseudorandom forms, differing in number of sides from 6-24, for time durations from .01-15 sec. Span of apprehension remained constant over the range from .04-1 sec. Ss were 63 undergraduates tested in 4 groups. Results indicate that number of sides reported was consistent with the hypothesis that apparent complexity increases as exposure time increases up to the limit set by the stimulus situation. Percentage discrepancy between number of sides presented and number of sides reported increased: (a) as number of sides presented increased, and (b) as exposure time decreased.—*P. McMillan.*

8057. Long, Nigel R. (U. Queensland, Brisbane, Australia) **The effect of visual masking on the critical duration of form.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 193-194.—8 Ss were briefly shown pairs of letters under various conditions of simultaneous masking. For the simultaneous masking conditions, a single homogeneous flash of light (MS), 1 msec. in duration, followed the onset of the letters (TS) at varying onset asynchronies. The recognition of the TS letters was found to be an increasing function of the MS onset delay. Current theories of form perception and visual masking are examined in the light of this finding.—*Journal abstract.*

8058. Merikle, Philip M., Coltheart, Max, & Lowe, Douglas G. (U. Waterloo, Ontario, Canada) **On the selective effects of a patterned masking stimulus.** *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 264-279.—Investigated previous findings which suggest that a patterned masking stimulus, presented immediately following tachistoscopic presentation of letter rows, produces large decrements in the recall of letters from the central positions in the rows but has little effect on recall from either end of the displays. 4 experiments with 92 undergraduate Ss confirm the existence of a selective masking effect. The effect was obtained following exposure durations which varied from 30-200 msec. and with both full- and partial-report techniques. Also the selective masking effect was limited to multi-letter displays in that it was shown that single letters were masked equally well across the positions used for an entire row. Results suggest that both ends of multi-letter displays are processed and identified before the center positions of the displays are processed. (French summary) (15 ref.)—*Journal abstract.*

8060. Shepard, Roger N. & Metzler, Jacqueline. (Stanford U.) **Mental rotation of three-dimensional objects.** *Science*, 1971(Feb), Vol. 171(3972), 701-703. — In an experiment with 8 adult Ss, it was found that the time required to recognize that 2 perspective drawings portray objects of the same 3-dimensional shape is (a) a linearly increasing function of the angular difference in the portrayed orientations of the 2 objects, and (b) no shorter for differences corresponding simply to a rigid rotation of 1 of the 2-dimensional drawings in its own picture plane than for differences corresponding to a rotation of the 3-dimensional object in depth. *Journal abstract.*

8061 Stockwell, C. W. & Guedry, F. E. (U S Naval Aerospace Medical Inst., Pensacola Fla.) **The effect of semicircular canal stimulation during tilting on the subsequent perception of the visual vertical.** *Acta Oto-Laryngologica*, 1970(Sep), Vol. 70(3), 170-175. When a man is accelerated on a centrifuge, the direction of gravito-inertial vertical changes relative to his body. However, a lag occurs in his perception of this change. The hypothesis has been advanced that the perceptual lag in this situation is partly the result of a conflict between signals arising from the semicircular canals and from the otolith organs. To test this hypothesis, 18 young male Ss were tilted in such a way that they received consistent semicircular canal and otolith signals. This was accomplished simply by tilting them 30° from upright in their frontal plane. Immediately after being tilted, Ss made estimates of the vertical which were approximately accurate, and continued to make accurate estimates throughout a 140-sec judgment period. The absence of a perceptual lag under these circumstances supports the hypothesis. (German summary) *Journal abstract.*

8062. Uttal, William R. (U Michigan) **The effect of interval and number on masking with dot bursts.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 469-473. — Reports that bursts of dotted visual noise can interfere with the recognition of dotted alphabetic characters during the period following the presentation of the character. The magnitude of this interference is considered to be a function of both the number of dots and the interval between the character and the visual noise burst. This interaction was explored in 2 experiments with 2 Ss. On the basis of results obtained, an attempt is made to clarify current notions of the period of interaction surrounding real time visual events. (24 ref.) *Journal abstract.*

8063. White, Murray J. (Victoria U., Wellington, New Zealand) **Brain function and the enumeration of visual stimuli.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 73-76. — Exposed arrangements of English and Greek letters and geometrical forms, varying in number from 4-8 elements, for 100 msec separately in the left and right visual hemifields. 7 undergraduates estimated the number of stimulus elements shown on each trial. Arrangements of English letters were better enumerated when shown in the right than in the left hemifield while arrangements of Greek letters and forms were enumerated equally well in both hemifields. *Journal abstract.*

8064. White, Murray J. (Victoria U., Wellington, New

Zealand) **Visual hemifield differences in the perception of letters and contour orientation.** *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 207-212. — In Exp. I, 10 students were required to recognize capital English letters presented 3° to the left or to the right of a fixation point. In Exp. II, 8 Ss were required to discriminate the orientation of a line presented in either the left or the right visual hemifield. In both experiments Ss displayed a significant right visual hemifield superiority and a marked positive correlation was observed in the hemifield differences between the 2 recognition tasks. Results suggest that for certain classes of stimuli visual laterality differences may be subserved by a selective contour coding mechanism. (French summary) (15 ref.) *Journal abstract.*

Eye Movement

8065 Smith, Karl U., Schmidt, Jack, & Putz, Vernon. (U Wisconsin) **Binocular coordination: Feedback of synchronization of eye movements for space perception.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Sep), Vol. 47(9), 679-689. — Measured time differences between the 2 eyes in paired pursuit and saccadic movements in 6 Ss by laboratory computer methods under variable conditions of visual perception. In keeping with assumptions of a neuronic feedback view, significant time differences were found between both paired binocular pursuit (35-50 msec) and paired binocular saccadic movements (1-5 msec). The direction of these time lags varied with conditions and direction of vision, although the magnitudes of the time differences were not increased. Results indicate that the eyes are not exactly conjugate in binocular space perception, as claimed in Helmholtz's classical theory, but depend on variable feedback timing and synchronization for their control. The real-time computer methods devised create many possible new lines of studying synchronism and coordination of both ocular and other types of body movements and physiological functions on a systems basis. *Journal abstract.*

8066 Smith, Karl U., Schremser, Robert, & Putz, Vernon. (U Wisconsin, Behavioral Cybernetics Lab.) **Binocular coordination in reading.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 251-258. — Measured the differences in time between the 2 eyes, using laboratory real-time computer methods to detect and measure the time between velocity peaks of binocular saccadic movements in reading. The hypothesis was that instead of being completely conjugate as indicated by prior methods of ocular measurement, the eyes must be coordinated in directional motion by small time differences that govern their feedback guidance and relative velocity. Results with 3 Ss indicate that the time differences between the eyes clustered around 3 values: (a) near synchrony, including no difference and left eye leading by 1 msec; (b) left eye leading by 7-9 msec; and (c) left eye leading by 14 msec. These time differences were not related to the difficulty of the reading material, but were changed significantly by 15° horizontal rotation of the reading display. Results change the established views that the eyes are perfectly conjugate in saccadic motion and provide initial suggestive data toward a dynamic feedback doctrine of coordinate eye motion and functional disabilities in visual perception. *Journal abstract.*

Brightness & Contrast Discrimination

8067. Lie, Ivar. (U. Oslo, Inst. of Psychology, Norway) **Psychophysical invariants of achromatic colour vision: V. Brightness as a function of inducing field luminance.** *Scandinavian Journal of Psychology*, 1971, Vol. 12(1), 61-64.—Investigated the brightness (the dim-bright dimension) of achromatic color as a function of surrounding field luminance. Results with 4 Ss indicate that brightness of a test area was relatively independent of luminance level of the surrounding area until the luminance of the latter had passed well beyond that of the test area. With further increase of surrounding luminance, the brightness of the test area increased rapidly.—*Journal abstract.*

8068. McCann, John J., Land, Edwin H., & Tatnall, Samuel M. (Polaroid Corp., Cambridge, Mass.) **A technique for comparing human visual responses with a mathematical model for lightness.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Nov), Vol. 47(11), 845-855.—Determined human visual responses by having 10 Os compare the lightnesses in a test display with those in a standard display. The mathematical model's predictions were made by processing numbers that were identical to the luminances in the test display. These predictions were then scaled relative to the same standard lightness display used by the human Os. Methods of analyzing the results are discussed, as well as a variety of situations that can be used to establish whether a particular model can be considered a general model for lightness.—*Journal abstract.*

AUDITION

8069. Auerbach, Carl. (Yeshiva U.) **Improvement of frequency discrimination with practice: An attentional model.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 316-335.—Postulates that discrimination improves because Ss learn to actively attend to the pitch dimension, and consequently experience potentially experienceable small pitch differences, which were not experienced at the start of training. Ss given feedback learn to attend to the pitch dimension because it provides information correlated with the E's feedback. Ss not given feedback learn to attend to the pitch dimension because it provides its own "intrinsic" feedback. The model is consistent with the major facts concerning improvement of discrimination with practice, and makes quantitative predictions which are roughly correct.—*Journal abstract.*

8070. Doehring, Donald G. (McGill U., Montreal, Quebec, Canada) **Discrimination of simultaneous and successive pure tones by musical and nonmusical subjects.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 209-210.—Pairs of sounds, whose components were 2 pure tones presented simultaneously or successively, were discriminated by 8 music and 8 nonmusic students under same-different, matching-to-sample, and ABX modes of judgment. In contrast to the results of a previous study involving complex piano notes as components, there was no significant difference in the accuracy of discriminating simultaneous-simultaneous and successive-successive pairs or in the discrimination of simultaneous-successive and successive-simultaneous pairs.—*Journal abstract.*

8071. Schulman, Arthur I. (U. Virginia) **Detectability of the deletion of a tone from a tone-plus-noise background.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 496-498.—Reports that the deletion of a 1,000-Hz tone from a tone-plus-noise background is much harder for humans to detect than the insertion of the same tone into a background of noise. A mathematically ideal O, oblivious to the context in which an observation interval occurs, performs equally well under conditions of insertion and deletion. 52 undergraduates, not oblivious to context, produced the function $d' = .036 E/N_s$ under deletion; the slope of this linear function is no more than $1/2$ that of the typical slope of the comparable insertion function. The underlying reasons for the superiority of detection of insertion to that of deletion remain unclear.—*Journal abstract.*

Perception

8073. Harris, J. Donald & Sergeant, Russell L. **Sensory behavior of naval personnel: Monaural/binaural minimum audible angle of auditory response.** *U.S. Naval Submarine Medical Center Report*, 1970(Jan), No. 607, 1-17.—Considers what 1 ear contributes to man's perception of his auditory world and evaluates the monaural/binaural role in spatial orientation. Minimum audible angles were determined for monaural listening to moving sounds, and results were compared to similarly obtained binaural data. Ss were 3 experienced male adults with normal hearing. Much usable directionality existed for the monaural mode even at poor azimuths, and for both modes of listening the accuracy of response depended upon type of acoustical signal used. Findings are related to a review of facts and theories of sound localization by man. (41 ref.)—*Journal abstract.*

8074. Pearsons, Karl S. & Bennett, Ricarda L. (Bolt Beranek & Newman Inc., Canoga Park, Calif.) **Effects of temporal and spectral combinations on the judged noisiness of aircraft sounds.** *Journal of the Acoustical Society of America*, 1971(Apr), Vol. 49(4, Pt. 1), 1076-1082.—Determined the effects on perceived noisiness of spectral and temporal combinations of stimuli at varying durations in an anechoic chamber. Ss were 20 undergraduates. Several recordings of turbo-prop, turbofan, turbojet, and helicopter flyovers were also included in the list of stimuli. Results indicate that the most accurate predictor of the judged noisiness was perceived noise level with tone and duration corrections as outlined by the 1968 Federal Aviation Administration (FAA) aircraft certification procedure. To illustrate the responsiveness of effective perceived noise level (EPNL) over perceived noise level (PNL) in predicting the noisiness of stimuli, the results of the duration test reveal that, at judged equal noisiness, 75% of the data were within 4 db. of the standard signal for EPNL with the FAA and integrated duration measure as compared to 11 db. for PNL.—*Journal abstract.*

CHEMICAL SENSES

8076. Arabic, Phipps & Moskowitz, Howard R. (Stanford U.). **The effects of viscosity upon perceived sweetness.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 410-412.—Presented 6 concentrations of sucrose and 6 concentrations of sodium saccharin as stimuli to 30 undergraduate and graduate students. The concentrations were equally spaced logarithmically, covering a 32:1 range for each solute. The 12 aqueous solutions were presented at 4 levels of viscosity, ranging approximately from 1-10,000 centipoises, with sodium carboxymethylcellulose (cellulose gum) as the thickening agent. Magnitude estimates indicate that perceived sweetness decreases with viscosity. In log-log coordinates the viscosity-sweetness relation is roughly linear with a negative slope, suggesting that sweetness of both sodium saccharin and sucrose varies as a power function of viscosity, with an exponent between -20 and -25 (15 ref.).—*Journal abstract*.

8077. Berglund, B., Berglund, U., Engen, T., & Lindvall, T. (U. Stockholm, Sweden). **The effect of adaptation on odor detection.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 435-438.—Studied the sensitivity of 2 20-yr-old female undergraduates to a weak odor (hydrogen sulphide), following prior exposure to it varying in duration and concentration, with a yes-no detection method and a specially designed olfactometer. The effect of adaptation was demonstrated: the proportion of hits was lower the higher the concentration of the adaptation stimulus, when the response criterion, as measured by the proportion of false alarms, was fairly constant. The proportion of hits was apparently independent of the duration of the exposure to the adaptation concentration. This finding suggests that the sense of smell is more stable than is usually believed. The importance of considering adaptation in contemporary detection theory is discussed.—*Journal abstract*.

8078. Cain, William S. (John B. Pierce Foundation Lab., New Haven, Conn.). **Physicochemical characteristics and supraliminal odor intensity: Reply to Mitchell.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 478-479.—Comments on M. Mitchell's (see PA, Vol. 46:Issue 5) criticisms of previous work by W. Cain. The rate of growth (exponent) of the psychophysical function for odor intensity is considered to depend upon the physicochemical properties of odorous substances. Although no single property is able to predict rate of growth, a model developed by J. Dravnieks and P. Laffort that combines 3 basic properties has been quite successful. The results of intra-O comparisons of the relative exponents for various odorants have withstood the test of replication, i.e., variation among Os has usually not been a serious problem. It is concluded that in the future, comparisons of the exponents obtained from 1 laboratory to another would be aided considerably by inclusion of a standard odorant in all scaling studies. (19 ref.)—*Journal abstract*.

8079. Henion, Karl E. (U. Texas). **Olfactory intensity of diluted n-aliphatic alcohols.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 213-214. Constructed psychophysical scales from magnitude estimates of 90 undergraduate Os who judged the olfactory intensity of

stimulus concentrations of a typical geometric dilution series prepared for each of 9 alcohols in the homologous series C₁-C₁₀. The scales, which resembled power functions with exponents from .027-.359, had slopes that varied inversely with carbon chain length throughout the series except for pentanol, which was out of its ordinal place in the series by 1 step. Results confirm the widely held assumption of an inverse relationship.—*Journal abstract*.

8080. Mitchell, M. J. (U. Canterbury, Christchurch, New Zealand). **Olfactory power law exponents and water solubility of odorants: A comment on Cain's (1969) study.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 477.—Reports on studies which do not support the findings of W. Cain (see PA, Vol. 44:4433) on the increase in olfactory power law exponents with water solubility. It is concluded that Cain's findings are the coincidental product of attempts to generalize from a small number of odorants.—S. Knapp.

SOMESTHESIA

8081. Gescheider, George A., Wright, John H., & Polak, John W. (Hamilton Coll.). **Detection of vibrotactile signals differing in probability of occurrence.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 253-260.—2 male undergraduates were required to report the presence or absence of brief 60-Hz vibrotactile signals applied to the index fingertip. The probability of signal occurrence was .74 in every session, but the relative frequency of occurrence of weak and strong signals was different in different sessions. When weak signals were presented more frequently than strong signals the proportion of signal-present decisions was higher than when strong signals were presented more frequently than weak signals. Analysis of the false-alarm and hit rates indicated that the effects of this variable on detection performance were attributable to a shift in the location of S's judgment criterion rather than to changes in signal detectability.—*Journal summary*.

8082. Guedry, Fred E., Stockwell, Charles W., & Gilson, Richard D. **A comparison of subjective responses to semicircular canal stimulation produced by rotation about two axes.** *USN AMI Army-Navy Joint Report*, 1970(May), No. 1106, 13 p.—Describes a practical procedure for obtaining reliable measures of sensation associated with semicircular canal stimulation. Theoretically these measures can be used along with measures of nystagmus to estimate several vestibular response system parameters relevant in the clinical assessment of pilot vertigo. Responses produced by stimulation of the horizontal semicircular canals are compared with those produced by stimulation of the vertical canals. Group mean estimates of subjective angular displacement obtained from 40 naval flight students were approximately accurate for stimulation of both horizontal and vertical canals. Significant individual differences were found. From the responses obtained, mean estimates of vestibular system parameters were calculated. The theoretical basis of the method is discussed (19 ref.)—*Journal abstract*.

8083. Hazlewood, Valerie. (Macquarie U., North Ryde, New South Wales, Australia). **A note on failure to find a tactile motion aftereffect.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 59-62.—Considered earlier and disagreeing reports on the occurrence of a

tactile movement aftereffect following protracted stimulation of the skin by a moving object. A series of preliminary experiments with 50 Ss and 2 main experiments with 80 Ss failed to confirm the occurrence of an aftereffect. In the main experiments only 1 S reported an aftereffect after cessation of real movement and it was in the unexpected direction.—*Journal abstract.*

8084. Murray, John B. (St. John's U., Jamaica, N.Y.) **Psychology of the pain experience.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 193-206.—Research on the "placebo effect" has underscored the cognitive and affective aspects of pain; the meaning attributed to the pain experience, age, and ethnic background of Ss as well as suggestion, hypnosis, and audioanalgesia were some of the factors found to be relevant to the interpretation of the pain experience. (52 ref.)—*Author abstract.*

8085. Nikoloski, Tome. **Umor i osetljivost za dodir.** [Effect of fatigue on touch sensitivity.] *Psihologija*, 1969-1970(Oct), Vol. 3(1), 123-126.—Examined the effect of fatigue on touch sensitivity. Different levels of fatigue were used; touch sensitivity was expressed by the 2-point threshold. The F obtained was statistically significant at the .05 level. The hypothesis according to which fatigue reduces touch sensitivity was confirmed. As fatigue grows, touch sensitivity diminishes. When fatigue reaches a certain level, the reduction of touch spots themselves and of their density is further discussed. A very high level of fatigue is necessary in order to effect a further reduction of touch sensitivity. (Russian summary)—*English summary.*

8086. Nyborg, Helmut. (U. Aarhus, Inst. of Psychology, Denmark) **Tactile stimulation and perception of the vertical: I. Effects of diffuse vs. specific tactile stimulation.** *Scandinavian Journal of Psychology*, 1971, Vol. 12(1), 1-13.—Studied the responses of 24 female and 24 male mental hospital nurses on the Rod and Frame Test while supported in a tilting apparatus. Ss were assigned to 6 groups which were exposed to specific body, rod, and frame tilts. $\frac{1}{2}$ the groups were tested under diffuse body reference (DBR) conditions, and $\frac{1}{2}$ under specific body reference (SBR) conditions. Results indicate that tactile stimulation influenced the perception of verticality. Ss in the SBR condition scored closer to the physical vertical than Ss in the DBR condition. The tilting apparatus is described in detail. Individual differences on the test are noted. (19 ref.)—*S. Knapp.*

8087. Verrillo, Ronald T. & Chamberlain, Steven C. (U. Oxford, England) **Direct scaling of vibrotacton: An individual replication.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 225-226.—Retested a single S after an intervening period of 3 yr. using the method of numerical magnitude balance. The stimulus parameters were nearly identical in both experiments with a total of 15 Ss. The slope of the subjective magnitude function was the same at higher intensities. Near threshold, the curve was steeper, corresponding to results seen in the data of the 2 groups in which the individual served as an S.—*Journal abstract.*

ENVIRONMENTAL EFFECTS

8088. Congreve, G. R. (Addiction Research Foundation, Toronto, Ontario, Canada) **Dimensions of subjective response to short-term sensory deprivation.** *Psychonomic Science*, 1971(Feb), Vol. 22(4),

220-221.—Applied a semantic differential type of rating procedure to sensory deprivation by 26 male undergraduates who underwent 6 hr. of sensory restriction. Results of cluster analysis on a matrix of correlations between the 29 scales show that judgments of the unpleasantness of deprivation were quite highly related to judgments of its boringness, but that both these clusters were only slightly related to 2 clusters interpreted as measuring stress. Possible consequences of these data for the theoretical analysis of sensory deprivation are discussed.—*Journal abstract.*

SLEEP & FATIGUE & DREAMS

8089. Kramer, Milton; Whitman, Roy M., Baldrige, Bill J., & Ornstein, Paul H. (U. Cincinnati, Medical School) **Dream psychology and the new biology of dreaming.** Springfield, Ill.: Charles C Thomas, 1969. xxvi, 459 p. \$17.—Reports on a conference which focused both on the classical views of the dream and on the current attempts at exploring the content of dreams. Includes papers by several authors on theory and technique in dream psychology.

8090. Salzarulo, Piero. (U. Bologna, Inst. of Psychology, Italy) **Etude électroencéphalographique et polygraphique du sommeil d'après-midi chez le sujet normal.** [Electroencephalographic and polygraphic study of afternoon sleep in the normal subject.] *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 399-407.—Studied the spontaneous afternoon sleep of 12 normal Ss. On 2 consecutive afternoons, 6 EEG and 6 polygraphic derivations were made: 2 for eye movements, 1 for tone, 1 for respiration, 1 for EKG, and 1 for electrodermogram. It was found that: (a) $\frac{1}{2}$ the afternoons showed at least 1 phase of fast sleep; (b) afternoons with fast sleep showed a longer total sleep than those without it; (c) the presence of fast sleep was linked with a certain minimal length of slow sleep and was always preceded by deep slow sleep; (d) the average relationship between the duration of phasic periods and of total fast sleep was practically identical with that encountered during night sleep; (e) going to sleep was faster in the afternoon than at night and the periods with slow eye movements were more numerous; (f) there were variations in the respiratory rhythm during slow sleep and atonic periods, particularly during deep slow sleep; and (g) the recall of dream activities was possible even after sleep without REMs. (French summary) (17 ref.)—*English summary.*

HYPNOSIS & SUGGESTIBILITY

8091. Ruch, John C. & Morgan, Arlene H. (Stanford U.) **Subject posture and hypnotic susceptibility: A comparison of standing, sitting, and lying-down subjects.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Apr), Vol. 19(2), 100-108.—Inferred that in comparison to the customary sitting posture, a lying-down posture would facilitate hypnosis and a standing posture inhibit it. A preliminary experiment with 83 undergraduates, using a slightly modified, tape-recorded Stanford Hypnotic Susceptibility Scale, Form C, failed to support either hypothesis. A subsequent experiment under improved conditions with 20 undergraduates in each group (standing, sitting, and lying down) also showed no significant difference of

mean hypnotic susceptibility scores between any 2 of the conditions. Although Ss expressed dislike for the standing posture, the only objective disadvantage seemed to be some dizziness or nausea generated for some Ss (5 out of 39 tested in the standing condition). No clear evidence exists that this effect is to be attributed to hypnosis rather than to standing with eyes closed for an appreciable time. Results show that hypnotic behavior may be little affected by the concomitant requirements of maintaining a standing or sitting posture, even with the use of an induction which emphasizes relaxation. (Spanish & German summaries)—*Journal abstract*

8092 Sheehan, Peter W. (U. New England, Armidale, New South Wales, Australia) **A methodological analysis of the simulating technique.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Apr), Vol. 19(2), 83-99.—2 features characterize the simulating technique: simulators are both deeply involved in the problem task of simulation and immune to the experiential effects of hypnotic treatment. The technique leads to unambiguous inferences when hypnotic and simulating Ss perform in a similar fashion in the hypnotic setting. However, the treatment aspects of faking instruction limit the interpretation of behavioral differences between the 2 groups. Such effects can be demonstrated and are most likely to arise when the expected response is difficult for S to define. Personality differences between hypnotic and simulating Ss appear to be relatively unimportant. On some variables, at least, faking performance is not influenced as much by personality factors as by the treatment effects of simulation instruction. (Spanish & German summaries) (21 ref.)—*Journal abstract*.

8093 Spanos, Nicholas P. (Boston U.) **Goal-directed fantasy and the performance of hypnotic test suggestions.** *Psychiatry, Washington, D.C.*, 1971(Feb), Vol. 34(1), 86-96. Hypothesizes that hypnotic test suggestions lead Ss to certain goal-directed fantasies. Ss were 24 female student nurses who had taken the Harvard Group Scale of Hypnotic Susceptibility. They performed suggested tasks while under hypnosis and then described their thoughts while performing the task. Ss who successfully performed the tasks were found to be using "goal-directed fantasy," i.e., they constructed imaginary situations in which the task became reasonable. Findings are tentative and further tests are suggested. E. M. Uphrard.

MOTIVATION & EMOTION

8094. Berlyne, D. E. & Boudewijns, W. J. (U. Toronto, Ontario, Canada) **Hedonic effects of uniformity in variety.** *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 195-206.—Describes 2 experiments with a total of 148 undergraduates, using visual patterns consisting of 2 elements that differed in 0-4 properties but were otherwise alike. Different Ss rated the patterns for pleasingness, interestingness, liking, and complexity. With successive, but not with simultaneous, presentation of elements, pleasingness and liking reached maxima when there were both differences and similarities. Interestingness increased with the number of differences in both modes of presentation. Judged complexity increased with the number of differences but was significantly higher when elements appeared simultaneously. It is suggested that when hedonic ratings are plotted against judged complexity, results can be related

to findings of previous experiments on hedonic effects of complexity. (French summary) (20 ref.)—*Journal abstract*

8095 Bowers, Kenneth S. (U. Waterloo, Ontario, Canada) **Heart rate and GSR concomitants of vigilance and arousal.** *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 175-184. In an experiment with 16 male undergraduates, Ss receiving high shock were considerably more autonomically aroused than low shock Ss, as indicated both by an index of GSR, and by heart rate uncorrected for base level. When corrected, heart rate did not differentiate between Ss receiving high and low level shock. In a within Ss comparison, however, UCS temporal uncertainty generated lower corrected heart rate than UCS-certainty, and did so independently of shock level. It is unlikely that UCS-uncertainty was less anxiety arousing than UCS-certainty; indeed, GSR data suggest the contrary. The decrease in heart rate during UCS uncertainty trials is presumed to be a function of Ss' increased vigilance for uncertainty removing cues. The cognitive orientation toward environmental intake which such vigilance implies should, according to J. I. Lacey, be accompanied by cardiac deceleration. It is argued that such cognitive aspects of cardiac functioning are superimposed over gross cardiac responsiveness to autonomic arousal. (French summary)—*Journal abstract*.

8096 Boyle, D. G., Giles, Howard, & Oxford, Geoffrey S. (U. Aberdeen, Scotland) **Comments on the theory of laughter by Giles and Oxford: Laughter: A reply.** *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 317-320. The author enumerates 11 points of disagreement between his theory of laughter and that of H. Giles and G. S. Oxford (see PA, Vol. 44:18600). The 11 points are responded to in the reply by Giles and Oxford that follows.—J. S. Sexton.

Toronto, Ontario, Canada) **Failures of information to reduce rated aversiveness of unmodifiable shock.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 85-94.—Conducted 2 experiments with male and female undergraduates in which information about shock onset was varied between groups. In Exp. I, with 3 groups of 30 Ss, shocks were (a) predictable by temporal signaling (Condition 1: constant 20-sec intershock interval); (b) unpredictable (Condition 2: intershock intervals varied from 10-30 sec); and (c) predictable by conventional signaling (Condition 3: tone or light preceding each irregularly presented shock by 5 sec.). A form of probe-stimulus (PS) technique was used to obtain independent measures of fear. Rated aversiveness of shocks did not vary as a function of information. There was, however, reliable evidence for the presence of conventionally-signaled conditional fear under Condition 3. In Exp. II, to avoid a possible source of confounding, the PS technique was not used. Conditions 1 and 2 were readministered to 2 30-S groups. Information again failed to reduce the rated aversiveness of temporally signaled shocks. The 2 concomitant, shock-elicited, autonomic measures, GSR and digital volume

pulse change, failed to show a differential rate of decline as a function of information (Condition 1 vs. 2), although both measures declined reliably over trials.—*Journal abstract.*

8101. Karsh, Robert; Monty, Richard A., & Taub, Harvey A. **Effects of knowledge of results and method of payoff on keeping-track performance.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Jun), No. 15-70, 9 p.—Utilized knowledge of results and financial incentives having "motivational" as opposed to "directive" properties to further examine the "spatial window" model of keeping-track performance. It was found that when Ss are required to keep track of 4 categories of information at once they will normally optimize performance with 2 of these categories. If incentives are provided which call for optimal performance with all 4 categories, overall performance deteriorates. Implications for the spatial window model are discussed.—*Journal abstract.*

8102. Suedfeld, Peter; Landon, P. Bruce; Epstein, Yakov M., & Pargament, Richard. (Rutgers State U.) **The role of experimenter and subject expectations in sensory deprivation.** *Representative Research in Social Psychology*, 1971(Jan), Vol. 2(1), 21-27.—Each of 5 graduate student Es ran 18 undergraduate Ss (chosen on the basis of a battery of personality tests) through 30 min. of sensory deprivation. Ss were then given the Subjective Stress Scale and the Symptom Checklist developed by P. Suedfeld. For 6 Ss, E expected the procedure to have adverse effects; for 6 others, positive effects; and for the others, no expectation was induced. Ss also had aversive, positive, or no set. S expectation affected subjective stress ratings after release, but not cognitive efficiency; neither E expectation nor the interaction had significant effects. It appears that sensory deprivation is a situation in which E effects are unimportant compared to S factors. (16 ref.)—*Journal abstract.*

8103. Thackray, Richard I. & Touchstone, R. Mark. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) **Recovery of motor performance following startle.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 279-292.—Studied the extent to which startle disrupts motor performance, rate of recovery, and characteristics of Ss who differ in susceptibility to startle. 30 paid male college students were trained on both RT and tracking tasks. Continuous recordings were taken of heart rate and skin conductance. During a subsequent period of continuous tracking, "startle" stimuli (115-db random noise) were unexpectedly presented. Results show the recovery of tracking performance following startle to be quite rapid; performance returned to prestimulus levels within 15 sec. following stimulation. Contrary to several previous studies, RTs to the startle stimuli decreased relative to nonstartle RTs. Ss with the greatest increase in tracking error following startle were least proficient prior to startle. There was also an indication that these Ss reacted more strongly to startle, in terms of both their subjective response and heart-rate acceleration, than those Ss whose tracking was least impaired by startle. An apparent covariation between recovery curves for heart rate and tracking error was found following startle. (21 ref.)—*Journal abstract.*

8104. Voicu, C. (Academy of Social & Political Sciences, Bucharest, Romania) **Influence of the level of bioelectrical arousal on the mnemonic efficiency of verbal and non-verbal stimuli.** *Revue Roumaine des Sciences Sociales-Série de Psychologie*, 1970, Vol. 14(2), 151-162.—To test whether short-term memory is better for material learned under arousal conditions, series of words, images, and words and images combined were presented for 2 sec. at 30-sec intervals, 1/2 being accompanied by a continuous 500-Hz sound. EEG levels and free recall of stimuli were recorded for 21 male, young adult Ss. Arousal was found to impair short-term memory, an effect most marked for the recall of images. Facilitating effects of arousal were found only with Ss of low EEG reactivity levels. (28 ref.)—*C. Mayo.*

ATTENTION & EXPECTANCY & SET

8105. Alden, David G., Wedell, Jacelyn R., & Kanarick, Arnold F. (Honeywell, Inc., Systems & Research Center, Minneapolis, Minn.) **Redundant stimulus coding and keeping-track performance.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 201-202. Investigated the effect of redundant color coding on keeping-track performance, using symbols as the primary cue. 32 undergraduates were assigned to 1 of 4 coding conditions: symbol color, color symbol, symbol only, or color only. Performance was measured on a task requiring S to monitor 8 information channels, which were being updated randomly. Results indicate that the addition of a redundant color code did not yield a significant improvement in performance, as compared to performance on the component codes (i.e., the symbol only and color only groups). *Journal abstract.*

8106. Alexander, C. Norman; Zucker, Lynne G., & Brody, Charles L. (Stanford U.) **Experimental expectations and autokinetic experiences: Consistency theories and judgmental convergence.** *Sociometry*, 1970(Mar), Vol. 33(1), 108-122. Describes 2 experiments with 40 female undergraduates that attempted preexposure disabusal of Ss' implicit expectations of systematic and regular light movements. In Exp. I, 20 Ss were informed about the autokinetic "illusion," the movements were dissociated from the E's control, and erratic perceptions were legitimated. No convergence was found over 60 trials either with Ss responding alone or with 2 Ss simultaneously reporting their judgments. Pairs in the together condition showed no trend toward consensual perception of movement. Results are contrary to M. Sherif's original result and its many replications. In Exp. II, 20 Ss "overheard" a stooge responding to a stimulus light they could not see, thus providing them with an expectation about the nature of the light movements they subsequently judged. Ss overhearing a convergent stooge rapidly converged, while Ss overhearing divergent stooges did not. Ss in the divergent condition were more positive about the experimental situation than convergent Ss. Implications for consistency theories are discussed. (21 ref.) *Journal abstract.*

8107. Cavanagh, J. Patrick & Chase, William G. (Carnegie-Mellon U.) **The equivalence of target and nontarget processing in visual search.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 493-495.—Compared the performances of a total of 32 Ss on a forced-choice visual search task and an item recognition task. Results do not support U. Neisser's hypothesis of a

preattentive stage that processes targets and nontargets differentially. In the forced-choice condition Ss indicated which of 2 items in a visual display was a target. In item recognition, Ss determined whether or not the single item in the visual display was a target. The size of the memorized set of possible targets was varied from 1-6 items for both tasks. Latencies increased linearly with memory set size in both conditions, the slopes for forced choice and item recognition were 418 and 270 msec/item, respectively. The ratio of 1.38 between the 2 slopes was well fit by S. Sternberg's item recognition model, which predicts a ratio of 1.50. Results support the hypothesis that the identification or "standing out" of targets, as compared to "blurred" nontargets, in visual search occurs after both the encoding and memory search processes have terminated. *Journal abstract.*

8108 Grasha, Anthony F. **Detection theory and memory processes: Are they compatible?** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 123-135. Recent retention research has applied the concepts of the Tanner and Swets signal detection model to recognition and recall measures. While the literature is not extensive, the evidence tentatively suggests that d' and criterion changes are potentially useful descriptive constructs. Several methodological problems were noted in the literature reviewed. Specifically, comparative analyses of the data are difficult since different detection procedures were employed to estimate d' and criterion changes as a function of the same retention variables. In addition, an empirical relationship needs to be established between memory system output, e.g., response strength, familiarity, etc., and the rating scale values which are fundamental to a retention detection analysis. Finally, a clear framework is needed for d' and criterion changes in memory. (31 ref.) *Journal abstract.*

8109 Hiles, D. R., Bulger, P. M., & Lowe, G. (U. Hull, England) **Effect of short presentation times on intuitive estimation of means.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 136. Extends the range of presentation time to include .2, .5, 1, 2, 4, and 6 sec., using arrays of 20 2-digit numbers randomly arranged in a 5×4 matrix. Ss were 17 undergraduates whose responses were categorized as accurate, overestimates, or underestimates. It was found that the variability of Ss' estimates was reduced as presentation time increased, suggesting that with shorter presentation times Ss were only able to perceive (and/or process) relatively smaller and less representative samples from the full array. —P. Hertzberg

8110 Ilgen, Daniel R. (U. Illinois) **Satisfaction with performance as a function of the initial level of expected performance and the deviation from expectations.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 345-361. Established 3 levels of expected performance by reporting performance independent of actual performance. Ss were 225 male undergraduates. When performance expectations had been established, performance feedback was varied from the expected levels. These variations in percentiles were: -20, -10, 0, +10, and +20. Satisfaction with performance was a monotonic function of the algebraic difference between expected performance and reported performance at all 3 performance levels. However, satisfaction was also a function of the level of performance as well as the interaction between level of performance and deviations from expected performance. It is concluded that measures of both the amount of a

particular stimulus object and the degree to which this amount differs from what is expected should be used to predict satisfaction. (27 ref.) *Journal abstract.*

8111 McFarland, Barry P. & Halcomb, Charles G. (Texas Technological Coll.) **Expectancy and stimulus generalization in vigilance.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 147-151. Examined the influence of signal probability during an auditory pretest on performance on a visual monitoring task in a split-plot factorial analysis of variance. 52 male undergraduates were given an auditory pretest in which white noise was intermittently terminated at either a high ($p = .18$) or low ($p = .02$) probability during any 2-sec interval; then a visual monitoring task was performed in which the signal probability was either high ($p = .18$) or low ($p = .02$). Ss who received the high auditory pretest performed reliably better than the low group ($p < .01$). The within-session decrement varied as a function of the different pretest and task signal probabilities. Results support the expectancy theory of vigilance and suggest the importance of the role of pretask adaptation in the vigilance paradigm. *Journal abstract.*

8112 Olshavsky, Richard W. (Georgia Inst. of Technology) **Search limits as a function of tree size and storage requirements.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 336-344. Estimated the practical limits of accurate search of complex tree structures, under conditions permitting no external memory aids. 25 undergraduates attempted exhaustive search of 19 problems whose underlying tree structures increased systematically with respect to breadth and depth. An additional group of 25 Ss solved the same problems under conditions of increased storage requirements. A very limited (2-3 chunks) fallible memory was implicated as a possible determiner of the direction and extent of the search process. —*Journal abstract.*

8113 Reitz, Willard E. (U. Western Ontario, London, Canada) **Personal reinforcement and awareness.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 243-245. —50 student nurses were administered a visual discrimination task for which reinforcements were statements from the Allport-Vernon-Lindzey Study of Values. Positive and negative reinforcers were chosen to be high in valency (± 2 standard deviations; SDs) or low (± 1 SD). Awareness of reinforcement contingency was greater ($p < .001$) under high-valency conditions than under low. The high-valency condition also resulted in higher performance and gains over trials. Results are interpreted as favoring a personal motive interpretation. —*Journal abstract.*

MOTOR PERFORMANCE

8115 Carlson, B. Robert. (U. Kansas) **Isotonic strength and relative isotonic endurance.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 247-252. —No relationship was found between isotonic strength and relative isotonic endurance. Additional support was provided by the insignificant results in the analysis of endurance performance of 3 groups of 12 male undergraduates each based on strength level. Implications for the use of relative isotonic endurance tests in future

study of perseverance are discussed. (18 ref.)—*Journal abstract.*

8116. Jordan, Stephen. (U.S. Naval Training Device Center, Orlando, Fla.) **Rhythm in motor performance.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 122. —Reports 3 tasks in a study of rhythm in motor skill in which (a) 4 Ss demonstrated a fairly high degree of temporal regularity in drawing an equilateral triangle; (b) Ss tended to demonstrate the existence of an imposed rhythm which was nearly independent of the task structure when an isosceles triangular pattern was used; and (c) Ss were tested for the contribution of full awareness to the imposition of a rhythmical pattern on this type of tracking task. Although too few Ss were used for generalizations, it is concluded that the nature of rhythmical response in a simple motor task appears to be dependent on an S's set as well as task structure.—P. Hertzberg.

8117. May, Robert J. & Black, Roger W. (U. South Carolina) **Persistence of responding on a perceptual-motor task following shifts in informative feedback.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 233-234. —Trained 60 undergraduates in 4 groups on a pursuit-rotor task which they continued until they became bored or tired. After each trial 1 group was informed that their performance was good and a 2nd that theirs was poor. A 3rd group was initially rated good and then shifted to poor, while the 4th group was shifted from poor to good. Persistence in responding suggests a negative contrast effect following the shift from good to poor, but no corresponding positive contrast effect occurred. No effect on accuracy of performance was obtained. Results are analogous to those obtained in conditioning studies.—*Journal abstract.*

8118. Michel, F. (National Center for Scientific Research, Lab. of Psychophysiology, Lyon, France) **Etude expérimentale de la vitesse du geste graphique.** [Experimental study of handwriting speed.] *Neuropsychologia*, 1971(Mar), Vol. 9(1), 1-13. —Describes a new technique which allows the recording of the speed of a pen-tip in X and Y during normal handwriting. The basic mechanics of the movements involved in cursive script, particularly the relationship between graphic amplitude and speed (instantaneous and averaged), are elaborated. By integrating velocities, displacements in X and Y may be obtained, stored on magnetic tape, played back on a cathode ray oscilloscope or XY recorder, and fed to a computer. It is concluded that this technique (a) permits the quantitative analysis of handwriting as a function of time, (b) is a potential tool for the study of sensorimotor coordination in graphic movements, (c) will permit handwriting at a distance and after a time-delay, and (d) may serve to facilitate further advance in the synthesis of handwriting. (German summary) (20 ref.)—*English summary.*

REACTION TIME

8119. Brebner, J. (U. Adelaide, South Australia) **The refractoriness of regular responses.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 3-7. —Studied the "psychological refractory period" in the RT experiment with 17 17-40 yr. old males using 2 visual stimuli. Stimulus 1 was presented at the rate of 30/min followed by Stimulus 2 (S2) at intersignal intervals (ISIs) of 50-300 msec. Delays in responding to S2 were less than predicted on an expectancy model or from the

single-channel hypothesis when $ISI < RT_1$. A tentative explanation of the data is offered which does not conflict with the single-channel hypothesis.—*Journal abstract.*

8120. Green, David M. (U. California, San Diego) **Fourier analysis of reaction time data.** *Behavior Research Methods & Instrumentation*, 1971(May), Vol. 3(3), 121-125. —The popularity of the assumption of stages in models of the RT process and the availability of fast and efficient means of computing approximations to the Fourier transform makes the Fourier analysis of RT data attractive. Some problems associated with such analyses and convenient ways to overcome some of the difficulties are discussed.—*Journal abstract.*

8121. Hannes, Martin. (Herbert H. Lehman Coll., City U. New York) **The effect of right and wrong guesses on two-choice reaction time.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 241-252. —10 undergraduates were randomly assigned to each of 4 conditions: 20, 40, 60, and 80% repetitions. In all conditions RT associated with right guesses was faster. For repetition events, RT across conditions varied inversely with the objective probability of repetition occurrence (for right and wrong guesses, respectively); in contrast, RT was independent of condition for alternation events. A model to explain this latter finding is examined. It is proposed that RT under the conditions investigated reflects the additive effects of 2 independent preparatory mechanisms, 1 dependent on subjective probability, and the other on objective probability.—*Author abstract.*

8122. Jones, Thomas N. & Kirk, Roger E. **Monitoring performance on visual and auditory displays.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 235-238. —Compared the monitoring performance of Ss using a visual display with the performance of Ss using an auditory display. 24 male undergraduates were randomly assigned to monitor either the visual or the auditory display for a 3-hr period. 2 measures of performance, RT and probability of responding, were obtained during the monitoring session. Analysis of the results indicates that Ss who monitored the auditory display had shorter RTs, higher probability of responding, and less variability than Ss who monitored the visual display.—*Journal abstract.*

8123. Makarov, P. O. (Leningrad U., USSR) **Vremya reaktsii cheloveka na nachalo i konetz kratkogo zvuka razlichnoi sily, dlitel'nosti i pri dopolnitel'nom elektrokozhnom razdrazhenii.** [The reaction time to the beginning and cessation of a short sound of different strength, duration and during additional electrical skin stimulation in man.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1714-1720. —Investigated the functional relationship between human RT and an acoustical stimulation. Employing sound generators, Ss had to press a button to stop the stimulus as soon as he heard the sound, and the corresponding RT was measured on a special device. The variables were: (a) intensity (70-90 db.) above the threshold value, and (b) duration (2-100 msec.). Of the threshold values the RT was found to be 400-500 msec. With increase in intensity above the threshold the RT went down to 200 msec. After reaching a certain limiting value the RT started increasing again. A simultaneous electrocutaneous stimulation caused an increase in RT. The RT for the beginning of a stimulus was shorter than the latency period for the end of the same signal. Increase of the latency period with the addition of the simultaneous electrocutaneous stimulation is caused by the resulting

higher threshold value. It is suggested that the latency period is shorter at the beginning than at the end of the same acoustical signal as a result of the neurodynamic characteristics of S's functional state and the role played by the CNS mechanism.—*J. Halev.*

8124. **McKeever, Walter F., Huling, Maurice D., & Gazzaniga, Michael S.** (Ventura County Mental Health Dept., Calif.) **A note on Filbey and Gazzaniga's "Splitting the brain with reaction time."** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 222-223. Comments on the implication by R. A. Filbey and M. S. Gazzaniga (see PA, Vol. 44:6000) that their studies of transcallosal transmission time represents a new strategy conceivable only on the groundwork provided by the split-brain studies of Gazzaniga and Sperry. References are cited which suggest earlier studies of the same phenomenon. The criticism of McKeever and Huling is answered in a note by Gazzaniga. —*P. McMillan*

8125. **Salthouse, Timothy.** (U. Michigan, Human Performance Center) **Human performance as a function of future demands.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 327-336. Investigated the influence of increasing the requirements of a later RT task upon the performance of an earlier RT task in 2 experiments with 8 right-handed 18-22 yr old males and 4 right-handed 19-22 yr old males, respectively. Exp. I controlled the probability of the occurrence of the 2nd reaction signal and Exp. II manipulated the complexity of the 2nd task by introducing alternative distractor events to the reaction signal. Results of both experiments are interpreted as supporting a shared processing capacity theory of human performance in which the allocation of "preparation" or "concentration" is distributed in accordance with the demands of the component tasks. —*Journal abstract*

8126. **Schueneman, Arthur L., King, Hollis; Sandman, Curt A., & Deabler, Herdis L.** (Veterans Administration Hosp., New Orleans, La.) **Reaction time and temperament type.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 162. Examined the relation of a purely psychomotor task to the repression-sensitization (R-S) personality dimension described by D. Byrne. 106 randomly selected male patients were administered the embedded form of the R-S scale from the MMPI and a psychomotor task. Data indicate that psychomotor RT appears independent of the R-S personality dimension. —*P. Hertzberg*

8127. **Simon, J. Richard & Craft, John L.** (U. Iowa) **Communicating directional information with an auditory display.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 241-243. Examined whether right or left commands could be communicated more effectively using symbolic, directional, or combined directional and symbolic cues. In a choice RT task, 36 male and 36 female undergraduates pressed a right- or left-hand key in response to (a) 1,000 or 4,000 Hz. binaural tonal commands (symbolic cue), (b) a single pure monaural tone (directional cue), and (c) 1,000 or 4,000 Hz. monaural tonal commands in the ear corresponding to the symbolic content of the command (combined directional and symbolic cues). The combined (redundant) cue condition produced the fastest RT, while RT to the directional cue alone was faster than to the symbolic cue alone. —*Journal abstract.*

LEARNING

8128. **Fitzgerald, Donald & Hong, Huengim O.** (U. Alberta, Edmonton, Canada) **Leveling-sharpening and**

representational learning. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 211-214. Related performance of 96 female undergraduates on the Squares Test to immediate and delayed recognition of unfamiliar concept names in a representational learning task. Although previous research has not substantiated predictions from the assimilation model when the task involved associative learning, these results clearly indicate ($p < .01$) the superiority of "sharpeners" to "levelers" in representational learning with the stimulus phrases embedded in prose material and low-meaning response terms. —*Journal abstract.*

8129. **Gerst, Marvin S.** (U. California, Medical School, San Diego) **Symbolic coding processes in observational learning.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 19(1), 7-17. Tested the hypothesis that (a) symbolic coding of modeling stimuli enhances observational learning, and (b) different types of codes are differentially effective over time and with modeled responses varying in verbalizability. 72 male and female undergraduates observed a filmed model perform complex motor responses, each of which was described in concrete terms, reactivated imaginatively, or coded in the form of summary labels which encompassed essential elements. Imaginal and summary label code groups achieved higher matching scores than the concrete verbal description group which exceeded the control group. The form of memory code did not interact with verbalizability, but summary labeling was superior for retention. In the delayed test of behavioral reproduction, the labeling group was able to perform more modeled behavior than the other treatment groups, which did not differ from each other. The influence of symbolic representation on modeling was further revealed by evidence of a significant relationship between retention of summary codes and delayed reproduction of modeled responses. (20 ref.) —*Journal abstract.*

8130. **Houston, B. Kent.** (U. Kansas) **Noise, negative transfer, and meaningfulness.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 255-256. Conducted 2 studies with 32 and 48 Ss respectively, to test the hypothesis that the presence of noise, which Ss were instructed to ignore, would facilitate performance on a negative-transfer learning paradigm but not performance on a control learning paradigm. The effect of noise on 2 levels of item meaningfulness for each paradigm was also studied. In both experiments, negative transfer was successfully generated for low-meaningful items and the predicted interaction between learning paradigms and treatments was obtained. In neither experiment was significant negative transfer generated for high-meaningful items, and the predicted interaction between paradigms and treatments was not obtained. —*Journal abstract.*

8131. **MacRae, K. D. & Reid, J. B.** (Queen's U., Belfast, Ireland) **Asymmetric stimulus intensity in probability learning.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 228. Studied the prediction of whether 1 or both of 2 lights would occur over a series of 1,000 trials. 4 groups of 6 Ss each were run, in which 1 light illuminated on 20, 40, 60, or 80%, respectively, of the 1st 500 trials. In all groups, 1 light illuminated on 50% of the 2nd 500 trials. Results indicate a need for further studies of the levels of stimulus intensity at which changes in stimulus intensity are related, positively and negatively, to response preferences. No significant differences between the groups were found. —*P. Hertzberg.*

8132. **Stael von Holstein, Carl A.** (U. Stockholm,

Sweden) **The effect of learning on the assessment of subjective probability distributions.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 304-315.—14 Ss (students of business administration, emphasizing quantitative methods) assessed subjective probability distributions for unknown parameters of a Bernoulli process. The process was generated by random devices, e.g., oddly shaped dice. 1 group of Ss received feedback between sessions in the form of the true values of the parameters. These Ss improved their performance more than the 2nd group, and acquired more confidence in their assessments.—*Journal abstract.*

8133. Theios, John; Brelsford, John W., & Ryan, Phyllis. (U. Wisconsin) **Detection of change in non-stationary binary sequences.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 489-492.—Investigated the ability of 4 undergraduates to detect changes in the underlying probability structure of binary sequences of events. Ss were presented with sequences of 30 events (0s and 1s) which had been generated by 2 underlying probability values. P_1 was the probability of a 1 in the 1st integer (i) events, P_2 was the probability of a 1 in the last 30-i events, and the distribution of i was uniform from 1-29. Ss indicated, without feedback, where the transition point from P_1 to P_2 took place for 4 sets of problems in which P_1 and P_2 took on the following pairs of values: (.40, .60), (.20, .80), (.05, .60), and (.50, 1). Estimates by Ss were compared with true transition points, i, and with maximum likelihood estimates of 1. The difference between P_1 and P_2 and the closeness of at least 1 P value to the boundaries, either 0 or unity, interacted in determining the difficulty of the problem for Ss.—*Journal abstract.*

8134. Yelen, Donald R. (Washburn U.) **The effects of percent of association on discrimination shifts.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 253-254.—Investigated the effects of changes in the percent of association between stimuli and responses on intra- and extradimensional shift problems. Ss were 80 undergraduates. Results indicate that the percent of association differentially affected the frequency of responses and that the weighted frequencies of the responses were related to the choices made with stimulus compounds that stimulate intra- and extradimensional shift problems.—*Journal abstract.*

Conditioning

8135. Allen, Charles K. & Branum, Allen R. (U. Montana) **Differential eyelid conditioning as a function of the probability of reinforcement of the conditioned stimuli.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 251-252.—Investigated differential eyelid conditioning with different schedules of reinforcement of CS1 and CS2. The reinforcement schedules employed were 100-0%, 80-0%, 100-20%, and 80-20%. Significant differentiation occurred in all groups. With the reinforcement schedule to CS1 constant at 100%, increasing the reinforcement schedule from 0-20% resulted in a decrease in responding to CS1. With reinforcement schedule of CS2 constant at 0%, decreasing the reinforcement schedule of CS1 from 100-80% resulted in increased responding to CS2. A stimulus generalization interpretation is offered.—*Journal abstract.*

8136. Brooks, William H. (Oklahoma State U.) **The role of cognitive variables in an extinction situation.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5192.

8137. Hayashi, Takashi. **An experimental study of the second-signaling systems of man through the printed language.** *Conditional Reflex*, 1971(Jan), Vol. 6(1), 11-21.—Earlier findings indicated that not only the sight of a "pickled plum" increased the resting saliva of Japanese adults, but the spoken words "pickled plum" also increased the amount of saliva as a natural conditional reflex. It was also found that the reflex was stronger when an oral interpretation of the words "pickled plum" was added to their mere phonation. It was deduced that language is a conditional stimulus, the concept of which is released by unconditional stimulation. In this paper it is experimentally shown that reading printed language as well as writing it has the same effect in the human.—*Journal summary.*

8138. Weiss, Robert F., Buchanan, William; Altstatt, Lynne, & Lombardo, John P. (U. Oklahoma) **Altruism is rewarding.** *Science*, 1971(Mar), Vol. 171(3977), 1262-1263.—Reports 2 studies with 144 undergraduates designed to show that people will learn an instrumental conditioned response for which the sole reward is removing another person from suffering. Exp. I investigated whether altruistic reward has the same characteristics as conventional rewards of escape conditioning. Exp. II investigated whether cessation of another person's suffering exhibits the property of rewards based on their timing. Results indicate that instrumental behavior can be learned and maintained solely through the rewarding function of altruism. Results further indicate "a profound similarity between the action of altruistic and conventional, nonaltruistic rewards: not only can learning be based on altruistic reward, but 2 standard parameters of reward, delay of reward and partial reward, show the same effects with both." P. McMillan.

Verbal Learning

8139. Boyd, William M. (U. Massachusetts) **Combining identical sets of pre- and postquestions in prose learning.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5653-5654.

8140. Martin, Edwin. (U. Michigan) **Verbal learning theory and independent retrieval phenomena.** *Psychological Review*, 1971(Jul), Vol. 78(4), 314-332. Reports that the chief concerns of verbal learning theory are how people learn a new behavior (C) in a situation (A) for which there already exists a learned behavior (B) and how these competitive behaviors are remembered. Various theories entail postulated dependencies among A, B, and C: (a) associative interference theory has focused on A-B, A-C associative interdependence; (b) list differentiation theory, on B, C availability interdependence; and (c) stimulus encoding theory, on stimulus identification interdependencies. The importance of isolating these postulated dependencies and of finding or failing to find the requisite dependencies in memory tasks where A, B, and C are to be retrieved in some form is discussed. (2 p. ref.)—*Journal abstract.*

Verbal Paired Associate Learning

8141. Postman, Leo. (U. California, Inst. of Human Learning, Berkeley) **Organization and interference.** *Psychological Review*, 1971(Jul), Vol. 78(4), 290-302.—Presents evidence for the functional continuity of the

products of subjective organization and of associative learning. 3 experiments with a total of 384 undergraduates were conducted in which the transfer effects of free recall on paired-associate learning were investigated. Words in the successive lists remained the same for the experimental groups and were unrelated for the control groups. Results show negative transfer in the acquisition of the paired-associate list and long-term proactive inhibition in the recall of the transfer task. The higher order units developed in the free recall phase were an effective source of interference when the transfer task required the establishment of new relations among the component items. The interitem dependencies established in free recall and in associative learning are viewed as commensurable phenomena that are likely to be governed by common principles. Implications for the analysis of extraxperimental sources of interference are discussed. (26 ref.) *Journal abstract.*

8142. Richards, William S. (Arizona State U.) **The effect of variations in patterning or lead-back and type of pre-test trial exposures on response repetition following verbal outcomes.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5611.

8143. Sampson, J. F. (Center for Research in Learning & Instruction, Sydney, New South Wales, Australia) **Delay of reinforcement in human verbal learning.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 35-45. Required 84 male and 84 female undergraduates to learn 5 simple paired associates. With speed of response as a measure and the presentation of the correct response item as reinforcement, both delay of reinforcement and activity during delay impaired training performance. Interference was no greater for activity composed of common associations with the stimulus than for unrelated material. Statistical treatment of the parameters of fitted hyperbolic curves reveal that both delay and activity significantly reduced performance asymptote. The curve parameters also show that activity was a significant determinant of growth rate although delay interval produced no significant growth effect. Lengthening the delay interval late in training lowered the performance of both active and inactive Ss; shortening the delay resulted in faster responding by only the active Ss.—*Journal abstract.*

8144. Wolford, George. (Dartmouth Coll.) **Function of distinct associations for paired-associate performance.** *Psychological Review*, 1971(Jul), Vol. 78(4), 303-313.—Developed and tested a model for predicting performance on a variety of paired-associate test types. The primary feature of the model is the assumption that Ss form distinct forward and backward associations within a single paired-associate item. Different test types have different numbers of associations available for mediating performance. 2 experiments were run with 50 adult Ss each using recall, recognition, and a variety of forced-choice test types. Results support the model. (35 ref.)—*Journal abstract.*

Reinforcement

MEMORY

8145. Carroll, Douglas & Horne, Peter V. (Australian National U., Canberra, Australian Capital Territory) **Semantic and acoustic labeling.** *Psychonomic Science*,

1971(Feb), Vol. 22(4), 241-242.—Compared the effects of semantic and acoustic labels, when both are equally available in 2 experiments with 80 undergraduates. Results demonstrate that both semantic and acoustic labels enhance memory. Such data is in discord with theories that attempt to dichotomize memory in terms of differential semantic and acoustic encoding.—*Journal abstract.*

8146. Daves, Walter F. & Rinn, Roger C. (Georgia State U.) **Free recall of object categories as a function of number of presentations of varied or repeated specimens.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 203-205.—Presented photographic slides of 18 categories of common objects to 24 male and 24 female undergraduates divided into 4 groups receiving 1, 2, 3, or 4 separate presentations of each category. For $\frac{1}{2}$ of the categories (V categories) up to 4 different specimens represented the category; for the other $\frac{1}{2}$ (R categories) the same specimen was repeated up to 4 times. Recall was tested both immediately and after an approximate 2-wk delay. For immediate recall the V categories were recalled best, and recall was a positive function of number of presentations. The R categories were recalled less after 2 and 3 presentations than after 1, but recall increased with the 4th presentation. Similar findings were obtained in 2-wk recall, although there was no overall effect of variety, and interpretation of the findings was complicated by significant 2-way interactions between sex and variety and sex and repetitions, as well as a significant main effect of sex.—*Journal abstract.*

8147. Daves, Walter F. & Rinn, Roger C. (Georgia State U.) **The variety effect in free recall as a function of prerecall activity.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 226-227.—Studied the enhancement of free recall of object categories represented by varied, as opposed to repeated, specimens, when 24 undergraduates recalled immediately after presentation of the stimuli vs. 24 Ss who worked arithmetic problems for 1 min. before recalling. All Ss recalled 3 times, the 2nd and 3rd recalls in all cases being preceded by 1 min. of arithmetic. Results indicate no change in recall over the 3 trials. However, the varied categories were recalled better than the repeated categories, and the difference was reduced when interpolated activity was required. The interpolated activity was more effective for the female Ss and appeared to depend upon the particular categories that were varied or repeated. Findings are interpreted as indicating the contribution of retrieval processes to the variety effect.—*Journal abstract.*

8148. Erdelyi, Matthew. (Lehman Coll., City U. New York) **Recovery of unavailable perceptual input.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 99-113.—Reports 2 experiments on the "recovery effect." In Exp. 1, with 36 undergraduates, Ss' recall of a briefly flashed stimulus was tested before and after fantasy generation. Postfantasy recall was greater than prefantasy recall to an extent that significantly exceeded corresponding increases in recall obtained by control Ss. 1 group of control Ss did not generate fantasy, while the other produced fantasy but copied an experimental S's 1st recall attempt instead of seeing the stimulus. When the number of responses emitted in postfantasy recall was equalized for all groups, however, the difference in recall increments disappeared between the fantasy and nonfantasy group, suggesting that fantasy augments response rates rather than sensitivity to the stimulus.

trace. Exp. II with 32 Ss confirmed this inference. A recognition indicator with confidence ratings was employed, from which receiver-operating characteristic functions were extracted, allowing direct measures of pre- and postfantasy sensitivity. No sensitivity increments were found in either the fantasy or the nonfantasy group, though fantasy affected confidence ratings and, therefore, hit and false alarm rates.—*Journal abstract.*

8149. Foss, Donald J. & Dowell, Ben E. (U. Texas) **High-speed memory retrieval with auditorily presented stimuli.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 465-468.—Presented 3 lists of 1, 2, and 4 consonantal phonemes to 2 groups of 8 undergraduates for memorization. Tests words were presented, and RT for S to say whether or not the word started with a member of the memorized list was measured. RT increased with list length (LL). In 1 group, the phonemes comprising the memorized sets were dissimilar, and RT increased linearly with LL. In the other group, the phonemes comprising the sets were similar, and the function relating RT to LL appeared to deviate from linearity. Even after extended practice, all the evidence was consistent with a somewhat modified serial model of memory retrieval.—*Journal abstract.*

8150. Gadway, Charles J. (U. Oregon) **Serial position and growth curves in demand concept recall.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 139-142.—Since the serial-position effect has been demonstrated to diminish as learning progresses, it was hypothesized that only a weak recency serial-position effect would result from demand recall of concepts in a complex problem-solving situation. 6 groups of 14 randomly drawn undergraduates solved 15 problems, 5 soluble by each of 3 concepts (rules), recalled from prior instruction. Each group received a different permutation of the 3 concepts. The serial-position effect appeared to be minimal for demand recall of concepts with the predicted weak recency effect ($.01 < p < .05$) but no primacy effect.—*Journal abstract.*

8151. Glucksberg, Sam & Cowen, George N. (Princeton U.) **Memory for nonattended auditory material.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 149-156.—18 male undergraduates performed a dichotic listening task. Ss shadowed (repeated orally) a prose passage heard in 1 ear, and attempted, after delays ranging from .3-20.3 sec. to recall single digits that had been embedded in prose presented to the nonattended ear. Recall performance decreased from 0-5 sec. in a typical negatively accelerated fashion. No memory for the nonattended material was apparent between 5 and 20.3 sec. Data indicate that verbal material presented auditorily to a nonattended channel persists briefly, but is not transferred into a long-term store. (17 ref.)—*Journal abstract.*

8152. Haber, Ralph N. (U. Rochester) **How we remember what we see.** *Scientific American*, 1970(May), Vol. 222(5), 104-112.—Reports several studies dealing with memory. Studies of visual memory capacity indicate that recognition of large numbers of pictures is essentially perfect and that such recognition is based on representation in memory that is maintained without labels, names, or rehearsal. Additional research indicates that iconic images persist in memory for approximately 250 msec. A general model describing the process of extraction and storage of linguistic material from its representational form is described. Evidence that the iconic image aids in reading is discussed. It is

concluded that the adequate minimal processing time for encoding linguistic material into memory is about 250 msec.—P. Tolin.

8153. Hines, David & Satz, Paul. (Hershey Medical School, Pa.) **Superiority of right visual half-fields in right-handers for recall of digits presented at varying rates.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 21-25.—Hypothesized that the consistent superiority exhibited by right-handers for right visual half-field recall of digits may reflect the more direct connections between the right visual half-field and the speech areas of the left hemisphere. 66 right-handed undergraduates with no family history of sinistrality and 18 right-handed undergraduates with a family history of sinistrality served as Ss. 7 digits were presented in each trial, with 4 digits at the point of fixation and 3 in either the left or right visual half-field. The 1st 6 digits were presented in pairs, with 1 digit at fixation and 1 in the half-field, followed by 1 additional digit at fixation. The greatest asymmetry occurred at the faster presentation rates and for right-handers without family history of sinistrality. Results support the hypothesis and suggest that cerebral dominance is related to family history. (French & German summaries)—*Journal abstract.*

8154. Hochhaus, Larry. (Iowa State U.) **Editing processes in memory.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5663-5664.

8155. Lander, H. J. (Humboldt U., Psychology Section, Berlin, E. Germany) **Beiträge zur Psychologie des Gedächtnisses: VI. Über Strukturbildungsprozesse beim menschlichen Gedächtnis.** [Contribution to the psychology of memory: VI. Structure formation processes of human memory.] *Zeitschrift für Psychologie*, 1970, Vol. 178(1-2), 89-96.—Investigated the assumption made by the RA hypothesis of J. A. McGeech that a differential increase or decrease occurs in all intraserial associations in a serial-learning or forgetting process, respectively, provided that the conditioned relative reaction frequencies are taken as a measure of the association forces. The association method in conjunction with an interpolated test series was used. A stochastic operation model has been developed to permit a satisfactory prediction of the changes in the conditioned relative reaction frequencies in a serial-learning process. It is shown with the aid of a scale-theoretical assumption, that the RA hypothesis is applicable in the serial-learning processes only if the intraserial associations are regarded as an internal variable. The conditioned relative reaction probabilities can then be represented as an interference effect of the intraserial associations. (Russian summary)—*English summary.*

8156. Lindauer, Martin S. (State University Coll. New York, Brockport) **Unambiguity of forms and inequality of labels in studies of effect of language on memory for form.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 175-181.—Investigated the nature of the forms and labels used in the L. Carmichael, H. P. Hogan, and A. A. Walter study of the effect of language on the memory for form, a basis for subsequent studies and theory, because of some doubts about their methodological status. Matching and identification techniques were used in a perception task, followed by a recall measure, as a means of examining the appearance of the forms, and the retention of the labels. Ss were 2 groups of 99 and 58 undergraduates, respectively. The forms were not found to be equally assignable to their sets of labels, and to a lesser degree, the pairs of labels were unequally

recalled. This absence of control over the materials, while noted as an aspect of the data in previous research, has apparently been overlooked in interpreting earlier findings. Hence, it remains doubtful whether modifications in the memory for form are the result of verbal suggestions. *Journal abstract*

8157. Palmer, Michael B. (Arizona State U.) **The effects of categorization, degree of bilingualism, and language upon the recall of select monolinguals and bilinguals.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5857.

8160. Shapiro, S. I. & Bell, Jerold A. (U. Hawaii) **The formation of organizational units in free recall learning.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 217-218. —Studied free recall and subjective organizational performance as a function of various orders of presentation in an experiment with 240 undergraduates. Performance was enhanced by the consistent simultaneous or sequential presentation of the members of preestablished high organizational units and by consistent simultaneous presentation of arbitrarily selected low organizational units. Simultaneous but inconsistent presentation of low organizational units impoverished performance. *Journal abstract*

8161. Slak, Stefan. (U. Toledo) **Rated association values of numbers and response availability.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 246. —Studied the possibility that association values of numbers are S's estimates of response availability and, indirectly of item difficulty. 48 undergraduates were tested for response frequency of numbers from 1-100. In free recall, 5 high-association numbers were easier to recall than 5 low-association numbers. Additional analysis using response availability data made it possible to interpret S. Slak's findings in terms of association value or in terms of response availability. —P. Hertzberg.

8162. Southall, Stephen D. & Blick, Kenneth A. (U. Virginia) **The role of interference and trace decay in the retention of a simple psychomotor task.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 223-224. —Attempted to show whether interference theory and/or trace decay theory account for the forgetting found in motor short-term memory. Ss were 105 undergraduates, 1 variable was the number of prior responses (0-6) which the S experienced on a linear slide apparatus; another variable was the length of the retention interval (5, 40, and 75 sec.). There were no significant effects due to retention interval, number of prior responses, or the interaction between retention interval and prior responses. *Journal abstract*.

8163. Stelmach, George E. & Barber, Julie L. (U. California, Santa Barbara) **Interpolated activity in short-term motor memory.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 231-234. —Examined retention of kinesthetic information from blind positioning responses for 56 Ss. During a 30-sec retention interval, 1/2 of the Ss sat quietly with their hands on the lever; the other 1/2 learned an interpolated target which required an antagonistic response. Both conditions showed significant

amounts of forgetting. The mean differences between conditions as well as the differences between correlation coefficients across retention intervals were not significant. Results were consistent with memory-trace decay predictions. *Journal abstract*.

8164. Todd, William B. & Kessler, Clemm C. (Specia. Education District, Lake County, Ill.) **Influence of response mode, sex, reading ability, and level of difficulty on four measures of recall of meaningful written material.** *Journal of Educational Psychology*, 1971(Jun), Vol. 62(3), 229-234. —Attempted to clarify some of the contradictory findings of research on the effects of overt vs. covert responding in a learning situation. 150 undergraduates were assigned to 36 groups varying sex, reading ability, response mode, and level of difficulty. Reading ability was determined by using total scores on the Ohio State University Psychological Test. Comparisons were made on 4 dependent measures of recall. Results demonstrate that (a) reading ability must be controlled in studies of learning involving meaningful verbal material; (b) an unknown sex factor influences learning or recall of meaningful material; (c) the recall of ideas from meaningful material is influenced by the amount of material; and (d) the facilitating influence of overt responding is limited by the independent and dependent variables involved in the learning or performance situation. (22 ref.)—*Journal abstract*

8165. Weiss, Stephan D. (U. Massachusetts) **Field articulation and memory for neutral and potentially conflictual words.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5647.

8166. Wood, Larry E. (U. Iowa) **An objective test of goodness of fit of the continuous strength model in STM.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 424-426. —Evaluated the continuous strength model of recognition memory in a task where 22 undergraduates were tested for recognition of 10-number lists using a rating procedure. Maximum likelihood estimates of the parameters of the model were obtained by an iterative method on a high-speed computer, and a chi-square goodness-of-fit test was performed for individual Ss. For 15 Ss, the chi-square values were nonsignificant, $p > .05$, indicating that the model provided a good fit to the data. Although the model gave a good fit to the data, the Δm measure of sensitivity was highly correlated with a true recognition score computed by subtracting false alarms from correct recognitions.—*Journal abstract*.

Short Term & Immediate Memory

8167. Anders, Terry R. & Lillyquist, Timothy D. (Harvard Medical School, Boston, Mass.) **Retrieval time in forward and backward recall.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 205-206. —Compared the rates of forward and backward digit recall in an experiment with 10 female nursing students. Results show that recall was faster in forward than in backward order. This finding is consistent with the hypothesis that information can be retrieved from short-term memory only in the same order in which it is stored. *Journal abstract*.

8168. Bernbach, Harley A. (Cornell U.) **Strength theory and confidence ratings in recall.** *Psychological Review*, 1971(Jul), Vol. 78(4), 338-340. —Reports that the reasoning of a previous study by H. A. Bernbach (see

PA, Vol. 42:1776), which found that strength theory cannot account for the observed invariance of Type 2 receiver operating characteristic curves with respect to the probability of a correct response, was incorrect. A Monte Carlo simulation of strength theory and confidence ratings was run. Results indicate, as before, that strength theories relating confidence to strength cannot predict this invariance.—*Journal abstract.*

8169. Crowder, Robert G. (Yale U.) **The role of one's own voice in immediate memory.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 157-178.—Describes 2 experiments with 72 undergraduates comparing active and passive vocalization of visually presented digit series; in active vocalization S pronounced the elements as he saw them and in passive vocalization he heard E pronouncing them as he saw them. The effects of a redundant prefix were examined under the 2 vocalization conditions. Findings were (a) either vocalization condition was superior to silent visual presentation only for the last few serial positions, (b) active vocalization was worse than passive vocalization only for the 1st few serial positions, and (c) the prefix requirement reduced recency only following active vocalization, as predicted. Results are discussed against a pluralistic model of coding and storage. (33 ref.)—*Journal abstract.*

8170. Detterman, Douglas K. & Ellis, Norman R. (U. Dayton) **Distinctiveness in short-term memory.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 239-241.—Compared results from 6 experiments yielding serial position data using a positional probe task to predictions made on the basis of distinctiveness. The concept of distinctiveness is derived from psychophysical theory and indicates the degree to which a particular stimulus in a group "stands out" from the other stimuli in that group. It was found that results agreed closely with those predicted. The results are suggested as a possible explanation for the bowed serial position effect in short-term memory.—*Journal abstract.*

8171. Dick, A. O. (U. Rochester) **On the problem of selection in short-term visual (iconic) memory.** *Canadian Journal of Psychology*, 1971(Jun), Vol. 25(3), 250-263.—Discusses methodological and theoretical questions concerning the problem of selection in visual short-term memory. Data from 2 previously published experiments were reanalyzed and an additional experiment with 36 undergraduates was performed. There is no evidence in any of these experiments to support the idea that partial report is more accurate than whole report or that selection occurs in visual memory. (French summary) (16 ref.)—*Journal abstract.*

8173. Gordon, Ian E. & Fenouillet, Paul. (U. Exeter, England) **Repeated vs. varied distractors in immediate memory.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 474-476.—Presented groups of 8 spoken digits for immediate recall to 47 college of education students. Irrelevant distractor letters were interpolated between digits, using either the same letter interpolated 8 times or 8 different letters. The latter condition produced significantly more errors in recall. Error scores were also affected by rate of presentation of items and by whether letter-digit sequences started with a letter or a digit. It is suggested that selective immediate

recall may bear some resemblance to aspects of visual search.—*Journal abstract.*

8174. Harris, Gilbert J. (State U. New York, Buffalo) **Inter-task explorations with a computer simulation model of short-term memory.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5662-5663.

8175. McNicol, D. (U. Adelaide, South Australia) **The confusion of order in short-term memory.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 77-84.—Utilized J. Brown's (see PA, Vol. 39:13811) measure to determine the information preserved in types of errors committed in a short-term memory task by 12 undergraduates. The distributions of different errors over serial positions in the messages were observed. It was found that errors concerned with the ordering of items in a message preserved more information about the original stimulus than errors concerned with the selection of the items themselves. Although the serial position curve for all errors combined was bow-shaped and negatively skewed, as has been most commonly reported in the literature, curves for different types of errors differed markedly in their shapes. Results are not easily explained by a theory which attributes the serial position effect solely to the effects of recency and rehearsal, but are compatible with the view that some serial positions are more discriminable than others.—*Journal abstract.*

8176. McNicol, D. (U. Adelaide, South Australia) **The origins of transpositions in short-term memory.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 9-17.—Tested the fixed address model for short-term memory proposed by R. Conrad (see PA, Vol. 39:13962) which suggests that order errors in recall arise from fortuitous selection of intrusions from an unordered response availability store. 10 research students and undergraduates recalled consonant trigrams of high acoustic confusability, each trigram being followed by an interpolated task of acoustically similar or dissimilar letters. Contrary to the model's predictions (a) order errors occurred more often in recall, and (b) there was no significant tendency for order errors to decrease when the interpolated task was similar to the message to be recalled. It is concluded that the traditional distinction between intrusion and order errors is valid, and that messages for short-term memory are coded along at least 2 dimensions, 1 designating item content, and the other, the order of items.—*Journal abstract.*

THINKING

8179. Danks, Joseph H. (Kent State U.) **Encoding of novel figures for communication and memory.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 179-191.—Descriptive names (encodings) were given to novel, graphic figures by 120 undergraduates under 1 of 3 instructions: social-communicative, self-memorial, or associative. 2 wk. later these same Ss plus a group of naive Ss attempted to match their own encodings and those of another S from each of the groups with the correct figure. The memorial and social Ss performed better on their own encodings than the associative Ss,

and there was some indication that the memorial Ss also performed better than the social Ss. The social and memorial encodings were better communicators to others than the associative ones, but there was no difference between social and memorial encodings. Results are interpreted in terms of a communication model involving the criteria used for editing encodings and the availability of conventional labels for the stimuli. *Journal abstract*

8180 Haynes, Jack R. (North Texas State U.) **Hierarchical analysis of factors of cognition.** *American Educational Research Journal*, 1970(Jan), Vol. 7(1), 55-68. 34 tests for Guilford's model of cognition were administered to 200 undergraduate males. It was postulated that a hierarchical arrangement of cognitive factors could be demonstrated. The battery of tests was analyzed by a Wherry hierarchical factor solution. The analysis revealed 15 1st-order orthogonal factors at 3 levels. The highest level was a general factor composed of many functions related to the awareness and understanding of symbolic and figural information. The 2nd level of the hierarchy consisted of 2 subgeneral factors measuring different aspects of higher level cognitive functioning. At the 3rd level were 11 specific group factors which were very similar to the factors in Guilford's model. The concept of cognitive abilities being related in a hierarchical fashion was supported by the results. *Journal abstract*

8182. Slama-Cazacu, Tatiana & Dabija, Anca. (U. Bucharest, Inst. for Foreign Languages & Literatures, Romania) **Perception time and motor reaction time for verbal stimuli of different lengths (words and "abbreviations").** *Revue Roumaine des Sciences Sociales-Serie de Psychologie*, 1970, Vol. 14(2), 119-137. Attempted to demonstrate that RT variations depend on verbal meaning as well as stimulus length and are in part a function of experimental method. 12 critical stimuli consisting of 3 whole words and their 2-4 letter and single letter abbreviations were embedded among 45 neutral stimuli and presented tachistoscopically to native Romanian speakers of college age. Ss responded verbally (tachistoscopic exposure time) and by button pressing (motor RT). Data for 19 Ss indicated that whereas exposure time varied directly with stimulus length, motor RT varied inversely with length. The latter measure was postulated to require verbal mediation such that whole words which correspond directly with lexical information storage patterns were responded to more quickly than their abbreviations which require mediation through the parent word for decoding. 8183. Thompson, Charles P. (Kansas State U.) **Note on word frequency as a factor in perception of category size.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 301-302. -Found ratings of category size to be affected by the normative frequency of the words representing the category with low-frequency exemplars decreasing perceived category size. Ss were 76 college students. Results also suggest that Ss generate more category associates for high- than low-frequency words. *—Journal abstract.*

Problem Solving

8184. Johnson-Laird, P. N. & Wason, P. C. (Univer-

sity Coll. London, England) **A theoretical analysis of insight into a reasoning task.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 134-148. Presents an information-processing analysis of insight into a singularly deceptive and difficult deductive problem. 2 models are described. The 1st represents an economical explanation of the Ss' initial responses but is difficult to reconcile with their subsequent responses induced by certain remedial procedures. The 2nd model does take account of such responses and shows how insight into the correct solution is correlated with the awareness that tests for falsification are more appropriate than tests for verification. The relevance of the results and the explanatory model are discussed in relation to wider issues. (17 ref.) *Journal abstract*

8185. Shapiro, Diana. (University Coll., London, England) **"Representativeness," structure and content in a reasoning problem.** *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 43-44. -Analyzes the criticism lodged by N. E. Wetherick (see PA, Vol. 45:342) concerning some experiments on reasoning conducted by P. C. Wason (see PA, Vol. 44:4854). Essentially Wetherick has charged that Wason's experiments were "not representative of everyday reasoning." Upon analysis, it is concluded that the difficulty of Wason's task "does not seem to be solely due to the fact that the problem presents a structure which is uncommon in everyday life. Rather the evidence suggests the existence of an interaction between structure and content in a reasoning problem. The concept of 'representativeness' is too imprecise to explain the Ss' behaviour." F. S. Sexton.

8186. Sydow, H. (Humboldt U., Berlin, E. Germany) **Zur metrischen Erfassung von subjektiven Problemzuständen und zu deren Veränderung im Denkprozess: II. [Metric comprehension of subjective problem conditions and their changes in the thinking process. II.]** *Zeitschrift für Psychologie*, 1970, Vol. 178(1/2), 1-50. States essential elements of the problem-solving process, and discusses the part they play in Duncker's work and in present simulation programs, all in connection with methodological considerations on the analysis of thought processes. It is noted that with the method of passive individual tests—in opposition to active tests—problem-solving processes are released which include the same essential components as gathered from active individual tests. The hypotheses which can be deduced from the model set out for the processing of information for the problem-solving process are examined by using theories of decision and scaling. The simulation of stationary phases of the solution process for the examination of the effect of memory variables is described. (Russian summary) (3 p. ref.)—*English summary.*

Concepts

8187. Towler, John O. & Wheatley, Grayson. (Purdue U.) **Conservation concepts in college students: A replication and critique.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 265-270. -D. Elkind's (see PA, Vol. 37:5648) study of college students' concepts of the conservation of mass, weight, and volume was replicated with a sample of 71 female college students. Results indicate that the students could conserve mass and weight but only 61% had adequately formed concepts of

the conservation of volume. Numerous examples of illogical thinking were identified and 1 of Elkind's methodological procedures is criticized. Poorly formed concepts of atomism is hypothesized to be the reason for the failure of the Ss to score highly in tests of volume conservation.—*Author abstract.*

8188. Trinder, John A. (U. Cincinnati) **The contribution of four attribute characteristics to stimulus saliency.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5681-5682.

8189. Wolfgang, Aaron. (Ontario Inst. for Studies in Education, Toronto, Canada) **Errors and latency of response as a function of order of presentation of tactile-visual stimuli in concept identification.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 237-238.—Designed a task using plastic geometric objects to study concept identification through the tactile sense in an experiment with 22 19-33 yr. old military duty personnel. Overall results show that errors and time to solution were similar in classifying visual and tactile information, but response latency was significantly longer in tactile than in visual concept identification. Also, there is some suggestive evidence that visual concept identification was facilitated with practice on a tactual task, whereas tactual concept identification was not facilitated by practice on a visual task.—*Journal abstract.*

DECISION & CHOICE BEHAVIOR

8191. Alker, Henry A. & Hermann, Margaret G. (Cornell U.) **Are Bayesian decisions artificially intelligent? The effect of task and personality on conservatism in processing information.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 31-41.—Used a 2×3 design to explore the effects of complexity and importance of decision on conservatism in processing information. 120 undergraduate males in processing information. 120 undergraduate males considered 2 or 3 alternative explanation for 1 of 3 problems differing in perceived importance, and indicated which explanations was more or most probable. These probability statements were compared with "optimal" probabilities, arrived at by using Bayes's theorem. The more important and complex the decisions were perceived to be, the more conservative the Ss were when compared to optimal Bayesian values. The differences were more pronounced as the number of alternatives increased. 7 individual difference variables measuring adequacy in processing information were unrelated to conservatism. A process analysis suggests that strongly held initial opinions can limit the judged relevance of subsequent information and, in turn, affect the optimal Bayesian decision. (20 ref.)—*Journal abstract.*

8192. Cooper, Joanne M. (U. California, Berkeley) **Information usage and responses to failure in a decision task.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5194.

8193. Hanson, Bruce L. & Schipper, Lowell M. (Pennsylvania State U.) **Numerosity in probability learning and decision making with multiple equivalent predictors.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 199-201.—In an experiment with 66 male and 56

female undergraduates, multiple probability learning with 4 predictors and a single event to be predicted used 5 treatments with $\pi_s = .10, .30, .50, .70$, or $.90$ for each of the 4 predictors, respectively. Subsequent decision making consisted of predictions without feedback given each of the 15 combinations of the 4 predictors within each treatment. In decision making, significantly more predictions of the event were made to the foursome than to combinations of less than 4. Additionally, triples resulted in reliably more predictions than doubles. The end effect of the foursome is reminiscent of that found by others. Additionally, reliable sex differences were found in probability learning for the $.10$ and $.30$ treatments.—*Journal abstract.*

8195. MacRae, Kenneth D. (Queen's U., Belfast, Ireland) **Some remarks on Edwards' probability-preference experiments.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 300.—Review 3 sets of bets established by W. Edwards: (a) same positive expected value (PEV), (b) zero expected value (ZEV), and (c) same negative expected value (NEV). It is argued that the ZEV bets are the type usually found in gambling situations, and that the PEV and NEV bet probability-preferences cannot be generalized to the more usual "win or lose" type of bet found in gambling. Edwards' interpretation of preferences among his bets as being "probability-preferences" is questioned. His studies are considered inadequate due to the nature of the bets and the interpretation of results.—*P. Hertzberg.*

8196. Murray, Frank S. (Randolph-Macon Woman's Coll.) **Multiple probable situation: A study of a five one-armed bandit problem.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 247-249. Studied the decision making of 14 undergraduates in a multiple-probable situation analogous to a gambling situation. On each of 250 trials, S selected 1 of 5 probable alternatives. Occurrences of each alternative, I_1 , were: $.00, .125, .25, .25$, and $.50$. Results indicate that (a) slight overshooting to the most probable alternative, and under-occurred to the less probable alternatives, (b) learning to select the most probable alternative resulted from Ss' experiences in the situation, (c) significant effects of different sizes of trial sequences were noted, and (d) significant relationships between repetition of responses on Trial $n + 1$, if I_1 occurred on Trial n , with total number of probable alternatives selected and total number of reinforcements significant.—*Journal abstract.*

8197. Pike, A. R. (U. Queensland, Brisbane, Australia) **The latencies of correct and incorrect responses in discrimination and detection tasks: Their interpretation in terms of a model based on simple counting.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 455-460.—Describes a model for 2-choice discrimination based on a process of simple counting. 2 experiments with a total of 40 Ss were performed to test the predictions of the model concerning the graph of latency as a function of response proportion. 2 main forms of this graph were identified and predicted to arise in different circumstances. Results support the model. The possible extension to other psychophysical situations, especially signal detection, is discussed. The model is compared with one derived directly from the detection situation, and the usefulness of testing these models is indicated. (35 ref.)—*Journal abstract.*

8198. Quadrio, Assunto. (Catholic U. of the Sacred Heart, Milan, Italy) **L'influenza della consapevolezza di rischio sulla previsione.** [Influence of awareness in risk guessing. Note to preceding paper.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 184-189. As a note to another study (see A. Quadrio, G. Peri, & A. Branca, PA, Vol. 46, Issue 4), guessing strategies follow probabilistic rules and depend on the degree of subjective certainty of success probability.—L. L'Abate.

8199. Quadrio, Assunto; Peri, Giovanni, & Branca, Antonia. (Catholic U. of the Sacred Heart, Milan, Italy) **Causa e caso nella probabilità soggettiva in un esperimento di previsione.** [Cause and chance in subjective probability in a guessing experiment.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 159-183. Guessing games using objective results indicate that logical concepts and mathematical probabilities are followed. When the regularity of such results is frustrated, unrealistic and magical mechanisms are followed. (26 ref.)—L. L'Abate.

8200. Rule, Brendan G. & Evans, James F. (U. Alberta, Edmonton, Canada) **Familiarization, the presence of others and group discussion effects on risk taking.** *Representative Research in Social Psychology*, 1971(Jan), Vol. 2(1), 28-32. Examined the effects of familiarization on risk taking and explored the possibility that emotional arousal is implicated in risk-taking increase. 6 male Ss responded to 6 items of the Wallach and Kogan Choice Dilemma Task questionnaire. These Ss subsequently responded to the same 6 items under 1 of 3 conditions: alone, in the presence of others, or in group discussion. The 1st 2 conditions required Ss to familiarize themselves for 5 min with each issue by considering and recording the pros and cons associated with each decision, whereas the 3rd condition required that Ss discuss each issue for 5 min. Data consisted of risk increase scores and heart rate change. Results indicate that risk increased only in the group discussion condition. These data, and those from other experiments, suggest that the familiarization effect is tenuous. Heart rate was not differentially affected by the experimental conditions, and provided no support for the notion that arousal is a component of risk taking. (22 ref.)—*Journal abstract*.

PHYSIOLOGICAL PSYCHOLOGY

8202. Finger, Frank W. & Mook, Douglas G. (U. Virginia) **Basic drives.** *Annual Review of Psychology*, 1971, Vol. 22, 1-38.—Reviews physiological literature in the areas of sexual behavior, control of ingestion, general activity, and the problem of localization. The 1st category includes a description of sexual behavior, neurophysiological correlates, individual and age differences, experience, critical sense modalities, variety, extraneous stimulation, patterning of copulatory sessions, characteristics of the partner, and activation and reinforcement of other behavior. The 2nd category includes control of water intake, glucostatic control of feeding, regulation of meals, regulation of body weight,

and preferences and aversions. The 3rd category includes neural mechanism and food deprivation. (220 ref.)—*Herrnberg*.

8203. Hughes, B. O. & Wood-Gush, D. G. (Agricultural Research Council, Poultry Research Centre, Edinburgh, Scotland) **Investigations into specific appetites for sodium and thiamine in domestic fowls.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 331-339. Conducted 2 experiments with 28 and 30 male and female domestic chickens. A specific appetite for NaCl in sodium-deprived Ss was not demonstrated regardless of whether the deprivation was induced by feeding a deficient diet or by producing a functional deficiency by the subcutaneous injection of formalin. Ss exhibited a preference neither for NaCl-supplemented diets nor for .7% saline when tested in 2-choice situations. Normal Ss were indifferent to .7% saline when tested by the method of single stimuli, but under simultaneous choice conditions showed a strong aversion to it, which intensified with time. This was explained in terms of aversive feedback. Thiamine deficiency was induced in Ss by feeding a metabolic antagonist. A well-marked specific appetite for this vitamin could be demonstrated in these deficient Ss. (27 ref.)—*Journal abstract*.

8205. King, Nancy W., Justesen, Don R., & Clarke, Rex L. (Veterans Administration Hosp., Neuropsychology Lab., Kansas City, Mo.) **Behavioral sensitivity to microwave irradiation.** *Science*, 1971(Apr), Vol. 172(3981), 398-401. In an experiment with 6 male albino rats (3 controls and 3 for irradiation) it was found that Ss assayed by the technique of conditional suppression were able to detect the presence of 12.25-cm microwaves at doses of power approximating .5-6.4 mw/gm. The assay, which controlled for sensitization, for pseudo and temporal conditioning, and for several possible sources of artifactual cueing, reveals that irradiation by microwaves, although lacking the salience of an auditory stimulus, can function as a highly reliable cue. Efficiency of detection was strongly and positively related to the amount of microwave energy to which the Ss were exposed. (31 ref.)—*Journal abstract*.

8206. Luk'yanov, A. N. & Frolov, M. V. **Ispol'zovanie fiziologicheskikh signalov dlya otsenki vnimaniya operatora.** [The use of physiological signals for assessing the attention of the operator.] In A. N. Luk'yanov & M. V. Frolov, "Signaly sostoyaniya cheloveka-operatora." (See PA, Vol. 44:11853) 35-97.—Presents technical and analyses of the "signals of state of attention," and the mathematical techniques for treating the data thereof. Among the latter are: (a) correlated properties of sequential readings of the α -rhythm integrator, (b) evaluation of the unidimensional distribution law for values of random sequential readings of the α -rhythm integrator, (c) attention and the dispersion of random sequential readings of the α -rhythm integrator, (d) correlated properties of sequential intervals in the respiratory cycle, (e) distribution law of random sequential intervals of the respiratory cycle, (f) duration of the respiratory cycle and efficiency, (g) the transitory process reflected in the sequential intervals of a change in functional states, (h) correlated properties of the sequential intervals in the inspiratory phase, (i) evalu-

ation of the unidimensional distribution law of intervals for the inspiratory phase, and (j) change in maximal absolute deviation of the distribution law from the normal as a function of size of sample.—*I. D. London.*

8207. Noel, Patricia S. & Carlson, Eric T. (Cornell U., Medical School, New York, N.Y.) **Origins of the word "phrenology."** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 694-697.—Phrenology is defined as the study of the conformation of the skull as indicative of mental faculties and character. The development of this definition is traced from Benjamin Rush, who meant phrenology to describe faculty psychology, through Franz Joseph Gall, who linked faculty psychology and craniology, to Thomas Forster and Johann Spurzheim, who gave the word its present meaning. (17 ref.)—*Journal abstract.*

8208. Revusky, S. H., Smith, M. H., & Chalmers, D. V. (Northern Illinois U.) **Flavor preference: Effects of ingestion-contingent intravenous saline or glucose.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 341-343.—Fed 24 food-deprived male Sprague-Dawley rats with iv cannulae, a nonnutritive sweetened coffee solution on 5 occasions. Shortly after each such drinking period, 13 Ss were infused with (a) 5-10 ml of 10% glucose solution, or (b) .9% saline solution. A 3rd group was not infused at all. In a subsequent preference test between sweetened coffee and saccharin solution, the saline group had a reduced preference for coffee relative to the other 2 groups, which did not differ significantly between themselves. A replication with 31 Ss changed a number of procedural details. Results of the 2 experiments were similar.—*Journal abstract.*

8209. Stricker, Edward M. (U. Pittsburgh) **Effects of hypovolemia and/or caval ligation on water and NaCl solution drinking by rats.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 299-305.—Investigated the role of the renin-angiotensin system in sodium appetite using 96 male Sprague-Dawley albino rats. Subcutaneous injection of hyperoncotic polyethylene glycol (PG) solution was used to produce hypovolemia, while total infrahepatic ligation of the inferior vena cava (IVC) was used to increase renin secretion and circulating levels of angiotensin. Most Ss initially preferred water and drank little saline when both fluids were available. PG-treated Ss later developed a sodium appetite and, by consuming increased amounts of saline, always repaired their plasma deficits. In contrast, IVC ligated Ss did not evidence sodium appetite during the 24-hr test period, even following PG injection treatments. Results suggest that the renin-angiotensin system may not have an important role in stimulating sodium appetite in rats, and that some aspect of the combined IVC ligation and PG injection treatment may inhibit this drive. (42 ref.)—*Journal abstract.*

8210. Stricker, Edward M. (U. Pittsburgh) **Inhibition of thirst in rats following hypovolemia and/or caval ligation.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 293-298.—Elicited thirst in 148 adult male Sprague-Dawley albino rats by subcutaneous injections of a hyperoncotic polyethylene glycol (PG) solution or by infrahepatic ligation of the inferior vena cava (IVC). Ss given either treatment drank throughout the 24-hr test period when only saline was available but decreased drinking significantly within 6-8 hr. when given only water. It is suggested that the inhibitory mechanism may involve reduction of the effective osmotic pressure of body fluids and cellular overhydration. Ss drinking water

following combined IVC ligation and PG injection treatments required a greater degree of cellular overhydration to inhibit drinking than Ss given either treatment alone. When saline was presented instead of water, the complex stimulus for thirst elicited more drinking with fluid retention than any other experimental procedure known. The extreme potency of this preparation reflects the comparable strength of the inhibitory mechanisms associated with cellular overhydration.—*Journal abstract.*

8214. Brunia, C. H. (Hans Berger Clinic, Breda, Netherlands) **The influence of a task on the Achilles tendon and Hoffmann reflex.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 367-373. Conducted 4 experiments with 22 human 20-30 yr. old Ss. If Achilles tendon (T) and Hoffmann (H) reflexes were simultaneously evoked at rest and during the performance of a task, an increase of the amplitude of the T reflexes was seen during the task, without a significant influence on the H reflex amplitudes. This is interpreted as a facilitatory influence on the fusimotor system, probably originating from the reticular formation of the brainstem. The relation of this finding to other experiments, in which similar parameters have been used, is discussed. (28 ref.)—*Journal abstract.*

8215. Chi, Carl C. & Flynn, John P. (Yale U., Medical School) **Neural pathways associated with hypothalamically elicited attack behavior in cats.** *Science*, 1971(Feb), Vol. 171(3972), 703-706.—Made small electrolytic lesions in 7 cats through electrodes, which, when

stimulated, elicited either quiet biting attack or affective paw strike attack upon rats. The Nauta method for impregnating degenerating axoplasm was used and revealed that degeneration resulting from lesions at quiet attack sites followed largely along the course of the medial forebrain bundle, while the degeneration after lesions of affective attack sites was concentrated more heavily in the periventricular system (17 ref.) *Journal abstract*.

8216. Dubromyslova, O. P. & Aver'yanova, I. A. (Leningrad Medical Inst. of Sanitation & Hygiene, USSR) **Ob afferentatsii myshtsy pri ee utomlenii.** [On afferentation of the muscle when it is fatigued.] *Fiziologicheskii Zhurnal SSSR*, 1970(Oct), Vol. 56(10), 1411-1417. Studied spontaneous and evoked afferent impulses in the peripheral end of the sciatic nerve when frog gastrocnemius muscle was fatigued in situ. It was established that (a) weakening of muscle activity was accompanied by a decrease in the flow of spontaneous afferent impulses, and (b) in the fatigued muscle the functional state of the receptors was changed with resultant diminution of evoked impulses. In the latter case the functional state was heightened in the initial stage of fatigue and lowered in the period marked by a clear-cut diminution of muscular efficiency. (English summary) (16 ref.)—*I. D. London*

8217. Elias, Merrill F. (Duke U., Center for the Study of Aging & Human Development) **Spatial discrimination reversal learning for mice genetically selected for differing brain size: A supplementary report.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(D), 239-245. Explored spatial discrimination reversal learning for 17 mice genetically selected for high brain weight and 17 unselected controls with lower brain weights. Control-line Ss escaped from a water maze more rapidly, but high-line Ss made fewer errors and took less trials to reach criterion on the 1st reversal. Control-line Ss were unable to complete more than 1 reversal, while high-line Ss all completed at least 7 reversals. This positive relation between reversal learning and brain size is consistent with comparisons among species and experiments manipulating brain size by means of drugs or surgery. (16 ref.) *Journal abstract*.

Reports that laser radiation at 488 nm. selectively stimulated neurons in the abdominal ganglion of the marine mollusk (*Aplysia californica*). The laser radiation can be scanned over the surface of the ganglion and effectively utilized in mapping cellular interconnections. The laser appears to cause these changes through some mechanism other than damage.—*Journal abstract*.

8219. Geinismann, Yu. Ya., Larina, V. N., & Mats, V. N. (USSR Academy of Sciences, Inst. of Higher Nervous Activity & Neurophysiology, Moscow) **Changes of neurones dimensions as a possible morphological correlate of their increased functional activity.** *Brain Research*, 1971, Vol. 26(2), 247-257. Studied the effects of increased functional activity of spinal motoneurons morphologically on male albino rats in experiments with swimming under different loads and with orthodromic electrical stimulation of 5-40 min. duration. The volume of lumbar motoneurons was calculated from major and outlines on cells' negative projections. Formulas for volume calculations were derived from an optical

reconstruction. Both mild and intensive natural motor activity as well as orthodromic stimulation, resulted in a decrease of the motoneuronal cytoplasmic volume in the longest duration (40 min.) of the experiments. The changes of cytoplasmic dimensions were accompanied by a decrease of the nuclear volume after 40 min. intensive swimming and orthodromic stimulation. The increase of motoneuronal size was registered only in earlier periods of activation, 5 min. after the beginning of mild swimming for the nucleus, and 10 min. after the beginning of orthodromic stimulation for motoneuronal cytoplasm. Thus the motoneuronal size changes depended on the duration, intensity, and character of the stimulation. Results make it seem that the decrease of the spinal motoneuronal nuclear and cytoplasmic volume might be considered a morphological correlate of their increased functional activity. (42 ref.)—*Journal summary*

8226. Kislyakov, V. A., Levashov, M. M., Orlov, I. V., & Semenov, L. A. (USSR Academy of Sciences, Pavlov Inst. of Physiology, Leningrad) **O vzaimodelstvi polukruzhnykh kanalov i otolitov.** [On the interaction of the semicircular canals and the otoliths.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1731-1744.—Studied the effect of centrifugal force (CFF) on the pigeon head nystagmus. The CFF seems to act on the semicircular canals either via the system otoliths—nervous centers, or via direct effect on the cupula mechanics. Either of the 2 possibilities is realized according to the value of the CFF, its changes with time and its direction along the longitudinal body axis, and according to the nystagmus-provoking stimulation. Changes of the rotatory and galvanic nystagmus thresholds result from indirect CFF effect (via otoliths and centers) on the inhibitory. During the caloric test, the direct CFF effect on the endolymphatic flows prevails. Such effect is able either to weaken or to intensify the endolymph displacement and even to reverse their direction (according to direction of the CFF). In this case, the central effect of the CFF is masked by the stronger "peripheral" one, which results from peculiarities of the canal hydrodynamics in the CFF field. (27 ref.)—*Journal summary.*

8227. Lonskii, A. V. & Kalashnikov, I. M. (Leningrad State U., USSR) **Vliyaniye ul'trazvuka na protsess vozbuzhdeniya nerva.** [Influence of ultrasound on the process of nerve excitation.] *Nervnaya Sistema*, 1969(Dec), No. 10, 157-162.—Isolated frog sciatic nerve was irradiated in an ultrasonic bath filled with Ringer's solution, under conditions excluding noticeable warming, in a study to determine the influence of the specific factor of ultrasound on the electrophysiological characteristics of the nerve. Decrease was noticed in amplitude of action, threshold of electrical stimulation, and speed of excitatory conduction. In degassed Ringer's solution, ultrasonic irradiation also decreased the amplitude of action and speed of conduction; however, electrical threshold remained unchanged, while electrical conductivity of the nerve increased with excitation. It is suggested that ultrasonic irradiation in the usual Ringer's solution leads to an increase in the resistance of the membrane of Ranvier's node in the quiet state, whereas

ultrasonic irradiation in degassed Ringer's solution leads to an increase in the excited state.—*I. D. London.*

8228. Makarov, P. O. (Leningrad State U.) **Problema pamyati pri sverkhsl'nykh razdrazheniyakh i nastroechnykh refleksakh "nado."** [The problem of memory in extra-strong stimulation and the adjusting reflex "it's necessary."] *Nervnaya Sistema*, 1969(Dec), No. 10, 144-149.—A discussion, based on the author's past research, on the problem of memory, which in its biophysical aspect is seen as reducible to a consideration of the physicochemical and functional aspects of its nervous substrate. Viewing an adjusting reflex as one which appears when there is a change (readjustment) in the functional state of the biosystem involved, the readjustment of the functional state of neurohumoral systems in the guise of adjusting CRs and UCRs, as in thirst, may be linked with the long-lived traces characteristic of memory. A short (.9 msec.) extra-strong stimulation of the visual analyzer, for example, produces a long-lived wavelike trace in the form of changes in excitability lasting tens of minutes.—*I. D. London.*

8229. Makarov, P. O. & Safronova, L. G. (Leningrad State U., USSR) **K izucheniyu vozbudimosti kozhnogo analizatora cheloveka.** [On the excitability of the human cutaneous analyzer.] *Fiziologicheskii Zhurnal SSSR*, 1970(Oct), Vol. 56(10), 1498-1499.—Develops a statistical method for assessing cutaneous excitability with results that agree well with experimental data. The method makes a more exact determination of "useful time" possible.—*I. D. London.*

8230. McAdam, Dale W. & Whitaker, Harry A. (U. Rochester) **Language production: Electroencephalographic localization in the normal human brain.** *Science*, 1971(Apr), Vol. 172(3982), 499-502. Recorded slow negative potentials, which are at a maximum over Broca's area in the left hemisphere, when 8 right-handed women with normal speech spontaneously produced polysyllabic words. Bilaterally symmetrical potentials were seen with analogous, nonspeech control gestures. These potentials began up to 1 sec. before word or gesture articulation. Results are the 1st demonstration of localization of language production in normal human brain.—*Journal abstract.*

8231. Murav'eva, N. P. & Kalyagin, V. A. (Inst. of Experimental Medicine, Leningrad, USSR) **O mezhsentral'nykh otnosheniyakh pri uprochnenno slozhnom ritmicheskom stereotipe refleksov.** [On intercentral relationships in the stabilized complex rhythmic stereotype of reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 908-916.—6 dogs were Ss in a study to determine the functional state of nonparticipatory nerve elements of the auditory and visual analyzers after a stabilized rhythmic stereotype of 4 positive and 4 inhibitory salivary CRs to different frequencies of a metronome (60 300/min) had been developed. Analogous stereotypes to pure tones (500-2500 cps) and to flashing light (60 300/min) were then formed and alternated with the stabilized stereotype. Elaboration of a stereotype to new acoustic stimuli can be accompanied by a complete reproduction of all the features of the already formed activity system. In the development of a photic stereotype, an almost complete absence of secretory CRs and a decrease in the mutual phase of unconditioned salivation were observed. The stabilized stereotype of nervous processes in 1 analyzer exerted an inhibitory influence on negative induction in another analyzer. Depending on the degree of concen-

tration of the nervous processes in the stabilized stereotype, induced inhibition was also manifested in the originally nonparticipatory nerve elements of the same analyzer. In the nonparticipatory nerve elements a rhythmic shift of excitability was reproduced in "counterphase" with the stabilized systemic nervous process and at a low level. Readjustment of stereotypically conditioned intercentral relationships, reinforced by the experimental setting and responding to it, took place at different rates during the elaboration of a new stereotype, depending on type of nervous system and its functional state (English summary)—*I. D. London.*

8232. Oldfield, R. C. (Edinburgh U., Medical Research Council Speech & Communication Unit, Scotland) **The assessment and analysis of handedness: The Edinburgh inventory.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 97-113.—Discusses the need for a simply applied quantitative assessment of handedness and reviews some previous forms. An inventory of 20 items with a set of instructions and response- and computational-conventions is proposed. Results obtained from 1,128 male and female undergraduates are reported. The separate items were examined from the point of view of sex, cultural and socioeconomic factors which might appertain to them and also of their interrelationship to each other and to the measure computed from them all. Criteria derived from these considerations were then applied to eliminate 10 of the original 20 items and results recomputed to provide frequency-distribution and cumulative frequency functions and a revised item-analysis. The difference of incidence of handedness between the sexes is discussed (French & German summaries) *Journal abstract*

V. **Formirovanie i razvitiye osnovnykh svoistv tipa vysshei nervnoi deyatel'nosti v ontogeneze.** [Formation and development of basic types of higher nervous activity in ontogenesis.] *USSR Naukova Dumka*, 1971, 1 R., 70 K.

8234. Tuckov, B. S. & Borisova, N. L. (Leningrad State U., USSR) **Opyt ispol'zovaniya predmetnykh diafragm (blend) pri elektronnomikroskopicheskom issledovanii osobykh uchastkov nervnykh struktur.** [Experience with using object diaphragms in electron microscopic studies of special parts of nervous structures.] *Nervnaya Sistema*, 1969(Dec), No. 10, 172-176.—Proposes a procedure which introduces considerable economy of time and effort in locating the parts of nervous tissue to be investigated. 2 examples are considered: (a) locating the giant nerve cells in the ganglion of the leech, and (b) locating Ranvier's node. —*I. D. London.*

8235. Vetyukov, I. A. (Leningrad State U., USSR) **Vliyaniye prodolzhitel'nogo razdrazheniya chuvstvitel'nykh nerva porogovoy sily i nekotorykh faktorov na skorost' razvitiya dominantly i isteriozisa.** [Influence of prolonged threshold stimulation of the sensitive nerve and of some factors upon the rate of development of the dominant and hysteresis.] *Nervnaya Sistema*, 1969(Dec), No. 10, 16-19. Prepared frogs were *Ss* in a study to explain the significance of prolonged threshold stimulation of the sciatic nerve, heightened temperature, and other factors on the rate of development of (Ukhtomski's) dominant and on general convulsive movements of the type associated with strychnine poisoning (hysteresis). A decrease in the

functional activity of the CNS was shown to result from prolonged residence (18 days) in a common tank with external temperatures in the range of 19-23° C. In the beginning a decrease in the functional activity of the CNS was observed in response to weak reiterated 3-min stimulations of the sciatic nerve plexus. After 40-45 min., against a background of continuous stimulation of the sinistral sciatic nerve, a sharp enhancement of excitability took place in response to 3-min stimulation of the sciatic nerve plexus; hysteresis occurred at 20-min intervals. After 1½ hr., in response to the same stimuli enhanced excitability of the CNS was replaced by processes of inhibition.—*I. D. London.*

Neuroanatomy

8236. Pandya, Deepak N. & Vignolo, Luigi A. (Boston City Hosp. Harvard Neurological Unit, Mass.) **Intra- and interhemispheric projections of the precentral, premotor and arcuate areas in the rhesus monkey.** *Brain Research*, 1971 Vol. 26(2), 217-233.—Studied the intra- and interhemispheric connections of various parts of the precentral gyrus and rostrally adjacent frontal areas with silver impregnation techniques in 12 rhesus monkeys. The subdivisions of the precentral motor area (MI) were found to be connected ipsilaterally in a topographic manner with the premotor area (MII), primary somatosensory area (SI), and the 2nd sensory area (SII). The areas in MI representing the hand and foot do not project to the opposite hemisphere whereas face, trunk, and limb-girdle areas do so, and their projections are directed to both homotopical and nonhomotopical areas, including topographic projections to MII. These nonhomotopical projections form an arch anterior to the projection-free hand and foot areas representing the dorsal aspect of the body from face to occiput and from thoracolumbar to sacral segment of the trunk. The premotor and arcuate regions can be differentiated on the basis of their intrahemispheric connectivity. Likewise, the interhemispheric connections of the premotor areas and the arcuate areas are mainly found in the homotopic regions except for a small area above the caudal tip of the principal sulcus. The nonhomotopic projection of the premotor areas are directed MII, MIII, and prefrontal cortex, whereas those from the arcuate areas are observed in the prefrontal cortex only. The possible significance of these projections is discussed (29 ref.) *Journal summary.*

8237. Welker, Carol. (Central Wisconsin Colony & Training School, Madison) **Microelectrode delineation of fine grain somatotopic organization of SI cerebral neocortex in albino rat.** *Brain Research*, 1971, Vol. 26(2), 259-275. Microelectrode recording, systematic mapping, and cytoarchitectural techniques were combined to determine fine details in the patterns of somatic sensory projections from mystacial vibrissae, and other body regions, to SMI of the rat. Single unit and unit-cluster responses to delicate mechanical stimuli were recorded in as many as 27 penetrations/sq. mm in *Ss* anesthetized with pentobarbital sodium. Somatic sensory afferents from 1/4 of the body were found to project contralaterally to a 45 sq. mm cortical area. About 2/3 of this area received projections from very small receptive fields on the head which usually consisted of either single large vibrissae on the lateral face or smaller sinus hairs on the rostral face. The relative spatial relationships of the cortical projections

from all the vibrissae were identical to their spatial relationships on the body surface. There was no overlap between projections from any vibrissae. The physiological boundaries of Sml coincided with a cytoarchitectural area which exhibited a prominent granular IVth layer. Distinct multicellular aggregates were found within Layer IV of the facial sinus hair area. The location of these aggregates, their number (which was similar to the number of facial sinus hairs), and their somatotopic arrangement suggested the hypothesis that each aggregate is a functional unit which receives somatic sensory information from a single, specific sinus hair. (22 ref.)—*Journal summary*.

8238. Wimer, Cynthia C., Wimer, Richard E., & Roderick, Thomas H. (City of Hope National Medical Center, Duarte, Calif.) **Some behavioral differences associated with relative size of hippocampus in the mouse.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 57-65.—Tested 54 male and female randomly bred mice with naturally varying hippocampal size for (a) open-field activity, (b) active shock-escape and passive shock-avoidance conditioning, and (c) stimulus- and response-discrimination learning and reversal. The ratio of hippocampal volume to total forebrain volume was negatively related to open-field activity and positively related to passive-avoidance conditioning performance. Other neuroanatomical measures were examined, and a significant positive relation, independent of the negative correlation with hippocampus, was found between open-field activity and relative volume of neocortex. Results are compared with those from studies evaluating behavioral effects of hippocampal lesions.—*Journal abstract*.

LESIONS

8239. Larsson, Knut & Sedin, Göran. (U. Göteborg, Sweden) **The sexual behavior of male rats after bilateral section of the hypogastric nerve and removal of the accessory genital glands.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 251-253.—Studied the sexual behavior of 19 male Wistar rats after bilateral section of the hypogastric nerve alone or in combination with removal of the seminal vesicles, the coagulating glands, and the ventral lobes of the prostate. With exception of a slight increase in number of mounts no changes in the mating pattern were observed following either operation. It is concluded that neither sympathetic smooth muscle innervation of the accessory genital organs, nor afferent influences from the seminal vesicles and the ventral lobes of the prostate are necessary for normal mating behavior of the male rat. (18 ref.)—*Journal abstract*.

8240. Lund, R. D. & Lund, J. S. (U. Washington, Medical School) **Synaptic adjustment after deafferentation of the superior colliculus of the rat.** *Science*, 1971(Feb), Vol. 171(3973), 804-807.—Removed eyes from rats shortly after birth, when there are few formed synapses in the colliculus. It was found that synaptogenesis continued to give a near-normal ratio of terminals containing either spheroidal or flattened vesicles. After eye removal in adult Ss, however, reinvasion of synaptic sites vacated by degenerate optic terminals occurred, with an incomplete return toward a normal proportion of synaptic types.—*Journal abstract*.

8241. Snider, Nancy; Marquis, Hugh A., Black, Manual, & Suboski, Milton D. (Queen's U., Kingston,

Ontario, Canada) **Adrenal corticosteroids and the Kamin effect.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 309-310.—Adrenalectomy and dexamethasone blocking of ACTH release in 42 male albino adrenalectomized and 42 sham-operated rats did not affect time-dependent changes in performance following discriminated avoidance conditioning. Adrenalectomized Ss also yielded the U shaped intersession interval function characteristic of the Kamin effect in shuttlebox conditioning. The use of Sprague-Dawley rats precluded the possibility that time-dependent performance changes following aversive conditioning in adrenalectomized Ss was the product of postoperatively developed accessory adrenal tissue. The Kamin effect occurs independently of pituitary-adrenal function.—*Journal abstract*.

Brain Lesions

8242. Alexinsky, T., Delacour, J., & Libouban, S. (National Center of Scientific Research, Paris, France) **Thalamus et conditionnement défensif: Importance relative de trois structures médianes.** [Thalamus and defensive conditioning: Relative importance of the three medial structures.] *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 439-446.—Studied the role played by the nucleus dorsalis medialis (DM), centrum medianum (CM), and pretectalis (Pt) upon the defensive active conditioning in 200 Wistar albino rats. The level of avoidance responses reacquisition was compared after electrolytic lesions of the different structures. A 2-way shuttle box test was used with a light or tone as CS. The most important impairment was due to CM lesions without any specific relation to CS. Deficits obtained after Pt lesions were less severe though more noticeable with light. Even extensive DM lesions did not produce any effect on this test. (French summary) (36 ref.)—*English abstract*.

8243. Anderson, Kenneth V. & Mahan, Parker E. (Emory U.) **Increased pain thresholds following combined lesions of thalamic nuclei centrum medianum and centralis lateralis.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 113-114. Trained 8 adult cats to escape from footshock in a shuttlebox. Current applied to the feet was varied in ascending and descending sequences for each S according to the psychophysical method of limits, and each S was trained until stable thresholds for escape responding were achieved. Ss then had bilateral lesions made in thalamic nuclei centrum medianum and centralis lateralis, were given 8 days to recuperate, and were retrained to a stable level of escape responding. Results show that aversive thresholds were significantly elevated for all Ss for up to 90 days following thalamic lesions, indicating that the midline thalamus plays a role in the perception of pain derived from footshock.—*Journal abstract*.

8244. Butters, Nelson; Pandya, Deepak; Sanders, Karen, & Dye, Patricia. (Veterans Administration Hosp., Boston, Mass.) **Behavioral deficits in monkeys after selective lesions within the middle third of sulcus principalis.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 8-14. Tested 14 rhesus monkeys with lesions limited to the superior and/or inferior banks of the middle 3rd of sulcus principalis on retention of 5-sec spatial delayed alternation and place reversal. Ablations of the superior or inferior banks had no consistent behavioral effects, while lesions which involved both banks, either in the depths

or superficial regions of the sulcus, resulted in deficits on both spatial tasks. Ss that failed to relearn delayed alternation also evidenced deficits on place reversal. Findings suggest that both tasks involved a common factor mediated by cortex within the middle 3rd of the sulcus. *Journal abstract.*

8245. Craddock, Samuel N. & Thompson, Robert. (Louisiana State U.) A discrete interpedunculo-central tegmental region critical for retention of visual discrimination habits in the white rat. *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 39-50. In Exp. 1 22 male albino Wistar rats were assigned to a normal control or 1 of 4 experimental groups sustaining electrolytic lesions at different levels of the midline tegmentum following learning of a brightness and pattern discrimination problem. The group with lesions destroying the caudal part of the interpeduncular nucleus and/or the overlying decussations of the brachium conjunctivum showed losses in retention, while the remaining groups having lesions anterior or posterior to these structures exhibited excellent retention. Exp. II with 15 Ss showed that severance of the decussating fibers of the brachium conjunctivum by means of an ophthalmic knife also led to retention deficits. Results indicate that dysfunction of the red nuclei may underlie visual discrimination losses following midline tegmental damage. (21 ref.) *Journal abstract.*

8246. Cranford, J., Ravizza, R., Diamond, I. T., & Whitfield, I. C. (Duke U.) Unilateral ablation of the auditory cortex in the cat impairs complex sound localization. *Science*, 1971(Apr), Vol. 172(3980), 286-288. In an experiment with 8 cats it was found that unilateral ablation of the auditory cortex resulted in a profound deficit in attending to stimuli on the side contralateral to the lesion. The deficit was also manifested in an abnormal perception of left-right pulse pairs when the pulse which led by a few msec was contralateral to the damaged hemisphere. *Journal abstract.*

8247. Dąbrowska, Jadwiga. (Nencki Inst. of Experimental Biology, Warsaw, Poland) Dissociation of impairment after lateral and medial prefrontal lesions in dogs. *Science*, 1971(Mar), Vol. 171(3925), 1037-1038. Trained 16 naive mongrel dogs before operation on a go, no-go test with symmetrical reinforcement. Lesions situated on the medial surface of the prefrontal cortex caused slight or no impairment in retention, whereas removal of the lateral prefrontal cortex induced severe and long-lasting impairment. The lateral prefrontal cortex is probably related to selection of the proper instrumental responses to corresponding stimuli. *Journal abstract.*

8248. Denisova, A. S. (Pavlov Inst. of Physiology, Leningrad, USSR) O roli golovki khvostatykh yader v uslovno-reflektornoi deyatelnosti sobak. [On the role of the head of the caudate nuclei in conditioned reflex activity in dogs.] *Zhurnal Vyssheĭ Nervnoi Deyatelnosti*, 1970(Sep), Vol. 20(5), 947-954. 4 Ss were used in a study to elucidate the mechanisms involved in CR activity after electrocoagulation of the head of the caudate nuclei, utilizing previously elaborated motor-alimentary CRs to acoustic and photic stimuli. Lesion of the head of the caudate nuclei produced: (a) disturbance of "active choice" in seeking the proper direction for alimentary reinforcement, (b) decrease in the magnitude of the salivary CRs, (c) disinhibition of the secretory and motor components of the alimentary reaction to the differential stimulus, and (d) increase in the UCRs and

salivation in the intervals between stimuli. It is suggested that the head of the caudate nuclei, thanks to the CR and UCR character of the inhibitory influences, participates in the stabilization of CR signals and also promotes the stabilization of conditioned reactions. (English summary) (24 ref.) *Journal abstract.*

8249. Eddy, D. R., Bremner, F. J., & Thomas, A. A. (Trinity U.) Identification of the precursors of hippocampal theta rhythm: A replication and extension. *Neurobiology*, 1971(Mar), Vol. 9(1), 43-50. Utilized a microprobe to modify the functioning of the septal nucleus of 5 cats. A change in reticular formation induced hippocampal theta rhythm resulted 5 cats. Ss sustaining electrolytic lesions in the septum showed a similar effect. Changes in hippocampal EEG patterns, resulting from electrical stimulation of the reticular formation combined with cryogenic cooling of the septum suggest that the reticular formation may be mainly responsible for the 4-5 Hz. frequencies in the hippocampal theta. (French & German summaries) (21 ref.) *Journal abstract.*

8250. Ellen, Paul & Kelnhofer, Maria. (Georgia State U.) Discrimination of response feedback following septal lesions. *Psychonomic Science*, 1971(Apr), Vol. 23(1B), 94-96. Required 10 experimentally naive male Long Evans hooded rats in a 2-bar operant task to make 5 consecutive responses on 1 bar (count bar) and then press the food bar once for reinforcement. Shifts to the food bar before the required count had been completed on the count bar did not lead to reinforcement but reset the counter such that the required sequence had to be started again. 5 septally lesioned Ss were deficient in learning when to shift to the food bar. Results are interpreted in terms of a deficiency in the discrimination of response-produced feedback. *Journal abstract.*

8251. Fibiger, Hans C. & Campbell, Byron A. (Princeton U.) Effect of adrenal demedullation on starvation-induced behavioral arousal. *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 403-405. Tested the hypothesis that starvation-induced behavioral arousal results from the release of catecholamines from the adrenal medulla and their subsequent action on the reticular activating system. 44 normal and adrenal-demedullated male Sprague-Dawley rats were adapted to stabilimeter and running wheel activity cages and then terminally deprived of food. Both normal and demedullated Ss became hyperactive during starvation. In the running wheels however the hyperactive response to food deprivation was significantly attenuated. Results indicate that hunger-induced arousal is at best only partially mediated by the excitatory action of adrenal-released catecholamines on the CNS. (21 ref.) *Journal abstract.*

8252. Flaherty, Charles F. & Hamilton, Leonard W. (Rutgers State U.) Responsivity to decreasing sucrose concentrations following septal lesions in the rat. *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 431-437. Examined the effect of septal lesions in 24 male Holtzman albino rats on consummatory responding for sucrose in 2 experiments. It was found that the lesion did not prevent the occurrence of an abrupt decrement in consummatory responding subsequent to decrease in sucrose concentration. Results indicate that the opportunity for comparison among different concentrations may be an important factor in determining whether a septal rat licks more or less than a control for a given concentration of sucrose, and that septal rats are less

sensitive than controls to the postingestive consequences of sucrose intake. An incentive model of septal effects is discussed. (22 ref.)—*Journal abstract.*

8253. Gray, Jeffrey A. (Dept. of Experimental Psychology, Oxford, England) **Medial septal lesions, hippocampal theta rhythm and the control of vibrissal movement in the freely moving rat.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 189-197.—Recorded the electrical activity from the dorsomedial hippocampus in 20 freely moving male Sprague-Dawley rats via chronically implanted bipolar electrodes. Observations are reported on the occurrence of hippocampal theta rhythm, and changes in its frequency, amplitude, and regularity, during exploratory behavior, vibrissal movement, drinking, grooming, and fearful crouching. Lesions were produced in the medial septal area electrolytically via a 2nd chronically implanted electrode while S was freely moving. Data are reported on the resulting disruption of hippocampal theta rhythm for up to 7 wk. after the lesion. In some cases disruption of normal bilaterally synchronous and temporally regular vibrissal movement also resulted from the lesion, but this effect and the disturbance in theta rhythm were dissociable. (French summary) (20 ref.)—*Journal summary.*

8254. Gross, Charles G., Cowey, Alan, & Manning, Frederick J. (Princeton U.) **Further analysis of visual discrimination deficits following foveal prestriate and inferotemporal lesions in rhesus monkeys.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 1-7.—Compared the visual discrimination performance of 5 normal Ss, 5 Ss with inferotemporal lesions, and 4 Ss with foveal prestriate lesions. In Exp. I the inferotemporal group was impaired in learning object and color discriminations but the foveal prestriate group showed a deficit only on the object problems. The inferotemporal group showed impaired retention of color discrimination after interpolation of an object discrimination and impaired retention of object discrimination after interpolation of a color discrimination, but normal retention when the original and interpolated problems were both either object or color discriminations. Retention by the other groups was not affected by the type of interpolated material. In Exp. II only the foveal prestriate group was impaired on pattern discrimination when irrelevant stimuli were added. Results are discussed in terms of perceptual and associative learning disorders.—*Journal abstract.*

8255. Hamilton, Leonard W. & Flaherty, Charles F. (Rutgers State U.) **Behavioral patterns associated with water intake in normal and septal rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 165-174.—Observed 14 male Holtzman rats during a 1-hr period of access to water and food following 23 or 47 hr. of water deprivation. Sustained drinking lasted less than 6 min. followed by grooming. Within 10 min. following exposure to the water and after consuming approximately 3 ml/100 gm of body weight (about 60% of their total 1-hr intake), Ss began to eat. Data suggest that the inhibition of food intake (resulting from the need to defend the body water balance) was released very quickly following access to water. Septal lesions did not influence this form of inhibition, but produced more rapid adaptation to novel drinking situations as well as the usual enhancement of avoidance responding.—*Journal abstract.*

8256. Johnson, David A. (Ohio State U.) **Developmental aspects of recovery of function following infant septal lesions in the rat.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5665.

8257. Killackey, H. & Diamond, I. T. (Duke U.) **Visual attention in the tree shrew: An ablation study of the striate and extrastriate visual cortex.** *Science*, 1971(Feb), Vol. 171(3972), 696-699.—Describes an experiment with tree shrews (3 normal, 3 with removal of the striate cortex, and 3 with large lesions of the temporal area). Results indicate that removal of the striate area results in increased distractibility, which prevents the Ss from learning to discriminate form when hue is an irrelevant and distracting cue. Removal of the extrastriate visual cortex results in the reciprocal deficit: an increase in perseveration manifested by an inability to shift attention when irrelevant dimensions are made relevant.—*Journal abstract.*

8258. Lubar, Joel F. & Middaugh, Lawrence D. (U. Tennessee) **Avoidance conditioning in cats with striate and auditory cortex lesions and contrasting effects of peripheral blindness.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 26-30.—Compared 17 adult cats with lesions in the auditory and visual cortex with 7 normal controls in acquisition and relearning of a shuttle-avoidance task. The CS was a buzzer. It was found that Ss with lesions in the striate cortex were deficient in both the acquisition and the relearning tasks whereas Ss with auditory damage were not. The relearning task was tested under conditions where all Ss wore opaque contact occluders to produce peripheral blindness. Results (a) indicate that the avoidance deficit is specific to lesions of the visual cortex and persisted under conditions of peripheral blindness, and (b) imply that there is a complex dysfunction beyond that attributable to visual factors alone following striate ablation.—*Journal abstract.*

8259. Mabry, Paul D. (U. Mississippi) **Effect of septal lesions on response to frustrative nonreward.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5669.

8260. Meier, R. (U. Zurich, Inst. für Hirnforschung, Switzerland) **Interhemispheric transfer of two-choice discrimination in commissurotomy pigeons.** *Psychologische Forschung*, 1971, Vol. 34(3), 220-245.—The role of avian commissural systems in interhemispheric transfer of monocularly learned visual discriminations was investigated in an instrumental conditioning situation (Skinner). Color and pattern (up-down and left-right mirror-images) were used as (supraoptic) stimuli. Stereotaxic lesions were placed in the supraoptic decussation of 21 pigeons, in the tectal and posterior commissures of 20 pigeons. In 11 animals all 3 connections were interrupted. All lesions were histologically verified. After section of the supraoptic decussation interhemispheric transfer was severely impaired for 1 color and 2 up-down mirror-image discriminations. No significant impairment in transfer for color, up-down and left-right mirror-image discriminations followed section of the tectal and posterior commissures. These data demonstrate that at least part of the supraoptic decussation is involved in interhemispheric transfer of visual information." R. Gunter.

8262. Mize, R. Ranney; Wetzel, Allan B., & Thompson, Venan E. (Northwestern U., Medical School) **Contour discrimination in the rat following removal of posterior neocortex.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 241-246.—Trained male Long-Evans hooded rats on 1 of 3 2-choice visual discrimination problems. The stimuli were equated for total luminous flux and black-white area, but differed in amount of contour, defined as total amount of black-white edge. The ratios of contour were 3:1, 4:1, or 5:1. Following acquisition of the problems, posterior neocortical ablations were sustained by at least 30 Ss in each group, the remainder serving as normal controls. When retested, controls retained the problem, while operated Ss were unable to relearn the 3:1 or 4:1 ratio problems. Operated Ss did relearn the 5:1 ratio contour problem although they required more than twice as many trials than during original learning. Results suggest that rats deprived of visual cortex can make visual discriminations based upon differences other than total luminous flux. Density distributions of light or stimulus differences in amounts of dark-light boundaries appear to be the likely parameters which, when large enough, permit discrimination of such problems. 8263. Murphree, Oddist D., Morgan, Paul N., & Jarman, Ruth V. (Veterans Administration Hosp., Little Rock, Ark.) **Learning deficits and activity changes: A partial laboratory model in postencephalitic rats for studies of brain damage.** *Conditional Reflex*, 1971(Jan), Vol. 6(1), 30-35.—8-21 day old rats were inoculated in the right cerebral hemisphere with St. Louis encephalitis virus, Japanese B encephalitis virus, and Murray Valley encephalitis virus. Mumps virus however, was injected at 1 day of age. Fatal encephalitis usually resulted in very young Ss. Ss injected at ages of more than 2 wk. showed little or no clinical signs of infection. When inoculated at ages between these extremes, clinical disease developed in most Ss but many survived. Physically most of these surviving Ss appeared to be normal, but when tested at maturity in a rather complex maze, they showed a marked reduction in learning ability. Tilting-cage-type activity measurements taken overnight with the Murray Valley encephalitis group also indicated that most of the postinfectious Ss were hyperactive. Implications for minimally brain-damaged children are discussed. *Journal summary*
8264. Nathan, Marc A. & Smith, O. A. (School of Aerospace Medicine, Brooks Air Force Base, San Antonio, Tex.) **Conditional cardiac and suppression responses after lesions in the dorsomedial thalamus of monkeys.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 66-73.—Compared 5 adult squirrel monkeys with bilateral damage of varying extent to the dorsomedial thalamus with 4 control monkeys with lesions in other neural areas. Ss showed postoperative (a) deficits in conditioned suppression but not conditional cardiac responses, and (b) decreases in intertrial lever-pressing rates. It is concluded that the postoperative decrease in conditioned suppression resulted from damage of a response system that normally produces conditioned suppression by interfering with lever pressing. The effect was not ascribed to a decrease in acquired fear because the conditional cardiac response remained unchanged. (19 ref.)—*Journal abstract*
8265. Paré, William P. (Veterans Administration Hosp., Perry Point, Md.) **Avoidance behavior in the rat following insular cortical lesions.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 21-23.—Trained 26 male Long-Evans rats with insular neocortical lesions, 2 sham-operated controls, and 11 normal controls on passive-avoidance problems. 2 problems included a food incentive, while the 3rd was devoid of any food incentive. Lesioned Ss showed a deficit in acquiring the passive-avoidance response on the food-related problems, but quickly adopted the avoidance response on the problem without the food incentive. Results are interpreted in terms of consummatory response inhibition.—*Journal abstract*
8266. Rose, James D., & Frommer, Gabriel P. (Emory U.) **Changes in trigeminal nucleus evoked potentials and behavioral responses elicited by trigeminal stimulation following septal lesions.** *Brain Research*, 1971, Vol. 26(1), 405-418.—Examined electrophysiological excitability changes in sensory pathways resulting from septal damage and compared them with changes in behavioral responsiveness to the same stimuli, using 11 rats with implanted electrodes. The predominant effect of septal lesions on the tract wave of the trigeminal nucleus evoked potential (TNEP) was an increased amplitude. Of the various changes noted in TNEPs following septal lesions, "amplitude alterations of the nucleus caudalis nuclear wave showed the closest temporal correspondence with behavioral changes." (Ningata U., Medical School, Japan) **On the changes of nystagmus caused by ultrasound-produced focal lesions in the MLF of the rabbit.** *Acta Oto-Laryngologica*, 1969(Dec), Vol. 68(6), 489-500.—Studied the changes of nystagmus caused by ultrasound-produced focal lesion in the median longitudinal fasciculus (MLF) of 25 rabbits. Results are summarized as follows: (a) a diminution of adducting movements on optokinetic and vestibular nystagmus was observed by destroying the MLF at the level of the rostral portion of IV ventricle, while a diminution of the abducting movements on vestibular nystagmus, on the contrary, was observed by destroying the MLF below the level of the trochlear nuclei; and (b) in 1 S, in which MLF was transected just below the level of the trochlear nuclei, the so-called convergence nystagmus was transiently observed. The difference between the present results and those of M. B. Bender and E. A. Weinstein seems to be due to the difference in species of the animals used. (German summary) (20 ref.)—*Journal abstract*
8270. Teitelbaum, Herman. (U. Maryland)

Lateralization of olfactory memory in the split-brain rat. *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 51-56.—Assigned 6 male Sprague-Dawley albino and 16 Long-Evans hooded rats to 1 of 3 groups—sham operated control, operated control, and operated experimental. It was found that interhemispheric transfer of olfactory discriminations was blocked by midline incisions damaging the corpus callosum, hippocampal commissure, and anterior commissure. Shallow incisions involving the corpus callosum and hippocampal commissure did not affect transfer. —*Journal abstract.*

8271. Thorne, B. Michael & Thompson, Robert. (Mississippi State U.) **The red nucleus and visual performance in the white rat: A methodological artifact?** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 86-87.—Trained 13 adult male Wistar albino rats in a Thompson-Bryant apparatus without a choice chamber. 8 Ss were then subjected to bilateral ventral midbrain lesions aimed at the red nucleus. Lesioned Ss were found to be deficient in visual discrimination performance. Results support previous work with rats and raise the possibility of a species difference in functional significance of the red nucleus between white rats and rhesus monkeys. —*Journal abstract.*

Georgia) **Disruption of a radiation-induced preference shift by hippocampal lesions.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 283-285.—Compared saccharin preferences of 10 male Sprague-Dawley rats with extensive hippocampal lesions and 10 control Ss (5 normal and 5 in which the cerebral cortex overlying the

hippocampus had been removed). In contrast to controls, Ss continued to exhibit a strong preference for a saccharin solution after saccharin ingestion was paired with exposure to low level X-irradiation. Results suggest that the hippocampus partially mediates the motivational consequences of exposure to X-radiation. —*Journal abstract.*

8277. Panksepp, Jaak. (U. Sussex, Lab. of Experimental Psychology, England) **Effects of hypothalamic lesions on mouse-killing and shock-induced fighting in rats.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 311-316.—Studied home-cage mouse-killing and reflexive-fighting in 24 male albino rats before and after medial and lateral hypothalamic lesions. Both forms of aggression were intensified by medial damage and attenuated by lateral hypothalamic lesions. The failure to find differential lesion effects on the different modes of aggression is taken as evidence that (a) relatively nonspecific facilitatory (or motor) influences from the lateral hypothalamus, and (b) inhibitory influences from the medial hypothalamus modulate both predatory aggression and reflexive-fighting. (17 ref.) —*Journal abstract.*

8278. Pigareva, M. L. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Oblegchenie uslovnoreflektornogo pereklyucheniya raznorodnykh uslovykh relleksov u krya posle povrezhdeniya gippokampa.** [Facilitation of conditioned reflex switchover of dissimilar conditioned reflexes in rats after hippocampal lesion.] *Zhurnal Vysshe Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 932-940.—Ss were 7 intact and 8 prepared rats (hippocampal electrocoagulation). In the morning (8 AM to 12 PM) an alimentary-motor CR to light was formed and stabilized in 3 intact and 4 prepared Ss, followed by the formation of a motor electrodefensive CR to sound; in the remaining Ss the CRs were formed in reverse order. After 15-25 experimental days, the stimuli were given other signal significance in the night (8-11 PM)—sound became an alimentary signal, light a defensive signal. Hippocampal lesion produced a significant increase in the number of intersignal reactions and spontaneous jumping from 1/2 of the experimental chamber to the other. In prepared Ss the rate of elaborating an alimentary CR was the same as in intact Ss, but the rate for the defensive CR exceeded that in the latter. In contrast to the situation with intact Ss, formation of the 2nd CR connection in prepared Ss was accompanied very little by antagonistic relationships between alimentary and defensive activity. In prepared Ss a stable double switchover was elaborated in 3-6 experimental sessions, whereas in intact Ss such switchover failed in the course of 30 or more sessions. After hippocampal lesion it became possible for 5 of the intact Ss. Prior to the operation, these Ss displayed a generalized defensive reaction or severe neurotic disturbances. (English summary) (26 ref.) —*J. D. London.*

8279. Smith, Donald F., Balagura, Saul, & Lubran, Myer. (U. Chicago) **Antidotal thirst and lithium excretion in rats with hypothalamic lesions.** *Psychology & Behavior*, 1971(Mar), Vol. 6(3), 209-213.—Assigned 21 male albino Sprague-Dawley rats to receive (a) lateral hypothalamic (LH) lesions, (b) ventromedial hypothalamic (VMH) lesions, or (c) sham operations (SO). SO and VMH Ss increased their water intake in response to a dilute lithium chloride stomach load. LH Ss failed to drink, suggesting that the lateral hypothalamus is essential for the occurrence of antidotal

thirst. The renal elimination of a dilute saline stomach load by LH Ss was similar to that of SO Ss, but VMH Ss excreted more of a less concentrated urine. The renal elimination of lithium was also altered in VMH Ss. The possible influence of adrenocortical function on the elimination of salt loads by rats with hypothalamic lesions is discussed. (27 ref.) *Journal abstract.*

8280. Wolf, George. (Mt. Sinai School of Medicine, New York, N.Y.) **Neural mechanisms for sodium appetite: Hypothalamus positive-hypothalamofugal pathways negative.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 381-389.—Reports on previous studies which have shown that lesions of the lateral or ventromedial hypothalamus impair sodium appetite while lesions of the anterior or posterior medial forebrain bundle or periventricular system which carry hypothalamofugal fibers have no observable effect. In the present study with 39 male Sprague-Dawley rats, other known or potential hypothalamofugal pathways were disjointed with no observable effect upon sodium appetite. Lateral hypothalamic lesions completely abolished sodium appetite under the same experimental conditions. It is concluded that no single neural pathway is necessary for transmission of hypothalamic natriorectic functions. Observations on disturbances of feeding behavior following certain subthalamic lesions are described. Motor and motivational functions of the subthalamus and hypothalamus are discussed. (48 ref.) *Journal abstract.*

BRAIN STIMULATION

8281. Gorgiladze, G. I. & Kazanskaya, G. S. **Dinamika nistagmennoi reaktsii glaz, EEG i nekotorykh drugikh pokazatelei pri povtornom kratkovremennom kaloricheskom razdrazhenii labirintov u krolikov.** [Study of changes in the nystagmus, electroencephalograph and autonomic symptoms during repeated short caloric stimulation of the rabbit labyrinths.] *Fiziologicheskii Zhurnal SSSR*, 1971(Jan), Vol. 57(1), 45-51.—Studied the habituation process of rabbits to short monaural caloric stimulation of the labyrinth. Ss were divided into 2 groups: the 1st requiring 14-20 irrigations to develop habituation; the 2nd group showing habituation after 70-90 irrigations. Bipolar electrodes were attached to the cranium to measure the evoked potentials. Irrigation water was of 20° C, 5 ml/2 sec. The values measured were: nystagmic eye reaction, EEG, general arterial pressure, frequency of breathing, and pulse. Parameters pertaining to nystagmic reaction were: latent period, duration of reaction, total number of nystagmic strokes, duration and speed of the slow phase habituation. The possibility of transferring habituation to the contralateral labyrinth and preserving the old one was demonstrated. Arterial pressure decreased after the 1st few irrigations and afterwards was gradually restored to the original value. It is suggested that the reticular formation of the CNS plays a primary role in the development of habituation. —I. Halev.

8282. Lipton, James M. (U. Texas, Medical School, Dallas) **Thermal stimulation of the medulla alters behavioral temperature regulation.** *Brain Research*, 1971, Vol. 26(2), 439-442.—Trained 6 rats with stereotactically implanted thermodes in the medullar caudal pons (MP) region to perform a thermal regulation task involving heat escape and heat reinforcement series.

It is shown that the urge to vary the uptake of heat from the environment was altered when the temperature in the rostral MP region was varied. It appears that the medullar region was sensitive to heat and cold and that this sensitivity contributed to thermoregulatory motivation. (20 ref.) *P. Hertzberg.*

8283. Plotkin, H. C. & Russell, I. Steele. (University Coll., Medical Research Council Unit on Neural Mechanisms of Behaviour, London, England) **Unilateral cortical spreading depression and escape learning.** *Physiologia Bohemoslovaca*, 1969, Vol. 18(5-6), 393-399.—Computed the learning of an escape response by 20 male hooded rats with unilateral cortical spreading depression and 20 controls. A significant hemidecorticate learning deficit was found, though no differences in savings over days could be found. The nature of the impairment appeared to derive from both a deficiency in information pick-up, and a loss of behavioral stability. The hemidecorticate deficit on escape learning appeared similar to that previously analyzed for avoidance learning. It is concluded that the impairment is a function of learning paradigm and that the effects of task difficulty require further study. No evidence was found to indicate a dominant hemisphere for learning in the rat. *Journal summary.*

Chemical Stimulation

8284. Burešová, Olga & Bureš, J. (Czechoslovak Academy of Sciences, Inst. of Physiology, Prague) **The effect of prolonged cortical spreading depression on consolidation of visual engrams in rats.** *Psychopharmacologia*, 1971, Vol. 20(1), 57-65.—Examined the effect of prolonged cortical spreading depression (PCSD) on the retention of a visual discrimination in 213 hooded rats. PCSD was maintained for 5 hr. by repeated application of 25% KCl onto the exposed cortical surface. Behavioral tests were performed 24 or more hr before and/or after the treatment. A single application of 25% KCl did not affect subsequent acquisition of a horizontal-vertical discrimination, the learning of which took 140 and 125% to-criterion trials 1 and 3 days after PCSD. Whereas a single application of 25% KCl did not impair retention of the pattern discrimination learned in a single session 24 hr. earlier, PCSD caused severe amnesia under the above conditions and partial amnesia even for pattern discriminations overlearned in 3 sessions. The amnesic effect nearly disappeared, however, when the habit was overlearned for 14 days, or when the engram established in a single session was allowed to consolidate for 2 wk. When PCSD was applied 24 hr. after a single learning session amnesia was more marked on the 3rd day after treatment, and retrieval hardly improved over 2 wk. In an experiment in which 14 sessions of black-white discrimination training were followed by a single session of horizontal-vertical training, PCSD evoked 24 hr. after acquisition of the pattern discrimination caused complete amnesia for the latter habit without affecting retrieval of the former one. The relevance of these findings to the consolidation hypothesis is discussed. (17 ref.)—*Journal abstract.*

8285. Daniels, D. (U. Exeter, Washington Singer Lab., Devon, England) **Acquisition, storage, and recall of memory for brightness discrimination by rats following intracerebral infusion of acetoxycycloheximide.** *Journal of Comparative & Physiological*

Psychology, 1971(Jun), Vol. 76(1), 110-118.—Injected acetylcycloheximide (ACXH), a protein synthesis inhibitor, and/or physiological saline, into the hippocampi of 96 unrestrained male hooded Wistar rats through 2 cannulas. Injections were made 5 hr. before introduction to a Y maze (shock motivated, brightness discrimination). Memory was severely impaired at 6 hr., 24 hr., and 7 days, but not at 3 hr. after acquisition. The ACXH had no "state-dependent" effect. When injections were given 5 hr. before the recall tests or immediately after acquisition, memory was unimpaired. Results from 4 experiments indicate that (a) there are 2 memory systems, (b) brain protein synthesis is necessary for establishment but not for the recall of long-term memory, and (c) activity in both short- and long-term systems is initiated during acquisition. The 2 memory systems appear to run in parallel rather than in series. (18 ref.)—*Journal abstracts*.

8286. Ferguson, John H. & Jasper, Herbert H. (Case Western Reserve U., University Hosp., Div. of Neurology) **Laminar DC studies of acetylcholine-activated epileptiform discharge in cerebral cortex.** *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 377-390.—Studied epileptiform paroxysms induced by local application of neostigmine and acetylcholine (ACh) to intact and undercut cerebral cortex in 39 adult cats. DC recording of electrical activity from the cortical surface together with a penetrating microelectrode were used to plot the field potentials in depth and to obtain extracellular records of associated unit discharge. Each spontaneous paroxysm was initiated by a sudden surface negative DC shift upon which was superimposed regular rhythmic oscillating waves. The surface negative DC field potential did not show a phase reversal except deep in the Vth layer and increased in negativity with a maximum in the vicinity of large pyramidal cells. The rhythmic oscillating waves only showed a phase reversal in the most superficial cortical layers. Rapid unit discharge of deep pyramidal cells accompanied the negative DC shift in intact cortex and was interrupted by gating or inhibitory action of rhythmic waves. ACh paroxysms induced in acutely undercut cortex were not accompanied by detectable unit discharge. It is suggested that neuronal depolarization and possibly glial cells may play a role in the generation of the DC shifts of the ACh paroxysm. (French summary) (29 ref.)—*Journal summary*.

8287. Gutman, Yehuda; Chaimovitz, Moshe; Bergmann, Felix, & Zerachia, Avi. (Hebrew U., Hadassah Medical School, Jerusalem, Israel) **Hypothalamic implantation of ouabain and electrolyte excretion: Evidence for central effect on sodium balance.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 399-401.—Conducted a series of experiments with a total of 116 male Hebrew University rats. It was found that (a) sodium excretion was markedly increased following implantation of ouabain in the lateral hypothalamus; (b) a small but significant increase in sodium excretion was produced by implantation in the medial hypothalamus; and (c) potassium excretion urine was not significantly affected by implantation. Following bilateral adrenalectomy, implantation did not affect sodium excretion or the ratio potassium/sodium. The possibility of suppression of mineralocorticoid secretion by ouabain implantation in the hypothalamus is discussed.—*Journal abstracts*.

8288. Krip, Gordon & Vazquez, Alfredo J. (U. Manitoba, Faculty of Medicine, Winnipeg, Canada) **Effects of diphenylhydantoin and cholinergic agents on the neuronally isolated cerebral cortex.** *Electroencephalography and Clinical Neurophysiology*, 1971(May), Vol. 30(5), 391-398.—Studied the interactions between antiepileptic agents (diphenylhydantoin, trimethadione, and ethosuximide), scopolamine, and pilocarpine. The ability of antiepileptic agents alone and in combination with cholinergic drugs to suppress prolonged epileptiform after-discharges was evaluated in chronically neuronally isolated slabs of cerebral cortex in the suprasylvian gyrus of unanesthetized, unrestrained cats. Diphenylhydantoin (DPH) decreased duration of after-discharges; trimethadione and ethosuximide did not. This effect was evident within 15 min after injection and was proportional to the dose. There was a mutual antagonism between DPH and scopolamine. No interactions were observed between cholinergic drugs and anti-petit mal agents. Results suggest that (a) the chronically isolated cortical slab may be a model for grand mal epilepsy, and (b) the anticonvulsant action of DPH may be exerted through cholinergic muscarinic inhibitory sites. (French summary) (35 ref.)—*Journal summary*.

8289. Milner, Joel S., Nance, Dwight M., & Sheer, Daniel E. (Lafayette Clinic, Detroit, Mich.) **Effects of hypothalamic and amygdaloid chemical stimulation on appetitive behavior in the cat.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 25-26.—Chronically implanted 16 adult cats unilaterally with cannulae in the preoptic and anterior hypothalamus and basolateral amygdala. Adrenergic and cholinergic drug stimulation with norepinephrine and carbachol, respectively, produced significant dose-dependent blockage of both food and water intakes. Results are contrasted with other studies which report that the cat does not show changes in patterns of feeding and drinking following hypothalamic and limbic chemical stimulation. (19 ref.)—*Journal abstracts*.

8290. Nance, Dwight M., Milner, Joel S., & Sheer, Daniel E. (Worcester Foundation for Experimental Biology, Shrewsbury, Mass.) **Hypothalamic anticholinergic inhibition of eating and drinking in the cat.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 26-28.—Unilaterally implanted 6 adult mongrel cats with cannulae in laterally implanted 6 adult mongrel cats with cannulae in the anterior and preoptic hypothalamus. Injections of 3 the anterior and preoptic hypothalamus. Injections of 3 concentrations of atropine sulfate resulted in a dose-related decrease in food and water intake. Water intake was more effectively inhibited by atropine than was food intake, which was suppressed only at the highest concentration employed. Results are interpreted as consistent with behavioral effects of hypothalamic lesions and somewhat less related to "chemically coded" behaviors in the cat. (15 ref.)—*Journal abstracts*.

8291. Spehlmann, Rainer. (Veterans Administration Research Hosp., Chicago, Ill.) **Acetylcholine and the synaptic transmission of non-specific impulses to the visual cortex.** *Braun*, 1971, Vol. 94(1), 139-150.—In *encéphale isolé* cats acetylcholine (ACh) and atropine were applied via multibarrel electrodes to single visual cortex cells being driven by stimulation of the reticular formation or other areas. ACh facilitated the response to reticular stimulation in 30% of the cells giving such a response. Atropine blocked the effect of reticular stimuli in most of these cells and blocked the reticular

facilitation of other input on some neurons suggesting that intrinsic ACh may function as the synaptic transmitter for reticular input to visual cortex cells. —W. A. Wilson.

8292. Spehlmann, Rainer; Daniels, James C., & Smathers, Clifford C. (Veterans Administration Research Hosp., Chicago, Ill.) **Acetylcholine and the synaptic transmission of specific impulses to the visual cortex.** *Brain*, 1971, Vol. 94(1), 125-138. —In encephale isole cats acetylcholine (ACh) and atropine were applied via multibarrelled microelectrodes to single visual cortex cells being driven by optic radiation shocks or retinal illumination. ACh increased spontaneous firing of about 20% of the neurons and facilitated responses to stimulation for some neurons; atropine antagonized the 1st effect but did not block responses to synaptic stimulation. "These results do not support the hypothesis of a cholinergic link in the transmission of specific impulses to neurons in the primary visual cortex of the cat." —W. A. Wilson.

Electrical Stimulation

8293. Asdourian, David & Preston, Robert J. (Wayne State U.) **Cerebellar stimulation as a CS.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 235-239. —Utilized electrical stimulation of the cerebellum of 61 Holtzman male albino rats as the CS in a 2-way avoidance task. The current level was at 10 μ A below the threshold for forced movement with the maximum level arbitrarily set at 400 μ A. Results indicate that stimulation of any area in the cerebellum can serve as an effective CS. —*Journal abstract*

8294. Bandler, Richard & Flynn, John P. (Yale U., Medical School) **Visual patterned reflex present during hypothalamically elicited attack.** *Science*, 1971(Feb), Vol. 171(3973), 817-818. —In an experiment with 5 cats, it was found that an S from which attack was elicited by electrical stimulation of the hypothalamus lunged more frequently toward a mouse presented to the eye contralateral to the stimulated site than it did to a mouse presented to the ipsilateral eye. This differential effect did not appear to be attributable to a temporary or permanent defect in the ipsilateral eye. —*Journal abstract*

8295. Darbellay, Donna W. & Winocur, Gordon. (Hope-Waddell Training Inst., Calbar, Nigeria) **Electroconvulsive shock, stress, and avoidance conditioning.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 46-47. —Assigned 63 naive male Wistar rats to 1 of 3 treatments: (a) 10 ECS treatments paired with a light CS, (b) 10 unpaired ECS treatments, and (c) no ECS. 7 Ss in each group were then assigned to light, tone, or no CS conditions for purposes of avoidance conditioning. Results show that ECS groups failed to show normal weight gain, while exhibiting greater amounts of urination and defecation during treatment. ECS-treated Ss also required a greater number of trials to reach criterion on the avoidance problem, an effect which was not related to specific CS pairing. It is concluded that the stressful effects of ECS were persistent and disruptive enough to restrict new learning in an aversive situation. —*Journal abstract*

8296. Fanardzhyan, V. V. & Papoyan, E. V. (Orbeli Inst. of Physiology, Erevan, USSR) **Elektrofiziologicheski analiz pishchedobivatel'nykh uslovykh reflektsov, obrazovannykh na razdrzhenie yader mozghechka**

u koshek. [Electrophysiological analysis of food-procuring conditioned reflexes, formed in response to stimulation of the cerebellar nuclei in cats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 982-991. —11 Ss were used to study food-procuring CRs formed in response to electrostimulation (6-8 and 300 impulses/sec) of the central cerebellar nuclei as CS. After elaboration of a well-stabilized positive CR, the recruitment potentials recorded in the cerebral cortex in response to low-frequency stimulation of the dentate or intermediate cerebellar nuclei, was rendered more complex by the addition of new components. When low-frequency stimulation of the same nuclei was utilized as a differential stimulus, the recruitment potentials recorded in the elaborated differentiation stage exhibited their initial form. The formation of positive and differential CRs to stimulation of the fastigial dentate and intermediate cerebellar nuclei along with subsequent double alteration of the signal significance of the CSs, is evidence for (a) the primary inhibitory influence of the cerebellum on the cerebral cortex through the nonspecific thalamic nuclei, and (b) its activating action on the cortex through the brainstem reticular formation. (English summary) (23 ref.) —J. D. London.

8297. Fishbein, William; McCaugh, James L., & Swarz, Jeffrey R. (City Coll., City U., New York) **Retrograde amnesia: Electroconvulsive shock effects after termination of rapid eye movement sleep deprivation.** *Science*, 1971(Apr), Vol. 172(3978), 80-82. —Results of an experiment with 226 naive Swiss Webster mice indicate that Ss that were deprived of REM sleep for 2 days immediately after 1-trial training in an inhibitory avoidance task, and given ECS after deprivation, displayed retrograde amnesia on a retention test given 24 hr later. ECS produced no amnesia in comparable groups of Ss that were not deprived of REM sleep. —*Journal abstract*

8298. Koffler, Sandra P. (Yeshiva U.) **The diencephalon of the amphibian brain: A neurobehavioral study.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5667.

8299. Kozlovskaya, M. M. & Val'dman, A. V. (1st Medical Inst., Leningrad, USSR) **Povedencheskie i elektroentsefalograficheskie reaktsii, vyzvannye stimulyatsiei medial'noi i lateral'noi septal'nykh zon krolika.** [Behavioral and electroencephalographic reactions, evoked by stimulation of the medial and lateral septal zones in the rabbit.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1022-1030. —32 Ss with chronically implanted electrodes were used to study the functional role of different parts of the septum by local electrostimulation of single nuclear structures and recordings of the behavioral and bioelectrical reactions arising with the gradual increase of stimulation. 2 radically different types of behavioral changes emerged: 3-min stimulation of the medial septal nuclei was accompanied by a "depression," characterized by a decrease in emotional reactivity, a decline of muscular tonus, and a reduced respiratory rate. Stimulation of the lateral septal nuclei caused "tension," manifested in an increase in muscular tonus and quickened respiration without depression of emotional behavior. During the development of "depression," both in the surface and deep structures of the brain, slow rhythmic high-voltage waves predominated. These waves were retained for several min. after stimulation was terminated. "Tension"

conditioning the rabbit nictitating membrane response. Results with 60 albino rabbits indicate that a 3 ma. ICCS could serve as a CS but elicited more nonassociative responding than an externally presented CS. Intensities of the ICCS as low as 17 ma. were found to be functionally little different from the 3 ma. ICCS while a .037 ma. CS produced significant levels of conditioned responding with few nonassociative responses. A .005 ma. CS appeared to be at or slightly below behavioral threshold. The adaptation level theory of CS intensity effects is partially supported by comparisons of within- and between-S effects. *Journal abstract*

8306. Putkonen, Pekka I. & Putkonen, Anna R. (U. Helsinki, Inst. of Physiology, Finland) **Suppression of paradoxical sleep (PS) following hypothalamic defence reactions in cats during normal conditions and recovery from PS deprivation.** *Brain Research*, 1971(Vol. 26(2)), 333-347.—Applied intermittent electrical stimulation of a lateral hypothalamic defense area in 7 chronically implanted cats for 5 hr in 10 experiments in normal laboratory conditions and in 7 experiments following a 3-day paradoxical sleep (PS) deprivation. After the defense sequence the states of vigilance were quantitatively recorded for 15-24 hr and compared with previously obtained controls from the same Ss. A significant reduction of PS was obtained in normal conditions (37% below 15-hr controls) and after PS deprivation (33% below 24-hr controls). The changes in wakefulness or slow-wave sleep were short lasting or insignificant. A well-established consequence of the type of stimulation used is a considerable drop in brain norepinephrine (NE) with little other effect on cerebral metabolites so far studied. Results are discussed in connection with the norepinephrine hypothesis of the control of emotional state and PS. The interpretation of the results favors the notion that NE is involved in the tonic phenomena of PS. (42 ref.) *Journal summary*

8307. Rossi, Ronald R., Brunner, Robert L., & Stutz, Robert M. (U. Cincinnati) **FS-ESB interaction rejected: A reply to Schwartzbaum and Gustafson.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 16.—Presents a reply to the criticism offered by J. Schwartzbaum and J. Gustafson (see PA, Vol. 44 20205) on a study by R. Brunner, R. Rossi, R. Stutz, and T. Roth (see PA, Vol. 44-9810). Schwartzbaum and Gustafson maintained that cross-talk between foot shock and electrical stimulation of the brain may have constituted an electrical artifact and could have accounted for the finding of retrograde amnesia. Procedures taken to prevent this artifact are reported. S. Knapp

8308. Sheard, Michael H. & Zolovick, Andrew J. (Yale U., Medical School) **Serotonin: Release in cat brain and cerebrospinal fluid on stimulation of midbrain raphe.** *Brain Research*, 1971(Vol. 26(2)), 455-458.—The effects of stimulation of the midbrain raphe in 12 male and 18 female cats, show that an increase of 5-hydroxyindoleacetic acid (5-HIAA) found in the brain and cerebrospinal fluid (CSF) correlates with specific electrode placements in the midbrain raphe region. This finding is considered to be further evidence that serotonin may "be released from specific nerve endings then broken down to 5-HIAA which subsequently diffuses into the CSF." (19 ref.)—P. Hertzberg

8309. Teyler, T. J., Roemer, R. A., & Thompson, R. F. (U. California, Irvine) **Relations between gross and unit evoked activity in pericruciate cortex of cat.**

Physiology & Behavior, 1971(Apr), Vol. 6(4), 329.—Studied simple and multiple units, both cell origin of pericruciate tract (PT), and unidentified units, relation to the evoked gross evoked potential to pericruciate stimulation in pericruciate association cortex of polymodal cats. Both PT and non-PT cells were duration on PT cells generate a near mirror image of initial component of the evoked association potential. Spike height analysis on multiple unit data show small and large units had the highest probability of firing on the maximum negative slope and maximum negativity, respectively, of the evoked potential. (2 ref.) *Journal abstract*

8310. Woodworth, Carol H. (U. Minnesota) **Attack elicited in rats by electrical stimulation of the lateral hypothalamus.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 345-351.—Elicited attack in 97 normally non-aggressive male Long-Evans rats by electrical stimulation of 53 points in the ventrolateral hypothalamus. Attack specifically tests disclosed (a) that live mice, dead mice, and juvenile rat pups were attacked with significantly greater frequency, shorter latency, and longer duration than adult rats of either sex or guinea pigs; (b) that attacks on live mice were more persistent than on dead mice. There was no evidence for olfactory inhibition of attack on rat pups. 10 out of 12 attack electrodes supported self-stimulation. Attack, alarm and an oral response group were elicited from anatomically differentiated areas. Results support the hypothesis that hypothalamic motivational responses are produced by multiple overlapping substrates, and not by a single undifferentiated substrate. (41 ref.) *Journal abstract*

ELECTRICAL ACTIVITY

8311. Adey, W. Ross. (U. California, Los Angeles) **Slow electrical phenomena in the central nervous system.** *Neurosciences Research Program Bulletin*, 1969(May), Vol. 7(2), 75-180.—Includes 15 short reports of a work session on slow electrical phenomena, which are defined to include perturbations in neuronal and neuroglia membrane potentials, and gradients that can be measured across domains of cerebral tissue. Reports are grouped under 4 headings: (a) correlates of cortical steady potentials, (b) substrates of electrical activity, (c) dendritic and other regional neuronal potentials, and (d) neural correlates of EEG wave activity. (18 p. ref.)—B. Preilowski

8312. Bloom, Floyd E., Iversen, Leslie L., & Schmitt, Francis O. (National Inst. of Mental Health, Lab. of Neuropharmacology, Washington, D.C.) **Macromolecules in synaptic function: A report based on an NRP work session.** *Neurosciences Research Program Bulletin*, 1970(Sep), Vol. 8(4), 325-455.—The work session was organized to discover whether there is hard evidence supporting the view that synaptic transmission involves not only small-molecule transmitters but also modulation or control of neuronal activity through release of macromolecules, or possibly through interaction of released material with macromolecules fixed in the synaptic structure. During the session the current directions of research on synaptic functions were examined by studying the various roles in which macromolecules might participate. The 4 main topics considered were: (a) ultrastructure, (b) storage and release mechanisms, (c) postsynaptic macromolecules.

and (d) transmitter regulation of postsynaptic metabolism. (26 p. ref.)—*U. Preilowski.*

8313. Boggan, William O., Freedman, Daniel X., Lovell, Richard A., & Schlesinger, Kurt. (U. Chicago) **Studies in audiogenic seizure susceptibility.** *Psychopharmacologia*, 1971, Vol. 20(1), 48-56.—Describes 2 experiments in which a genetically heterogeneous (HS) group of mice and a highly inbred strain of mice (C57BL/6) became highly susceptible to audiogenic seizures after exposure to acoustic stimulation (priming). In heterogeneous Ss the optimal age for priming was 18 days with a test-retest interval of 48 hr. The optimal test-retest interval in C57BL/6 Ss, primed at 20 days of age, was 8 days. 1 sec. of priming was found effective in enhancing seizure susceptibility. Drugs known to alter steady state levels of biogenic amines and to change responses of mice genetically predisposed to audiogenic seizures were found to be effective in altering seizure susceptibility from priming, but not effective in altering the priming itself.—*Journal abstract.*

8314. Carmeliet, J., Debecker, J., & Desmedt, John E. (U. Brussels, Brain Research Unit, Belgium) **A random interval generator using beta ray emission.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 354-356.—Describes a solid state generator of random intervals, based on a beta ray emitter. The instrument provides for independent control of the minimal interval between successive output pulses and of the dispersion of the random intervals. Uses of the generator for delivering sensory stimuli at random intervals or in random sequences are described. (French summary)—*Journal summary.*

8315. Glebova, N. F. & Danilova, L. I. (Petrozavodsk State U., USSR) **Vliyaniye perifericheskoi termoretseptsil na elektricheskuyu aktivnost' perednego gipotalamusa.** [Influence of peripheral thermoreception on electrical activity of the anterior hypothalamus.] *Fiziologicheskii Zhurnal SSSR*, 1970(Oct), Vol. 56(10), 1433-1437.—Urethanized rabbits were used to study the steady polarized potentials and summated electrical activity of the medial preoptic area of the anterior hypothalamus when the thermoreceptors of the skin and subcutaneous vessels were stimulated and the temperature of the brain remained unchanged. It was established that perfusion of the humorally isolated subcutaneous thoracic vein with the warm Ringer-Locke solution produced an increase in the electropositive character of the steady polarized potentials and synchronization of the electrohypothalamogram of the anterior hypothalamus. Perfusion of the vein with a cool solution produced a decrease in the positive value of the potential and desynchronization in the electrohypothalamogram. Placement of hot water bottle on the back induced a growth of electropositeness in the medial preoptic steady polarized potentials. (English summary) (17 ref.)—*I. D. London.*

8316. Goodman, David A. (U. California, Irvine) **Some brain reflexes of Necturus maculosus, the mud puppy.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5712.

8317. Hollis, John H. (U. Kansas, Parsons Research Center) **Effects of stimulus frequency on habituation: Patellar reflex.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 467-468.—Studied habituation and recovery of the patellar reflex in a 41-yr-old male human as a function of stimulus frequency, ranging from 10-60/min. Habituation occurred more rapidly and response decrement was greatest for higher frequencies with decline in amplitude

linear over much of its course. The decline in response amplitude was more pronounced for measures of force than for EMG.—*Journal abstract.*

8318. Lieblisch, Israel. (Hebrew U., Jerusalem, Israel) **Note on Thysell's "Reaction time of single motor units."** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 152.—Suggests that the lower mode reported in a study by R. V. Thysell (see PA, Vol. 44:3235) may represent the orienting response manifested by the single motor units to the onset of the reaction light. Internal data analysis is suggested to clarify whether the lower mode of the RT distributions was generated by responses, some of which have the character of the orienting response.—*P. Hertzberg.*

8319. Liesiene, V. (Kaunas Medical Inst., USSR) **Razlichie vysokochastotnoi chastli EKOg vo vremya fiziologicheskogo sna i bodrstvovaniya.** [Different high-frequency parts of the ECoG during physiological sleep and when awake.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1093-1095. 12 unrestrained cats were Ss in a study of: (a) average frequency of extrema in the electrocorticogram during rapid sleep, slow sleep, and when awake; and (b) the changes in average amplitude for the whole electrocorticogram spectrum. The results showed that differences in physiological states, as revealed in the average frequency of extrema, were related to changes in the activity of cortical neurons. This finding was confirmed by the direct data on neuronal activity in rapid and slow sleep, and the awake state in the visual and temporal cortex as well as in the lateral geniculate body and reticular formation. In the latter cases the average frequency of neuronal discharges changed parallel with the changes in the average frequency of extrema. *I. D. London.*

8320. Marczynski, T. J., Hackett, J. T., Sherry, C. J., & Allen, Sharon L. (U. Illinois, Medical Center, Chicago) **Diffuse light input and quality of reward determine the occurrence of "reward contingent positive variation" (RCPV) in cat.** *Brain Research*, 1971, Vol. 28(1), 57-70.—Investigated the effect of unpatterned light input on electrocorticogram patterns and epicortical light input on electrocorticogram patterns and epicortical steady potentials in cats trained to press a lever for milk reward. High voltage (120-200 μ V) bursts of postreinforcement synchronization with an average frequency of 7.8 cps were associated with epicortical positive steady potential shift, termed "reward contingent positive variation" (RCPV) and appeared over the striate, parastriate, and association cortex only in the presence of light in the test chamber, even though the Ss were trained without light. Visual perception of reward was not necessary for the occurrence of the postreinforcement synchronization, RCPV phenomena. It is postulated that diffuse light input supplies the "electromotive energy" for inhibitory mechanisms in cortical regions involved in processing of both visual and nonvisual input. (38 ref.) *Journal summary.*

8321. Mass, A. M. & Smirnov, G. D. (USSR Academy of Science, Inst. of Evolutionary Morphology & Ecology of Animals, Moscow) **Uchastie nespetlicheskoi sistemy stvola mozga i talamusa v kortikotalamicheskih vliyaniyakh.** [On the participation of talamic system of the brain stem and thalamus in the unspecific system of the brain stem and thalamus in the cortico-thalamic influences.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1673-1681. Recorded the slow negative wave in the lateral geniculate body and optic tract after stimulation of all dorsal cortical areas

just as after stimulation of the brainstem reticular formation and unspecific thalamic nuclei 1 rabbit anesthetized rabbits served as Ss. The investigation into the ways for initiation of this phenomenon suggest that the unspecific thalamic nuclei acted as a relay point for influences on the lateral geniculate body from the cortex and the brainstem reticular formation. (40 ref.)—*Journal summary*.

8322. Mayor, Huntington & Shiozawa, Ryochi. (Medical Center Hosp., DeGoesbrand Unit, Barrington, Vt.) **Antidromic digital and palmar nerve action potentials.** *Electroencephalography & Clinical Neurophysiology* 1971(Mar), Vol. 30(3), 210-221.—Measured the conduction velocities of antidromically propagated digital nerve action potentials along 2 segments of the arm for the median nerve in 21 normal Ss and for the ulnar nerve in 13 of these Ss. A proximal-distal gradient in conduction velocity with higher values for the more proximal nerve segment was observed. There was a significant decrease in the amplitude of the potential with increasing age. On stimulation of the ulnar or median nerve in the arm and recording with high gain, short latency preceded concomitantly recorded muscle action potentials in normal Ss and in 2 patients with selective slowing of conduction in motor nerves. Evidence is presented that these potentials are neural in origin and that as recorded from surface electrodes, they are antidromically conducted afferent nerve action potentials. Their usefulness in the measurement of afferent fiber conduction in certain patients is emphasized. (French summary)—*Journal summary*.

8323. Mayers, Kathleen S., Robertson, Richard I., Rubel, Edwin W., & Thompson, Richard F. (U. California, Irvine) **Development of polysensory responses in association cortex of kitten.** *Science* 1971(Mar), Vol. 171(3975), 1038-1040.—Investigated sensory responsiveness of single neurons in posterior association cortex of 34 7-50 day old kittens. The percentage of trimodal cells (i.e., cells that respond to visual, auditory, and somesthetic stimulation) increased gradually until Day 50, when percentages of trimodally responsive cells approached the adult level. In the youngest Ss, cells were predominantly responsive to only visual stimulation. With maturation, responsiveness to auditory and then to somesthetic stimulation was observed in increasing percentages of cells. (23 ref.)—*Journal abstract*.

8324. Metz, A. M. (Humboldt U., Inst. for Psychophysiology, Berlin, E. Germany) **Änderungen der myoelektrischen Aktivität während eines sensorimotorischen Lernprozesses.** [Changes of the process.] *Zeitschrift für Psychologie*, 1970, Vol. 178(1-2), 51-88.—Presents an experimental analysis for determining the progression of a sensorimotor learning process. The importance of this subject results from practical problems of industrial and sports psychology, especially in the framework of problems concerning aptitude diagnostics. EMG is regarded as the appropriate method for recording motor efference. Changes in muscular activity dependent on training can be expected. The performance patterns in a sensorimotor learning process is related, as an external criterion, to the synchronously deviated bipolar EMG of the muscular groups sharing in the motion are analyzed. The corre-

lation between performance efficiency in the external criterion and the degree of distinction of the parameters of muscular activity is statistically significant. The changes of muscular activity conditioned by training are independent of the rate of motion and of the passive external force motion has to overcome. The decrease in the level of myoelectric activity is explained by a reduction of synergistic activity. The possibility of developing a method of aptitude diagnostics from the EMG analysis is suggested. (Russian summary) & (40 ref.)—*Journal summary*.

8325. Nicoll, R. A. (St. Elizabeths Hosp., Washington, D.C.) **Recurrent excitation of secondary olfactory neurons. A possible mechanism for signal amplification.** *Science* 1971(Feb), Vol. 171(3973), 824-826.—Results of experiments with rabbits indicate that secondary neurons of the olfactory bulb can be excited milliseconds after activation of neighboring secondary neurons by antidromic and orthodromic volleys. Recurrent excitation of secondary neurons are proposed to synapse with other secondary neurons, thus forming a direct recurrent excitatory pathway. Such a positive feedback system could strengthen the original input signal. (18 ref.)—*Journal abstract*.

8326. Satoh, Fuyohiko. (Aichi-Gakuin U., Nagoya, Japan) **Facilitation of the direct cortical response of the visual cortex in association with rapid eye movement during paradoxical sleep in the cat.** *Brain Research* 1971, Vol. 26(2), 415-419.—Tested the hypothesis that there might be changes in the positive (P) and negative (N) deflections of the direct cortical response (DCR) in the visual cortex during bursts of REM in paradoxical sleep. DCRs were recorded throughout the sleep-wakefulness cycle from the posterior lateral and posterior sigmoid gyri of 11 cats with chronically implanted electrodes. Results show a greater facilitation of N waves than of P-waves in the posterior lateral gyrus suggesting that more apical dendrites were facilitated than were neurons of deeper layers. (21 ref.)—*P. Hertzberg*.

8327. Schapiro, Shawn & Salas, Manuel. **Effects of age, light and sympathetic innervation on electrical activity on the rat pineal gland.** *Brain Research*, 1971, Vol. 28(1), 47-55.—The pineal gland of the adult rat exhibits low amplitude, high frequency spontaneous activity at about 13-22 cps with periodic bursts of 1-3 sec duration at 6-12 cps. A following response is seen after photic stimulation with white light at 2.5, 5, or 10 flashes/sec. Yellow, blue, and green light elicited essentially the same responses as white light, but the response to red light was much smaller. Superior cervical ganglionectomy did not abolish the following response but eye enucleation did. Spontaneous activity of the pineal gland could be seen in 13-day-old rats but the following response was not present until about Day 18. (23 ref.)—*Journal summary*.

8328. Shahani, Bhagwan. (Churchill Hosp., Oxford, England) **Flexor reflex afferent nerve fibres in man.** *Journal of Neurology, Neurosurgery & Psychiatry* 1970(Dec), Vol. 33(6), 786-791.—Identified flexor reflex afferent nerve fibers in the mixed peripheral nerve and afferent nerve fibers in the mixed peripheral nerve and measured their conduction velocity. 5 female and 2 male 14-49 yr old normal Ss were used. It was demonstrated that the flexor reflex afferent fibers have a higher threshold of stimulation than the motor fibers supplying the foot muscles. The effect of conditioning volleys in the flexor reflex afferent fibers on the H reflex has been

determined and reciprocal inhibition of extensor motoneurons has been found to be related to the 2nd component of the flexor reflex. (23 ref.)—*Journal abstract.*

8329. Shimoji, K., Higashi, H., & Kano, T. (Kumamoto U., Medical School, Japan) **Epidural recording of spinal electrogram in man.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 236-239.—Describes a safe, simple method of recording human spinal electrogram. The method is based on established techniques for administering epidural anesthesia. Application of the technique to the diagnosis of human spinal diseases and to physiological and pharmacological studies of the human nervous system are discussed. (French summary)—*Journal summary.*

8330. Shlayfer, T. P. & Yakovleva, M. I. (USSR Academy of Medical Sciences, Inst. of Experimental Medicine, Leningrad) **Neironnaya aktivnost' somatosensornoi oblasti kory golovno mozga krysa, podvergnutykh vozdeistviyu staticheskikh elektricheskikh polei.** [Single unit activity in the somatosensory cortex of rats under influence of static electric fields.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1689-1693.—Exposed a control and an experimental group of albino rats to repeated action of static electric fields (5-6 hr. daily during 5-6 days, of the 400 V/cm). The background firing rate of the somatosensory neurons in the Ss (5 ± 0.09 cps as compared with 15 ± 2 cps initially) decreased. The neuron responses to sound and tactile stimuli decreased, however, the number of responding neurons increased. The afterdischarge frequency recovered more slowly.—*Journal summary.*

8331. Steriade, M., Apostol, V., & Oakson, G. (U. Laval, Medical School, Montreal, Quebec, Canada) **Clustered firing in the cerebello-thalamic pathway during synchronized sleep.** *Brain Research*, 1971, Vol. 26(2), 425-432. Reports a series of experiments "on changes in spontaneous and evoked unit activity in the thalamic motor relay (ventrolateral-VL-nucleus) at different levels of vigilance," using adult cats as Ss. To find out whether (a) "clustered firing may occur during sleep also in the cerebellar output, supplying the main group of afferences to the VL nucleus," and (b) "whether cerebellar spike bursting could be responsible for the VL clustered firing seen during synchronized sleep," single units in deep cerebellar nuclei were recorded to study their alterations during slow sleep and waking. The VL patterns of discharge following interruption of cerebello-thalamic projections were also recorded. "High-frequency spikes and superimposition of the burst on a depolarizing wave subsequent to slow positive shifts suggest that VL clusters follow long-lasting inhibitory periods." Conversely, "firing patterns of neurons in deep cerebellar nuclei do not seem to represent an effect of inhibitory cortico-nuclear projections." (18 ref.)—P. Herzberg.

8332. Stevens, S. S. (Harvard U.) **Neural events and the psychophysical law.** *Science*, 1970(Dec), Vol. 170(3962), 1043-1050. Reviews studies that examine factors that mediate sensory intensity. The question is examined as to the extent to which measured quantities of neural activity manifest an invariance similar to that in psychophysics, which states that equal stimulus ratios produce equal sensation ratios. Studies from vision, audition, cortical potentials, and the taste nerve are

reviewed. It is felt that power functions like those that govern subjective magnitude may show themselves in neuroelectric effects. It is concluded that neuroelectric power functions demonstrate a capability, i.e., that sensory systems are capable of power-function transformations, although the precise role of the transformations remains to be determined. (33 ref.)—P. McMillan.

8333. Thysell, Richard V. (U. Waterloo, Ontario, Canada) **Reply to Lieblisch's note.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 153-154.—R. V. Thysell (see PA, Vol. 44:3235) reported bimodal simple RT distributions of single motor units to light I. Lieblisch's (see PA, Vol. 46:Issue 5) suggestion that the lower mode of the distributions (at the interval 150-174 msec.) reflects the orienting response of the units was not supported by analysis. However, the hypothesis was not completely discredited, for the orienting response may occur as a function of the sequential relationships between ITIs.—*Journal abstract.*

8334. Walter, Donald O. (U. California, Brain Research Inst., Los Angeles) **Two approximations to the median evoked response.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 246-247.—Suggests and illustrates a method of approximating median evoked responses, which does not require large storage or computation facilities. (French summary)—*Journal summary.*

8335. Zenkin, G. M. & Pigarev, I. N. (USSR Academy of Sciences, Inst. of Information-Transmission Problems, Moscow) **Metodika issledovaniya ganglioznykh kletok setchatki i neironov mozga u ryb v usloviyakh svobodnogo plavaniya.** [A method for studying the retina ganglionar cells and the brain neurons in the fish during free swimming.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1859-1861. Employed a method which involved a manipulator device equipped with microelectrodes which were operationally introduced into the cranium of a pike kept in a fixed position. The microelectrodes were adjusted to a position of just touching the visual tract. Under conditions of free swimming it was possible to observe the reactions of elements being recorded to immovable stimuli put in their field of vision. The variables were (a) sizes of the receptive field, (b) preferential stimuli for any particular elements, and (c) type of response to various stimuli. Results reveal that the type of response for the state of immunity is the same as when the S is allowed free swimming.—I. Halev.

Electroencephalography & Evoked Potentials

8336. Airapet'yants, E. Sh. & Vasil'ev, A. G. (Leningrad U., Chair of Higher Nervous Activity, USSR) **Kharakteristika vyzvannykh potentsialov slukhovogo analizatora letuchikh myshel na stimuly s raznoi chastotoi zapoineniya.** [The characteristics of the evoked responses in the auditory system of bats to the evoked responses in the auditory system of bats to the ultrasonic stimuli of different fill frequency.] *Fiziologicheskii Zhurnal USSR*, 1970(Dec), Vol. 56(12), 1721-1730.—Investigated electrical activity and single unit activity of the cochlear nucleus, inferior colliculus, medial geniculate body, and auditory cortex. The maximum sensitivity to ultrasonic stimuli in *Myotis* *otis* (Vespertilionidae bat with frequency modulation-echolocation sounds) was discovered at frequencies which are contained in the echolocation cry. The

thresholds in *Rhinolophus ferrum equinum* (*Rhinolophidae* bats) in 80 kcps frequency band. Being the echolocation frequency—were 15–30 db more than those in adjacent frequencies. The response areas of single neurons in both species were similar to those observed in mammals at corresponding levels. However, results reveal some peculiarities in single unit activity in *Rhinolophidae* connected with the character of echolocation sounds. In particular, the most narrow response areas are discovered within 80–90 kcps frequency band and the number of these neurons increases up to the auditory cortex (18 ref.)—*Journal summary*.

8337 Andreeva, V. N., Baltay, A., & Kratin, Yu. G. (Pavlov Inst. of Physiology, Leningrad, USSR). *Osobennosti elektricheskikh reaktsii mozga i povedeniya koshki pri posledovatel'nom tormozhenii posle tonkikh differentsirovok*. [Features of the cerebral electrical reactions and cat behavior resulting from successive inhibition after fine differentiations.] *Zhurnal Vysshego Nervnogo Deystviya* 1970(Sep) Vol. 20(1), 1079-1082.—4 cats with chronically implanted electrodes were used to study (a) the characteristics of the EEG for successive inhibition resulting from fine differentiation, and (b) the mechanism for the emergence of this form of inhibition. Positive and inhibitory motor-alimentary CRs were elaborated to tones of various frequencies. The afteraction following upon the processes of fine differentiation, was shown to be very dynamic, with the relationship between the excitatory and inhibitory processes constantly developing and continuously changing as differentiations stabilized. The data demonstrated the coexistence in the same reflex arc of the excitatory and inhibitory processes, operative in various parts thereof. The observed development of deeper successive inhibition is held to be probably due not only to the inertness of the inhibitory process, but also to the mechanism of negative generalization. 1 D. London.

8338 Barnett, T. P., et al. (Westinghouse Electric Corp., Annapolis, Md.) *Bispectrum analysis of electroencephalogram signals during waking and sleeping*. *Science*, 1971(Apr), Vol. 172(3981), 401-402.—In an experiment with 8 male 17–20 yr old Ss the degree of interaction of component waves making up a single EEG trace was strongly correlated with alpha activity, lead placement, and state of consciousness. Significant quadratic coupling of the waves was found only for awake Ss with high alpha activity. For these Ss about 50% of beta activity can be attributed to harmonic coupling with the alpha peak. During sleep, the degree of interaction was of borderline significance and did not follow a consistent pattern with respect to S, frequency, state, or lead.—*Journal abstract*.

8339 Boddy, John. (U. Manchester, England) *The relationship of reaction time to brain wave period: A re-evaluation*. *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 229-235.—Attempted to reproduce the correlations found by W. Surwillo (see PA, Vol. 37-7664) between RT and EEG wave modalities, and period analysis paradigms. In Exp. 1, a representative mean alpha period (from temporal and occipital derivations) was obtained for each of 12 female Ss. Interindividual correlations between each of 12 female period and visual RT were not significant when recorded under conditions of high incentive. Even lower correlations were obtained in another group of 15 male and 5

female Ss. In Exp. II, mean values of the EEG period were determined for 15 male and 5 female Ss immediately preceding each RT stimulus. The inter- and intraindividual correlations between EEG period and RT were not significant for auditory and visual RTs in both experiments. Surwillo's findings were not reproduced. Possibly sources for the discrepancies are discussed. (1 summary) (27 ref.)—*Journal summary*.

8340 Bourne, J. R., Childers, D. G., & Perry, N. J. (Vanderbilt U.) *Topological characteristics of the visual evoked response in man*. *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(4), 423-436.—Studied the characteristics of the visually evoked responses (VERs) recorded from multiple electrode arrays at the occipital scalp of 5 normal Ss by means of a spatial-temporal mapping technique. Waveforms obtained from different spatial recording locations displayed different characteristics. These characteristics were analyzed simultaneously by construction of a spatiotemporal map which allowed simplified temporal observation of the evoked set of wave forms. The temporal variation of the spatial potential gradient defined by the summated VER appeared to have a rotational tendency. Groups of potentials appeared over large areas of the occipital scalp and rotated after presentation of a light stimulus, suggesting that underlying neuronal populations may have been firing asynchronously. 2 major sources are postulated that account for the prominent features of the spatially recorded VER. (French summary) (46 ref.)—*Journal summary*.

8341 Campeau, E., et al. (U. California Brain Research Inst., Los Angeles) *EEG discriminators of delayed matching to sample performance in Macaca nemestrina*. *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 413-418.—Tested 8 Macaca nemestrina monkeys chronically implanted with cortical limbic, and diencephalic EEG electrodes on a delayed matching-to-sample task. EEGs recorded during task periods were analyzed for coherence values as consistent concomitants of performance. The coherence values associated with correct responses were generally higher than those for incorrect responses in the frequency bands 1–3, 3–4, 5–7 and 8–13 Hz. It is suggested that higher coherences occur throughout critical trial epochs associated with successful or rewarded behavioral responding and that the occurrence of these elevated coherences may be necessary for optimal or rewarded performance. (25 ref.)—*Journal abstract*.

8342 Cohn, Robert. (5530 Wisconsin Ave., Chevy Chase, Md.) *Differential cerebral processing of noise and verbal stimuli*. *Science*, 1971(May), Vol. 172(3938), 599-601.—Psychophysiological measurements have indicated that the right cerebral hemisphere processes noises and other nonverbal data and that the left processes verbal material. Results of a study with 37 Ss with clinically normal auditory acuity, indicate that direct physiological measurements, as expressed in summated auditory evoked cortical responses, demonstrate that click noises show a greater amplitude of initial output over the right brain, and that verbal stimuli produce either equal or higher amplitudes of output over the left cerebral hemisphere.—*Journal abstract*.

a technical discussion of the advantages of using the analogue computer in the analytic treatment of the EEG.—I. D. London.

8344. **Dumenko, V. N.** (Bogomolets Inst. of Physiology, Kiev, USSR) **Otrazhenie v EEG sobak razlichnogo funktsional'nogo sostoyaniya kory golovnogo mozga.** [Reflection of different functional states of the cerebral cortex in the EEG of dogs.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 992-999.—3 Ss were used to study EEG changes with different functional states of the cerebral cortex: the arousal reaction and the orienting reaction during the elaboration of CRs (1 S, motor-defensive CR; 2 Ss, food-procuring CR). Different degrees of activation characterized the electrographic features of the arousal and orienting reactions, emphasizing the dissimilarity of the functional states of the cerebral cortex. The generalized character of activation during the 2 reactions embraced synchronization of potential oscillations covering all parts of the cortex. Therefore, in any electrographic evaluation of different functional states of the cortex, it is held necessary to consider not only changes in amplitude and frequency of electrical activity, but also the character of the interrelationships between the different cortical regions. It is necessary to distinguish this generalized short-term synchronization from the long-sustained selective synchronization observed in the formation of a dynamic stereotype. (English summary) (25 ref.)—I. D. London.

8345. **Fanardzhyan, V. V. & Kazaryan, L. L.** (Orbeli Inst. of Physiology, Erevan, USSR) **Vyzvannye potentsialy kory mozzhechka koshki v khronicheskom éksperimente.** [Evoked potentials in the cat cerebellar cortex in chronic experiment.] *Fiziologicheskii Zhurnal SSSR*, 1970(Oct), Vol. 56(10), 1360-1368.—18 unrestrained cats, each with 14 epidurally implanted electrodes in the cerebellar cortex, were used to study cerebellar cortex evoked potentials in response to light flashes, clicks, and electrodermal stimulation of the limbs under the conditions of chronic experiment. It was shown that cerebellar cortex evoked potentials in response to peripheral stimulation were basically different in form and topography of distribution from those recorded in the acute experiment. They consisted of a wave, whose main part was formed by an initial large negative wave, a subsequent positive one of lesser amplitude and longer duration, and a weakly expressed 2nd negative deviation. Analysis of the component-composition of the evoked potentials showed that the initial negative wave was due to cerebellar cortex neuronal activation by the mossy fibers, while the positive wave with the succeeding negative deviation resulted from the influence of impulsion from the climbing fibers on the cerebellar cortex neuronal elements. In normal Ss the afferent systems enjoy wide representation, embracing all the cerebellar cortex areas without limitation in zones determined under the conditions of acute experiment. (English summary) (30 ref.)—I. D. London.

8346. **Frid, G. M.** (Inst. of Child & Adolescent Physiology, Moscow, USSR) **Vliyaniye orientirovochnoi reaktsii na zritel'nye vyzvannye potentsialy v EEG detei shkol'nogo vozrasta.** [Influence of the orienting reaction on visual evoked potentials in the EEG of schoolchildren.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1016-1021.—70 7-15 yr. old Ss participated in a study of the role of the orienting

reaction to sound in the perception of sensory information, utilizing evoked potentials to a light flash in the occipital, parietal, central, and frontal areas of the cerebral cortex. Recordings were made of the EEG and autonomic components of the orienting reaction. Against a background of quiet wakefulness the effect of the reaction was shown to consist in facilitating evoked potentials by increasing the amplitude and shortening the peak latency of their initial components. Stable responses with short latency appeared beyond the borders of the projection zone along with intensification of secondary oscillations, expressed with especial distinctness in the frontal area. Superimposing a "foreign stimulus" on the working state of the higher nervous centers produced a generalized suppression of evoked potentials in all recordings along with the retention of early components in the visual area. It is concluded that the influence of the orienting reaction on visual evoked potentials is not uniform and is determined to a considerable extent by the initial functional state of the cortical apparatus. (English summary) (16 ref.) I. D. London.

8347. **Fruhstorfer, H.** (U. Marburg, Inst. of Physiology, W. Germany) **Habituation and dishabituation of the human vertex response.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 306-312.—Studied habituation and dishabituation of the vertex response in 5 human Ss who received short trains of auditory (C) or somatosensory (S) stimuli. Both C and S stimulation resulted in rapid habituation of the vertex response. Simultaneously, stimulus generalization developed across these 2 modalities as the heteromodal stimulus in a train evoked a response whose latencies and amplitudes had values lying between those observed in the habituated and the nonhabituated responses to the same stimulus. From neither modality could dishabituation be elicited in the other. Findings are explained by the assumption that auditory and somatosensory information converge in a subcortical center and ascend in a common corticopetal pathway. Results support the hypothesis that the vertex response is mediated by an extralemniscal system. (German summary) (22 ref.)—Journal summary.

8348. **Funakoshi, M. & Kawamura, Y.** (Osaka U., Dental School, Japan) **Summated cerebral evoked responses to taste stimuli in man.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 205-209.—Recorded the evoked cortical responses to taste solutions applied to the tongue surface of 5 waking adults. Responses were characterized by 2 positive waves with onset latencies of approximately 150 msec. and 500-1500 msec. The early wave was due to mechanical stimulation resulting from pouring the solution on the tongue surface, while the late wave was the gustatory response. Significant gustatory responses were found for acid and salt solutions, but not for sucrose or quinine hydrochloride. Results are discussed in terms of localized taste receptors. (French summary)—Journal summary.

8349. **Fuster, Joaquin M. & Uyeda, Arthur A.** (U. California, Brain Research Inst., Los Angeles) **Reactivity of limbic neurons of the monkey to appetitive and aversive signals.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 281-293.—Trained 6 male monkeys to press separate levers in response to visual stimuli for food or shock. 1 other S was untrained, and 1 trained S was subjected to extinction after a

number of recordings. After training limbic unit discharge and EEGs from limbic structures were recorded during performance. It was found that (a) spontaneous activity of limbic units was higher in the trained Ss, (b) over all units sampled from the amygdala, hippocampus, and parafornix cortex of trained Ss responded with changes of firing frequency to stimulus presentation with excitatory responses being more common than inhibitory responses, (c) reactivity of limbic units in magnitude and number of responses was higher in performing Ss, (d) more units responding differentially to the stimuli were found in the amygdala, and (e) limbic structure EEGs showed nonspecific reactions to the stimuli characterized by transition to frequencies higher than those in resting EEGs. Results suggest that integrative processing of significant sensory information takes place in successive stages proceeding from sensory systems through the inferior and mesial temporal cortex toward the hippocampus and the amygdala. (French summary) (35 ref.)—*Journal summary*

8350. Gale, Anthony; Coley, Michael, & Boyd, Elizabeth. (U. Exeter, England) Variation in visual input and the occipital EEG: II. *Psychonomic Science* 1971(Apr), Vol. 23(1B), 99-100. Replicated and extended the number of viewing conditions of a previous study by A. Gale & N. Dunkin and M. Coley (see PA Vol. 43 [10891]) which found that resting EEG varied with eyes closed, eyes open with matt black display, and patterned stimulation. The resting EEGs of 29 undergraduates were examined during exposure to 5 different conditions of visual stimulation: (a) eyes shut, (b) eyes open in the dark, (c) viewing a blank screen, (d) viewing a simple pattern, and (e) viewing a more complex pattern. Each condition was presented twice according to a random schedule (2 min trial). For alpha and beta frequencies, EEG amplitude varied inversely with ascending visual complexity. For theta frequencies, this relation held except for a reversal for Conditions d and e.—*Journal abstract*

8351. Genkin, A. A., Mordukhovich, E. F., & Bodrov, V. A. Srednii period spontannoi EEG kak kharakteristika nekotorykh svoistv vysshei nervnoi deyatel'nosti cheloveka. [Average period of spontaneous EEG as a characteristic of some properties of human higher nervous activity.] *Zhurnal Psich. i Nervn. Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1089-1092.—18-21 yr. old males were used to study the connection between (a) average period and average level of asymmetry of phase durations of spontaneous EEG oscillations, and (b) several psychophysiological characteristics (evaluated 6 mo prior to recording of the EEG). A correlational matrix was computed for 27 psychophysiological and 2 EEG indices. Various indices of human efficiency were affected differently by noise. Speed of informational analysis against a background of auditory noise was enhanced for most of the Ss, but in 2 it was diminished. The average period of spontaneous EEG was shown to be (a) an indicator of relatively stable properties of higher nervous activity, and (b) an important differential index of individual differences. Other findings are presented.—I. D. London.

8352. Golovchinskii, V. B., & Toman, P. S. Dinamika vyzvannykh potentsialov v somatosenzornoi sisteme. [On the dynamics of evoked potentials in the somatosensory system.] *Fiziologicheskii Zhurnal SSSR*, 1970(Oct), Vol. 56(10), 1337-1343.—Awake adult

cats in chronic and acute experiments (spontaneous and evoked potentials, respectively) were used to study the influence of (a) ether inhalation on (a) the threshold for the emergence of evoked potential, and (b) the restoration of evoked potential in the somatosensory cortex after deafferentation of the lateral nucleus of the thalamus when the paw was cut and electrically stimulated. It was discussed that the threshold for the emergence of evoked potential in the somatosensory cortical zone increased sharply from the very beginning of ether inhalation. In Stage I of general anesthesia the evoked potential was blocked completely. The curve of the restoratory cycle moved sharply downward and to the right; in Stage III a period of facilitation disappeared with a 100-msec interval. The threshold for the emergence of evoked potential in the thalamic relay nucleus changed comparatively little and the curve of the restoratory cycle moved somewhat downward. It is suggested that electroanesthetic effects from the inhibition of higher cortical functions connected with the analysis of sensory information. (English summary) (32 ref.)—*I. D. London*

8353. Hermann, Howard T. (Harvard Medical School, Boston, Mass.) Saccade correlated potentials in optic tectum and cerebellum of *Carassius auratus*. *Brain Research*, 1971, Vol. 26(2), 293-304.—In the encephalic zone goldfish (*Carassius auratus*), when recording in the dark-adapted state 50-200 msec. after the onset of a conjugate eye saccade, a predominately negative potential 150-200 msec. in duration, with peak amplitude ranging from 200-500 μ V, appears over the lateral surface of the optic tectum. Recording at successive depths, the negative wave decreases in amplitude, disappearing at a depth of \sim 500-750 μ m. A positive going potential emerges at depths of 1000-1250 μ m., whose peak corresponds in time to the superficial negative wave. The negative wave in the valvula. Potentials in the optic tectum evoked by saccadic eye movement in the light show shorter latency, more uniform, multiphasic waveform, and absence of detectable potentials in the surface to \sim 300 μ m. levels of the tectal layers. Stretch of the abducens eye muscle can produce a 5-10 msec. latency negative going wave in the contralateral tectum. Transection of all eye muscles of the globe reduces the amplitude of tectal saccadic evoked potential largely in the ipsilateral tectum, without change in waveform or timing. Also, saccadic movements of the opposite eye increase in amplitude. The midline valvula of the cerebellum exhibits a presaccadic, positive going 200-600 μ V slow wave. High amplitude slow potentials, starting before the saccade, occur 1200 μ m. beneath the valvula surface. Mechanical distortion of the globe failed to produce any of these phenomena. G. I., & El'kina, G. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Izmeneniya impul'snykh reaktsii neuronov i vyzvannykh otvetov zritel'noi kory krolika pri vyrobke uslovnogo refleksa.** [Changes in impulse reactions of neurons and evoked responses in the visual cortex of the rabbit in elaboration of a conditioned reflex.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1000-1009.—Defensive CRs were elaborated in 10 Ss (CS was 6 flashes of light at the rate of 1/sec; UCS was 4 electroshocks to the paw). During the 1st combinations of the CS (5th and 6th flashes) with electroshock, a decrease occurred in the slow negative wave and subsequent components of the secondary response. After a number of combinations, the same weakening of the slow negative wave was observed at the 1st and 4th flashes of the CS (the last before reinforcement). After 50-90 combinations the impulse reactions of neurons were investigated. In $\frac{1}{2}$ the recorded cells different impulse reactions to the single flashes of the series were detected. Impulse reactions to the 1st and 4th flashes were similar to those observed in response to flashes applied simultaneously with electroshock—a sharp shortening of the inhibitory pause, often accompanied by a new burst of activity; for the 2nd and 3rd flashes the inhibitory pause was longer. In the remaining neurons electroshock did not change the response to the light flash, and the impulse reactions to all 6 flashes of the series were the same. Upon removal of reinforcement for the 1st, 4th, and the 2 last flashes, the inhibitory pause and the new burst of activity were retained over the next 5-10 applications of stimuli. Then gradual restoration of the inhibitory pause and the slow negative wave occurred together with the disappearance of the new burst of activity. The role of the midbrain reticular formation in the weakening of cortical inhibition and CR closure is discussed. (English summary) (17 ref.)—*I. D. London*.

8356. Maeda, M., Shimazu, H., & Shinoda, Y. (U. Tokyo, Medical School, Japan) **Inhibitory postsynaptic potentials in the abducens motoneurons associated with the quick relaxation phase of vestibular nystagmus.** *Brain Research*, 1971, Vol. 26(2), 420-424.—Reports a study with 38 cats in which intracellular recording was performed from abducens motoneurons during the generation of vestibular nystagmus. It is concluded that "the quick cessation of motor nerve discharges is attributable, not only to a reduction of the excitatory postsynaptic potential... but also to the production of the inhibitory postsynaptic potential... in the motoneuron." (17 ref.)—*P. Hertzberg*.

8357. Marczyński, T. J., et al. (U. Illinois, Medical Center, Chicago) **Steady potential correlates of positive reinforcement and sleep onset in the cat: "Reward contingent positive variation" (RCPV).** *Brain Research*, 1971, Vol. 26(2), 305-332.—Studied steady potential (SP) to elucidate electrocorticogram (ECOG) phenomena associated with positive reinforcement by investigating the time course and possible relationship between postreinforcement synchronization (PRS) phenomena and SP shifts. Using 9 adult cats with chronically implanted electrodes, kept on a 23-hr food and water deprivation schedule, the SP correlates of PRS were compared to those occurring during (a) non-rewarded lever press performance, and (b) sleep onset in rewarded lever press performance. The effects of changes in intensity of ambient light and in quality of food reward were also tested. PRS, as well as reward contingent positive variation and sleep onset positive variation phenomena were observed and

interpreted as processes subserving internal inhibition. (70 ref.)—*P. Hertzberg*.

8358. May, James G., Forbes, William B., & Piantanida, Thomas P. (Louisiana State U., New Orleans) **The visual evoked response obtained with an alternating barred pattern: Rate, spatial frequency and wave length.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 222-228.—Studied the averaged visual evoked responses (VERs) recorded from the occiput in 4 adult male experienced Ss. It was found that the amplitude and latency of the averaged VER was related to the rate of alternation and the spatial frequency of the alternating barred pattern used to elicit the responses. Amplitude was determined largely by the background illumination, while latency was unaffected. Changes in the area of the pattern resulted in amplitude decrements and latency increments, especially between 5 and 2° of visual angle subtended. Differences in the wave length of patterns photometrically equated for brightness did not result in significant differences in amplitude and latency. Results are related to the findings of previous studies using patterned stimulation. (French summary)—*Journal summary*.

8359. Mnukhina, R. S. & Polyakova, T. V. (Leningrad State U., USSR) **K voprosu o korrelyatsii mezhdu EEG i impul'snoi aktivnost'yu odinonnykh neuronov kory pri vyrobke uslovnnykh refleksov.** [On the correlation between the EEG and the impulse activity of single cortical neurons in the elaboration of conditioned reflexes.] *Nervnaya Sistema*, 1969(Dec), No. 10, 29-36.—Presents some results of research on the closure of conditioned connections at the neuronal level in chronic experiments with unanesthetized and nonimmobilized rabbits in order to gain further information as to whether a correlation exists between the EEG and the impulse activity of single neurons. A cardiac CR to 500- and 1000-cps tones was formed with inhalation of ammonia vapor as UCS. The impulse activity of single neurons in the auditory cortex at a depth of 900-1800 μ was recorded extracellularly. Stable spontaneous impulse activity was expressed in the form of monophasic negative or biphasic positive-negative potentials and reacted to an indifferent acoustic stimulus with either a quickening or slowing of impulsion. The data indicated that the lack of correlation, noted by so many researchers, between the summated EEG and the impulse discharges of neurons is only apparent, since it is difficult to record the potentials of just that neuron corresponding exactly to the part of the cortex from which the summated EEG is recorded. As a result of investigating both summated and single cellular activity of the cortex in the process of elaborating CRs, it is concluded that their characteristics coincide "a correlation not in a literal sense, but a correlation in essence in the broad sense of this word."—*I. D. London*.

8360. Nebylitsyn, V. D. & Bazylevich, T. F. (USSR Academy of Pedagogical Sciences, Inst. of General & Pedagogical Psychology, Moscow) **Vyzvannyye potentsial dvigatel'noi zony kory u cheloveka.** [Motivated potential in man.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1682-1688.—Electronic computer averaging technique made possible the extraction of motor evoked potential (MEP) of 12 adult males from their EEGs which is a characteristic sequence of negative and positive bioelectrical oscillations accompanying passive movements of muscular groups. Results reveal the main MEP negative component is

formed by the interaction of specific (proprioceptive) and unspecific (reticular) impulsations. The latter arrives to the cortex with some individually varying delay which underlies the "doubling" phenomenon of the main MEP negative component. Individual differences are also evident in the dynamics of the MEP components when the amplitude of muscular contraction increases.—*Journal summary.*

8361. Picton, T. W., Goodman, W. S., & Bryce, D. P. (U. Toronto, Ontario, Canada) **Amplitude of evoked responses to tones of high intensity.** *Acta Otolaryngologica*, 1970(Aug), Vol. 70(2), 77-82.—The amplitude of the human cortical evoked response increases in amplitude with increasing intensity of auditory stimulation. At intensities above 70 db. ISO, however, there is a decline in this relationship. This effect was examined in conjunction with stapedius reflexes and other factors in an attempt to determine its cause. The most probable explanation seems to involve the central descending auditory system. (German summary) (32 ref.)—*Journal abstract.*

8362. Saunders, James C. (Monash U., Clayton, Victoria, Australia) **Selective facilitation and inhibition of auditory and visual evoked responses during avoidance conditioning in cats.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 15-25.—Used escape procedures to shape a tilt-cage response that minimized motor activity in cats. Avoidance of shock was subsequently made contingent on a tilt response made in the presence of a visual or acoustic CS. The amplitude of sensory evoked responses was measured in 7 adult cats during acquisition of the avoidance behavior at peripheral (cochlear nucleus and optic chiasma) and central (auditory and visual cortex) regions of the primary auditory and visual pathway. Results indicate systematic changes in cortical evoked activity that were related to both the rate of avoidance acquisition and the behavioral significance of the stimulus. Similar changes were not observed at the peripheral sites. (23 ref.)—*Journal abstract.*

8363. Simernitskaya, E. G. **Izuchenie regulyatsii aktivnosti metodom vyzvannykh potentsialov.** [Study of the regulation of activity by the method of evoked potentials.] Moscow, USSR: Moscow U., 1970. 72 p.—Presents the results of research on activation, utilizing evoked potentials. It was established that states of activation are accompanied by an increase in the working level of the cerebral cortex, 1 of whose manifestations is desynchronization of cortical rhythm. It was shown that different forms of activity affect differently the character of cortical bioelectrical activity, so that the character of the spatial distribution of evoked-potential changes in the performance of different forms of activity is different. Data were procured on the prior recruitment of the occipito-parietal regions of the right hemisphere into the process of visual analysis. In the simplest forms of activity, involving the visual analyzer but not associated with any complex treatment of information, evoked-potential changes, coinciding in time with the perception of photic stimuli, were disclosed only in the right visual cortex. However, when appropriate verbal instructions were first given, evoked-potential changes were recorded also in the left cortex. A decrease was also noted in the latent periods of the secondary evoked-potential components in the right cortex (occipito-parietal and centro-frontal areas). Data

were also procured on the role of the frontal lobes in regulating the processes of activation and in supporting the selectivity of intended behavior. The relationships between evoked-potential parameters and pathological states in the cerebral tissues were explored and much of interest determined. (5 p. ref.)—*J. D. London.*

8364. Smith, D. B., Allison, T., Goff, W. R., & Principato, J. J. (U. Vermont, Medical School) **Human odorant evoked responses: Effects of trigeminal or olfactory deficit.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 313-317.—Investigated whether the odorant evoked response (OER) is due to stimulation of olfactory receptors, or of nasal trigeminal afferents in the nose. OER recording was carried out in 2 Ss with total facial hemianesthesia, in 1 S with unilateral loss of olfaction, and in 3 normal Ss following cocaine block of the olfactory area or block of all nasal mucosa excluding the olfactory area. Stimulation was unilateral. In all Ss normal OERs were recorded to stimulation of the normal nostril. Lack of trigeminal innervation resulted in abolition of the OER, whereas loss of olfactory function usually produced no OER change. The OER as recorded under these experimental conditions appeared to be evoked solely by stimulation of nasal trigeminal afferents. The problems involved in recording a human OER are discussed. (French summary)—*Journal summary.*

8365. Sudakow, Konstantin; MacLean, Paul D., Reeves, Alexander, & Marino, Raul. (National Inst. of Mental Health, Bethesda, Md.) **Unit study of exteroceptive inputs to claustrorortex in awake, sitting, squirrel monkey.** *Brain Research*, 1971, Vol. 28(1), 19-34. Responses to gustatory, somatic, auditory, and photic stimulation of more than 1,800 units located in the claustrorortex, the frontal and temporal opercula, the claustrum and elsewhere were observed. In the claustrorortex approximately 1/4 of 500 units responded to some form of sensory stimulation. Differences in the location of units responding, respectively, to somatic, auditory, and gustatory stimulation were statistically significant. Only 2 units of the claustrorortex responded to photic stimulation. A new type of unit was encountered in the claustrorortex and frontal operculum which was activated by approaching objects. Results are discussed in the light of existing knowledge about the insula. (39 ref.)—*Journal summary.*

8367. Vasil'ev, A. G. (Leningrad State U., USSR) **Kharakteristika vyzvannykh potentsialov i reaktsii otel'nykh neuronov zadnego dvukholmiya letuchikh myshei pri razdrazhenii parnyimi ul'trazvukovymi stimulami.** [Characteristics of the evoked potentials and reactions of single neurons of the posterior colliculi in bats on stimulation with paired ultrasonic stimuli.] *Nervnaya Sistema*, 1969(Dec), No. 10, 124-132.—Ss were narcotized bats from 2 families—Vespertilionidae and Rhinolophidae. The amplitude of posterior collicular evoked potentials to the 2nd stimulus of a presented pair equaled the response to the 1st stimulus in 3-20 msec. sometimes exceeding it. The number of spikes in the response of single neurons was equal for each of the pairs of stimuli, given a 10-20 msec. interval between them.

The amplitude of evoked potential and the number of spikes of single neurons in response to the 2nd stimulus decreased with decrease in the rest period between stimuli. Restoration of the amplitude of response to the 2nd stimulus was optimal with stimuli of low and moderate strength, securing 2 types of reactions for single neurons: (a) optimal reaction to the 2nd stimulus when its strength was low, and (b) optimal when high. California, Medical Center, San Francisco) **A compact six-channel integrated circuit EEG telemeter.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 240-245.—Describes a lightweight head-mounted telemeter which permits artifact-free EEG recording during laughter. Integrated circuits without excessive battery drain were produced by using pulse position modulation and reduced battery voltages. Some advantageous features of the device are outlined: (a) clip-on rechargeable battery packs facilitate recording for fairly long periods, (b) the use of low noise preamplifiers with micropak transistors makes it practical to telemeter small amplitude EEGs from normal Ss, (c) needle or disc electrodes may be used, (d) depth electrodes can be used with external attenuators, and (e) the crystal controlled transmitter produces virtually no frequency drift. It is concluded that with the addition of external networks, the telemeter can be used for respiration, EKG, and GSR response recording. (French summary)—*Journal summary.*

8369. Webb, W. B. & Friedmann, J. K. (U. Florida, Coll. of Arts & Sciences) **Some temporal characteristics of paradoxical (LVF) sleep occurrence in the rat.** *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 453-456.—Studied the 24-hr EEG recordings of 2 groups of 4 male Long-Evans rats. It was found that (a) paradoxical sleep, low voltage fast EEG waves (LVF), increased in probability of initial occurrence with increased length of slow wave sleep; (b) the mean length of time of and between successive LVF episodes did not differ; and (c) there was a higher proportion of LVF sleep during the dark period of the circadian cycle even when length of sleep was held constant. (French summary)—*Journal summary.*

8370. Webster, W. R. (Monash U., Neuropsychology Lab., Clayton, Victoria, Australia) **The effects of repetitive stimulation on auditory evoked potentials.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 318-330. Recorded evoked potentials in the cochlear nucleus, inferior colliculus, and medial geniculate body of 17 unanesthetized cats in response to repetitive auditory stimuli. The effects of stimulus intensity and rate of stimulation were studied. Changes typical of a habituation process did not occur. (a) weaker stimuli did not produce larger evoked potential decrements than stronger stimuli, (b) dishabituation did not occur with changes in rate of stimulation or pairing of auditory stimuli with electric shocks, and (c) no decrements were observed at stimulus rates of $\frac{1}{20}$ sec. Although amplitude decrements occurred in which the magnitude of the decrement was a function of the rate of stimulation, these decrements were considered simple rate effects. In the inferior colliculus, the effects of rate of stimulation depended on the area of the nucleus from which recordings were taken. (French summary) (22 ref.)—*Journal summary.*

8371. Webster, W. R. & Bock, G. R. (Monash U., Neuropsychology Lab., Clayton, Victoria, Australia) **The effects of repetitive stimulation on the rat inferior colliculus.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 331-336. Studied amplitude decrements of click-evoked potentials in the inferior colliculi of 5 restrained hooded rats. Repetitive stimulation was administered to each S at 100 and 70 db. peak equivalent SPL, with control stimuli being given before and after the repetitive stimulation. Significant decrements were observed in both the early and late components of the evoked potential. Both components recovered rapidly after cessation of repetitive stimulation, and the pattern of decrements did not differ over the 2 intensities. It is concluded that the decrements were not true habituation decrements. It is suggested that the mechanism responsible for the decrements might be recurrent postsynaptic inhibition. (French summary) (16 ref.)—*Journal abstract.*

8372. Whishaw, I. Q. & Vanderwolf, C. H. (U. Lethbridge, Alberta, Canada) **Hippocampal EEG and behavior: Effects of variation in body temperature and relation of EEG to vibrissae movement, swimming and shivering.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 391-397. Examined hippocampal and neocortical EEG activity in 28 freely moving male hooded rats at normal rectal temperature and during artificial hypo- and hyperthermia. Hippocampal rhythmic slow activity (RSA) and neocortical low voltage fast activity occurred during walking, jumping, and swimming, but irregular hippocampal activity and cortical spindling occurred during immobility and shivering (when it occurred in the absence of other movement). Movements of the vibrissae were not directly correlated with RSA. During voluntary movement, RSA frequency varied from 2-12 Hz. over a temperature range of 23-42°C. RSA fell in amplitude only below about 26°C and disappeared entirely below 23°C. Simultaneously, voluntary movements also disappeared but shivering persisted below 20°C. Neocortical spindle activity was not observed below about 30°C. (23 ref.)—*Journal abstract.*

8373. Yanvarova, I. N., Kuz'mina, T. R., & Tuan, Yen. (Leningrad State U., USSR) **Elektricheskiye aktivnost' otdel'nykh sloev kory bol'shikh polusharij pri umiranii i reanimatsii zhivotnogo.** [Electrical activity of different layers of the cerebral cortex in the process of the animal's dying and revival.] *Neirofiziologiya*, 1969(Dec), No. 10, 20-28. Nembutalized cats were used to study the developing changes in evoked potentials at various cortical levels accompanying the evolution of grave hypoxia as a consequence of acute loss of blood (resulting clinical death defined as covering loss of blood (resulting clinical death defined as covering 5 min) and after the restoration of circulation and breathing. Evoked potentials were also recorded from the lateral geniculate body. Spontaneous electrical activity disappeared before the evoked potentials in the different cortical layers. Extinction and restoration of the cortical evoked potentials took place simultaneously at all levels of the cortex. Following clinical death and slow restoration of functions, positive evoked potentials with a short latent period appeared in the visual cortical layers. The data showed that the resistance of synaptic endings to hypoxia was not of 1 kind. (39 ref.)—*J. D. London.*

8374. Yoshie, N. & Okudaira, T. (Shinshu U., Faculty

of Medicine, Matsumoto, Japan) **Myogenic evoked potential responses to clicks in man.** *Acta Otolaryngologica*, 1969, Suppl. 252, 89-103. Recorded human myogenic potentials evoked by clicks from the external acoustic meatus and the postauricular region, by means of an average response computer. The configuration of the response was triphasic: a negative-positive-negative wave with extremely short latency of the peaks (about 10-25 msec). The focus of the response seemed to be localized in a restricted area of the postauricular region. It was a relatively consistent and low-threshold response. The magnitude of the response was amplified to a great extent by the forward flexion of the neck. The postauricular response was interpreted to be cochleo-myogenic in origin. It is concluded that the postauricular response can be used as an indicator of objective audiometry. There is a possibility that the response could be applied in an electrophysiological method of differentiating various otoneurogenic disorders associated with lesions in the brainstem. (German summary) (21 ref.) *Journal abstract*

8375 Zhirmunskaya, E. A. & Makarova, G. V. (Inst of Neurology, Moscow, USSR) **Raspreделение srednego urovnya asimmetrii dilitel'nostei faz voln EEG po poverkhnosti mozga cheloveka.** [Distribution of average level of asymmetry of EEG-wave phase durations over the surface of the human brain.] *Fiziologicheskii Zhurnal SSSR*, 1970(Oct), Vol. 56(10), 1321-1328. 22 healthy Ss participated in a study of the distribution of the average level of asymmetry of the durations of EEG-wave fronts (ascending and descending) for the main areas of the convex cortex of the hemispheres when the Ss were in a state of physiological quiet (while awake) and under the influence of rhythmic photic stimulation or when exposed to several other functional tests. The average level of asymmetry was found to be distributed along the cortical surface with longitudinal and latitudinal gradients. In the state of physiological quiet a decrease in the absolute magnitudes of this parameter occurred from occiput to forehead and from left temple to right. Simultaneously a shift in sign of asymmetry from negative to positive also took place. The average level of asymmetry increased in the presence of reactive changes in EEG structure. At the same time desynchronization of EEG rhythms was connected with a predominance of positive signs of asymmetric level, while hypersynchronization of biopotential waves was connected with a predominance of negative signs thereof. (English summary) (25 ref.)—*J. D. London*.

(Florida State U.) **Sensory transduction: A report based on a NRP work session.** *Neurosciences Research Program Bulletin*, 1970(Dec), Vol. 8(5), 459-560. Attempted "to integrate the contributions and interactions of the participants in discussing the central concepts and data on sensory transduction." The following aspects of sensory modalities are included: "(a) the ultrastructural features and chemical and electrophysiological properties of visual receptors and transduction, (b) the site of transduction in mechanoreceptors, (c) the mechanosensitivity of motile cilia, (d) the complexities of the electrical receptor mechanisms, [and] (e) chemoreceptors, both gustatory and olfactory, of insects and animals."—*B. Preilowski*.

8377 Bito, Laszlo Z., Dawson, M. Joan, & Petrinovic, Ijerka. (Cornell U., Medical School) **Cholinergic sensitivity: Normal variability as a function of stimulus background.** *Science*, 1971(May), Vol. 172(3983), 583-585. Findings from an experiment with 4 cats indicate that the sensitivity of the normally innervated iris sphincter to its neurotransmitter, acetylcholine, and to related agents varies inversely with the preexisting physiological stimulus background, i.e., the environmental light intensity. This normal variability suggests the existence of a negative feedback mechanism whereby sensitivity of the effector cell is modulated by a product of neuronal activity. *Journal abstract*.

8378 De Valois, Russell L. & Pease, Paul L. (California Primate Vision Lab., Berkeley) **Contours and contrast: Responses of monkey lateral geniculate nucleus cells to luminance and color figures.** *Science*, 1971(Feb), Vol. 171(3972), 684-686. Examined the responses of single units in the monkey lateral geniculate nucleus to different portions of figures which differed from their backgrounds in color and brightness. Border enhancement was found in the response to luminance figures but not in the response to color figures. Cells showed border enhancement only in the case of a figure which produced an increment (as opposed to a decrement) in their firing rates. In situations in which very striking brightness contrast is seen perceptually, the cells do not show the corresponding changes in firing rate across the whole pattern. The lateral inhibitory mechanisms found in the retina and geniculate can thus account for luminance border enhancement, but not entirely for simultaneous brightness or color contrast, for which other cortical processes of some sort must be responsible. *Journal abstract*.

8379 Hulpert, Bruce P. & Tapper, Daniel N. (Cornell U., Section of Neurobiology & Behavior) **Taste stimuli: Quality coding time.** *Science*, 1971(Mar), Vol. 171(3977), 1256-1258. 8 rats, conditioned to avoid drinking 300 millimolar (mM) NaCl, recognized and rejected this solution within 250-600 msec. of onset of stimulus, a period containing the phasic portion of the peripheral neural response. They generalized to 500 mM NaCl but not to 500 mM sucrose. Rejection was based on quality identification neurally encoded within this brief period. *Journal abstract*.

8380 Higgins, J. David, Tursky, Bernard, & Schwartz, Gary E. (Harvard Medical School, Boston, Mass.) **Shock-elicited pain and its reduction by concurrent tactile stimulation.** *Science*, 1971(May), Vol. 172(3895), 866-867. Attenuated human affective reactions to noxious electrical stimulation by application of a tactile stimulus to the shocked site. Ss were 12 healthy 21-30 yr. old males. No alteration was perceived when the same tactile stimulus was applied to a similar contralateral site. These results and a lack of alteration at sensation threshold demonstrate the effect to be more than simple masking and support the Melzack-Wall theory. (18 ref.) *Journal abstract*.

8381 Lane, Ronald H., Allman, John M., & Kaas, Jon H. (U. Wisconsin, Lab. of Neurophysiology) **Representation of the visual field in the superior colliculus of the grey squirrel (*Sciurus carolinensis*) and the tree shrew (*Tupaia glis*).** *Brain Research*, 1971, Vol. 26(2), 277-292. Used microelectrodes to map the representation of the visual field in the superior colliculus (SC) in 2 arboreal diurnal mammals, the grey squirrel and the tree shrew, in which the SC is extremely

well developed. Ss were 12 squirrels and 4 shrews. For comparison, portions of lateral striate cortex of both hemispheres were mapped in the same Ss. Results suggest that the projection of the visual field to the SC both in tree shrew and squirrel differs from that to striate cortex in 2 ways: (a) the complete visual field of each eye appears to be represented in the contralateral SC, while the most nasal 30° of the visual field of each eye is represented in ipsilateral striate cortex; and (b) neurons in the SC are activated only by stimuli to the contralateral eye, while the lateral striate cortex receives input from both the ipsilateral and contralateral eye. The projection to the SC in tree shrew and squirrel resembles that to striate cortex in that the region of the visual field corresponding to the intersection of the line of decussation and the horizontal meridian of the retina is represented in a larger area of the SC than other portions of the visual field. (Georgian Academy of Sciences, Inst. of Physiology, Tbilisi, USSR) *Vliyaniye sinusoidal'noi vibratsii raznoi chastoty i amplitudy na retseptory kozhi.* [The influence of sinusoidal vibration of different frequency and amplitude on the skin receptors.] *Fiziologicheskii Zhurnal SSSR*, 1970(Dec), Vol. 56(12), 1750-1757.—Studied the discharges of afferent fibers during vibration in a slice of skin cut out of the frog back. At the low frequency vibration (4-6 cps) trains of discharges appeared during the augmentation and attenuation of the sinusoidal waves. At higher frequencies (10-14 cps) the discharges only appeared during the augmentation of the vibration waves. At the frequencies higher than 10-14 cps, the discharges of high amplitude (350-400 microV) became irregular. Discharges with amplitude of 150-200 microV ceased to follow each cycle of vibration at the frequency of 30-40 cps. At still higher frequencies, discharges of low amplitude (less than 100 microV) were recorded. At the above frequencies of vibration, some irregular discharges with the amplitude of 250-300 microV were also recorded. During the low amplitude vibration, preferentially irregular discharges of 150-200 microV were observed. At higher amplitude of the vibration, each cycle was succeeded by trains of discharges of different amplitude. It is concluded that augmentation of the amplitude of vibration results in the increase in the number and frequency of discharges in the train.—*Journal summary.*

8384. Mote, Michael I. & Goldsmith, Timothy H. (Yale U.) *Compound eyes: Localization of two color receptors in the same ommatidium.* *Science*, 1971(Mar), Vol. 171(3977), 1254-1255.—The compound eye of the cockroach *Periplaneta americana* has receptors for ultraviolet light (maximum sensitivity at 365 nm.) and green light (maximum sensitivity at 510 nm.). Single photoreceptor cells in the compound eye were impaled, identified by spectral response, and marked with dye-filled microelectrodes. Using 2 different dyes, both types of receptors were found in the same ommatidium.—*Journal abstract.*

8385. Naka, Ken-ichi. (California Inst. of Technology, Div. of Applied Science & Biology) *Receptive field mechanism in the vertebrate retina.* *Science*, 1971(Feb), Vol. 171(3972), 691-693.—In the catfish retina there are 2 types of ganglion cells: (a) in 1 type, a spot of light at the center of its receptive field causes a sustained discharge whereas an annulus causes a transient response; and (b) in the other type, the response pattern is reversed for a spot and an annulus. A study is described in which current injected into the horizontal cell induced spike discharges of the ganglion cell very similar to that elicited by a spot of light or by an annulus. In both types of receptive fields, depolarization of the horizontal cell caused a response of the ganglion cell similar to that elicited by a spot of light, whereas hyperpolarization of the cell caused a response of the ganglion cell similar to that elicited by an annulus. Current through a single injecting electrode could drive 2 types of cells simultaneously. Interaction between a spot of light and an annulus can also be simulated by replacing 1 light stimulus by current of the proper polarization injected into the horizontal cells. Results suggest that interactions among 3 neuronal structures, the receptor, the horizontal cell, and the bipolar cell, produce the basic receptive field organization in the channel catfish.—*Journal abstract.*

BIOCHEMISTRY

8390. Alivisatos, Spyridon G., et al. (Chicago Medical School, Ill.) **Receptors: Localization and specificity of binding of serotonin in the central nervous system.** *Science*, 1971(Feb), Vol. 171(3973), 809-812. In experiments with young adult New Zealand white rabbits and male Swiss mice, it was found that formation of a Schiff base between the ethylanine residue of serotonin and an appropriate carbonyl residue at the receptor site may be among the forces holding serotonin onto the receptor. Reduction of this imine may provide a means of permanently labeling receptors as a preliminary to their isolation. (29 ref.) *Journal abstract*

8391. Jasper, Herbert H. & Tessier, Jacques. (U. Montreal, Quebec, Canada) **Acetylcholine liberation from cerebral cortex during paradoxical (REM) sleep.** *Science*, 1971(May), Vol. 172(3983), 601-602. —The rate of liberation of free acetylcholine from the surface of prostigmin-treated cerebral cortex in the freely moving cat has been determined in states of slow wave sleep, paradoxical or activated sleep, and waking. Results of 9 experiments with 7 cats indicate that the average rate during slow wave sleep (1.2 ng/min square cm of cortical surface) increased during paradoxical sleep (2.2 ng/min) and during waking (2.1 ng/min). The rate of acetylcholine release was related to the EEG pattern of desynchronized activation of the cortex rather than to the behavioral responsiveness of the Ss. *Journal abstract.*

8392. Sherman, Arnold D. (8301 Ridge Blvd., Brooklyn, N.Y.) **Tricarboxylic acid cycle levels following avoidance acquisition by rats.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 301-302. To gain further information on the relationship between intermediary metabolism and acquisition, 15 male Sprague-Dawley rats were trained in a 2-trial avoidance task and sacrificed for chemical analysis. Rough quantitative measures of 5 acids of the tricarboxylic acid cycle were obtained. After the 2nd trial, Ss were assigned to groups by their behavior: passive avoidance, approach, or active avoidance. Kruskal-Wallis analyses of variance indicate that differences in citrate and succinate levels were reliable. It cannot be concluded that results were associated with learning.—*Journal abstract.*

Hormones

8393. Antonov, V. V. (USSR Academy of Medical Sciences, Inst. for Experimental Medicine, Leningrad) **Vozdeistvie estrogenov i androgenov na polovuyu sistemu i polovoe povedenie samok sobak.** [The effect of estrogens and androgens on the gonadal system and sexual behavior in female dogs.] *Fiziologicheskii Zhurnal SSSR*, 1971(Jan), Vol. 57(1), 124-125. —Injected 5 dogs with estrogen and 3 dogs with androgen. Specially active and experienced male Ss were used for testing the sexual desire of females. The factors observed were: the change of the sexual behavior, and change of sexual

organs of the female. It was found that estrogen produced "heat" effect identical to the natural one. Androgen produced similar effects except some secretions present in the natural state were absent, and "male" behavior in the female S was noticeable.—*Halley*

8394. Coleman, Mary S., Pfingst, Bryan; Wilson, John E., & Glassman, Edward. (U. Texas) **Brain function and macromolecules: VIII. Uridine incorporation into brain polysomes of hypophysectomized rats and ovariectomized mice during avoidance conditioning.** *Brain Research*, 1971, Vol. 26(2), 349-360. —Since stimulation of RNA synthesis in animals usually involves a hormonal intermediate, it was felt that hormones might be involved in the observed increases in incorporation of uridine into polysomes and RNA of brain during avoidance training previously reported. Both hypophysectomized male Wistar rats and ovariectomized C57BL/6J mice learned the avoidance response normally and exhibited increases in incorporation of radioactive precursors into brain polysomes when compared with yoked or quiet Ss. Intact female mice did not perform as well as ovariectomized mice and showed random variations in phosphate incorporation into brain polysomes. It is concluded that the adrenal, the pituitary, the testis, and the ovary are not necessary for avoidance conditioning or for the increased incorporation of radioactive precursors into RNA that accompanies it. *Journal summary*

8395. Coover, Gary D., Goldman, Larry, & Levine, Seymour. (Stanford U., Medical School) **Plasma corticosterone increases produced by extinction of operant behavior in rats.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 261-263. Conditioned 31 male Long-Evans rats to lever press for water on a continuous reinforcement schedule. Plasma corticosterone concentrations were determined following reinforced and extinction sessions. All Ss were sampled under both conditions, using a balanced repeated measures design. In addition, the pre-session or basal concentration of plasma corticosterone was measured by 1 subgroup. Plasma corticosterone levels were significantly elevated as a function of extinction, while reinforced responding produced no change compared to the basal level. Results show a major physiological change occurring as a consequence of extinction of an appetitive task. Findings suggest that the pituitary-adrenal hormone system plays a role in extinction of appetitive behavior.—*Journal abstract*

8396. Edwards, David A. (Emory U.) **Neonatal administration of androstenedione, testosterone or testosterone propionate: Effects on ovulation, sexual receptivity and aggressive behavior in female mice.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 223-228. —Exogenously administered androstenedione (AD), testosterone (T), or testosterone propionate (TP) on Days 1, 2, and 3 after birth to 70 neonatal Swiss-Webster mice. 10 control Ss were given oil neonatally. As adults, all Ss were (a) ovariectomized and scored for the presence or absence of ovulation, (b) given estrogen and progesterone and tested for sexual receptivity, and (c) administered TP and tested for aggressive behavior. Ss given TP, T, or AD neonatally were for the most part anovulatory, and, following administration of estrogen and progesterone in adulthood, showed little or no sexual activity. Following androgen stimulation in adulthood, Ss given either TP or

Neonatally showed significantly more aggression than controls. Results support the hypothesis that testosterone, or 1 of its metabolites, is the defeminizing agent in the neonatal male mouse. Analyses of quantitative and qualitative differences in the defeminizing effectiveness of the different steroids are discussed. (15 ref.)—*Journal abstract.*

8399. Michael, Richard P., Keverne, E. B., & Bonsall, R. W. (Bethlem Royal Hosp., Inst of Psychiatry, Beckenham, England) **Pheromones: Isolation of male sex attractants from a female primate.** *Science*, 1971(May), Vol. 172(3986), 964-966.—Fractionation of vaginal secretions from rhesus monkeys by partitioning and chromatographic procedures, combined with behavioral studies, demonstrated that short-chain aliphatic acids were responsible for stimulating the sexual behavior of males. 5 pairs of Ss were used (1 male and 1 female). Injection of estradiol into ovariectomized females increased the concentration of volatile acids in secretions which then sexually stimulated male primates.—*Journal abstract.*

8400. Mugford, Roger A. & Nowell, Norman W. (U. Hull, England) **The preputial glands as a source of aggression-promoting odors in mice.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 247-249. —Conducted 2 experiments to study the previous findings that injection of testosterone propionate (TP) into female mice increases aggressive attacks from males, and the size of their preputial glands. 32 albino spayed female mice injected with TP increased the aggressiveness of previously mated, isolated males. This aggressiveness was reduced by preputialectomy of such females, though not to the level of that elicited by 16 placebo-injected controls. The urine of 24 spayed, TP-injected females was shown to contain an aggression-eliciting pheromone, which induced 33 male fighter mice to increase their aggressiveness towards castrate male opponents. The effectiveness of this pheromone was not reduced by preputialectomy. It is concluded that androgens can

stimulate the release of aggression-eliciting pheromone from 2 sources in the female: (a) from the preputial glands, which may act as a social signaling device during agonistic encounters; and (b) in the urine, which may control wider aspects of behavior in mouse populations. —*Journal abstract.*

8401. Payne, A. P. & Swanson, Heidi H. (U. Birmingham, England) **Hormonal control of aggressive dominance in the female hamster.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 355-357.—The intact sexually unreceptive female hamster is aggressively dominant over the male. The dominance patterns of 18 spayed female golden hamsters and their response to various hormones were studied. Ss were sequentially given no treatment, 4 graduated doses of progesterone, testosterone (TP), and estradiol benzoate. Untreated and TP treated Ss were beaten in aggressive encounters with intact males. When given progesterone, Ss became dominant over males. Estradiol benzoate produced a lordotic response, which provoked mounting by males and a lowering in the frequency of agonistic behavior by both animals. It is suggested that the dominance observed in progesterone-treated Ss may be the result of (a) the effect of the hormone on the female's behavior, or (b) the effect on male behavior of changes in olfactory cues. (16 ref.)—*Journal abstracts*.

8402. Sandman, Curt A., et al. **Electroencephalographic measures of melanocyte-stimulating hormone activity.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 103-109. Studied EEG changes in 28 male albino rats after injections of melanocyte-stimulating hormone (MSH). Following chronic electrode placement, a base-line and sham-injected EEG pattern was obtained. 8 Ss then received MSH and 2 Ss received a vasopressin control solution. Results indicate that MSH produced an increase in 4-9 Hz. high-voltage activity which had specific temporal parameters. The pattern of the EEG following MSH injection was similar to limbic system electrical activity. (30 ref.)—*Journal abstract.* *Index Medicus*, 1971, 75(10), 103-109. *Author*, Thomas, & Walker.

8403. Wilson, Wayne; Peters, Thomas, & Walker, Dwight. (Stephen F. Austin State U.) Social dominance of castrate rats under testosterone cyponate. *Psychonomic Science*, 1971(Apr). Vol. 23(1B), 121-123. — Saturated 20 pairs of Sprague Dawley castrate and castrate-sham rats. Ss then received 8 contests in the dominance tube and 1 encounter in the home cage of the castrate. After injections of testosterone cyponate to castrates and placebo treatment of shams, high-dosage castrates displayed more effective dominance activity than did low-dosage castrates in the 2nd home-cage test. Data pertaining to posthormone tube contests and to uniform dominance outcomes across both tasks were inconclusive. *Journal abstract.*

8404. Zumpe, D. & Michael, Richard P. (Bethlem Royal Hosp., Inst of Psychiatry, Kent, England). Ovarian hormones and female sexual invitations in captive rhesus monkeys (*Macaca mulatta*). *Animal Behaviour*, 1970(May), Vol 18(2), 293-301. Ovariectomized females were observed in 588 60-min tests of sexual invitation. Presentations, hand reaches, and head-ducks increased after estradiol treatment and decreased after addition of progesterone. Sometimes progesterone was stimulating at lower doses changing to suppression as doses were increased. Progesterone alone abolished hand reaches, head-ducks, and head bobs. These 3 invitations were positively correlated with each

other but not with presentation. It is suggested that these 3 gestures are ritualized components of threat behavior serving exclusively a sexual initiative function, and the total invitations are a more useful index of female receptivity than presentations alone (16 ref.)—*M. Strobil.*

Drug Effects—Human

8405 Ehrenstein, W., Müller-Limmroth, W., & Schaffler, K. (Technical Coll. Inst. of Labor Physiology, Munich, W. Germany) **Ein elektrophysiologischer Beitrag über die Wirkung von 7-Chlor-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-on auf den Tagsschlaf nach einer Nachtschicht.** [An electrophysiological contribution to investigation on the effect of 7-chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one on the sleep during daytime following a night shift.] *Arzneimittel Forschung*, 1969(Oct), Vol. 19(10), 1656-1659. By means of 3 representative examples obtained from 1 S, the influence of 10-mg 7-chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one (adumbran) on day sleep was demonstrated in some night nurses of a surgical hospital. The experiments are part of a study comprising a total of 80 sleep registrations obtained from 8 Ss. Under laboratory conditions, day sleep without pharmacological support was, in most cases, only slightly shortened compared to night sleep; paradox sleep and deep sleep, however, were remarkably shorter. In contrast to night sleep, day sleep was interrupted by frequent waking periods, showed 5 sleep cycles of 100-min duration on the average vs. 3 cycles of 139 min on the average in the night and, above all, lacked deep sleep in the 2nd of sleep almost entirely. Motor activity during the day was reduced by approximately 30% compared to night sleep. Adumbran administered 1 hr before day sleep normalized the duration of paradox sleep, lengthened the deep sleep in the 2nd of sleep, though not to the full duration observed in night sleep, and decreased number and duration of waking phases. It did not shorten the periods compared with those of night sleep. It increased heart and respiration rate without influencing the heart beat respiration ratio, and slightly increased the motor activity during sleep, which, nevertheless, remained far below that seen in night sleep. Results show that adumbran markedly improved the badly disturbed day sleep of the night worker but could not accomplish a complete normalization adequate to night sleep.—*English summary.*

8406. Hollister, Leo E. (Veterans Administration Hosp., Palo Alto, Calif.) **Marihuana in man: Three years later.** *Science*, 1971(Apr), Vol. 172(3978), 21-29. Discusses the past 3 yr. of research on the effects of marihuana in man. Major advances have been (a) a quantification of dose in relation to clinical phenomena, and (b) a beginning of an understanding of the drug's metabolism. Crucial clinical experiments in regard to social questions about marihuana, e.g., the possible deleterious effects from chronic use, cannot be answered by laboratory experiments, but must be settled by observation of those who experiment on themselves. The possibility of determining whether marihuana has any medical utility is discussed. Mechanisms by which marihuana alters mental functions are not likely to be answered in man, nor even answered soon by animal studies. Marihuana is unique among drugs in that more experimentation has been accomplished in man than in

animals. It may be necessary, however, to use additional animal studies to provide leads for pertinent human studies in man. (46 ref.)—*Journal summary.*

8407. Kamm, G. & Keim, R. (U. Marburg Inst. of Forensic Medicine, W. Germany) **Quantitativer Nachweis von 7-Chlor-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-on im Plasma bei einmaliger und längerer Verabreichung.** [Quantitative analysis of 7-chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one in plasma after a single dose and continued application of the drug.] *Arzneimittel Forschung*, 1969(Oct), Vol. 19(10), 1659-1662.—Report on the quantitative estimation of 7-chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one (adumbran) in blood plasma after acid hydrolysis, thin-layer chromatography, and transformation into an azo dye by reaction of the bluish purple spots and subsequent spectrophotometry of the colored solutions. With this technique, adumbran levels in blood were determined in 2 different groups of 5 persons each after oral and rectal application of the drug. Under continuous application of small doses of adumbran no accumulative effect was observed.—*English summary.*

8408. Levi, Lennart. (Karolinska Inst., Stockholm, Sweden) **Emotional stress and biochemical reactions as modified by psychotropic drugs with particular reference to cardiovascular pathology.** *Excerpta Medica International Congress Series*, 1968, No. 182, 206-220.—Reviews a series of experiments which attempted "to determine whether biochemical and physiological reactions supposedly participating in the pathogenesis of such internal medical disorders may, indeed, be provoked by psychological stimuli, and secondly, whether these reactions can be therapeutically modified by psychotropic and vegetotropic drugs. Stimuli included: (a) simulated industrial and office work; (b) actual working situations in various occupations; (c) public appearance; (d) film programs inducing anxiety, aggressiveness, amusement, or erotic emotions; (e) simulated flight with simultaneous control of an aircraft and a guided missile; (f) prolonged function under simulated ground combat conditions; and (g) control conditions of relaxation and rest. The psychological and biochemical reactions induced were studied when modified by: (a) tranquilizers (diazepam, oxazepam, opipramol, hydroxyzine, and fluphenazine); (b) sympathomimetics (caffeine, phenmetrazine, methylphenidate, N-ethylnormetaoxedrine, yohimbine, and LSD); (c) adrenergic blocking drugs (propranolol) and (d) antipolytic drugs (nicotinic and clofibrinic acid). 8409. Murphy, E. H. & Venables, P. H. (Stanford U. Medical Center) **The effects of caffeine citrate and white noise on ear asymmetry in the detection of two clicks.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 27-32.—Found in previous studies that when 1 or 2 clicks are presented monaurally with white noise in the contralateral ear, there is considerable decrement in the change in detection for the left ear in comparison to the performance without contralateral noise. 36 right-handed male and female undergraduates performed a signal detection task. An inverted U function was obtained when performance was tested with placebo, 375 or 500 mg. of caffeine citrate, for right and left ear, with and without white noise. The relative superiority of the right ear performance without caffeine citrate or white

noise was significantly correlated with right ear decrement with caffeine citrate or white noise. Results are discussed with reference to strength of the nervous system, arousal and differentiation of function of the right and left cerebral hemispheres. 8410. Trentini, Giancarlo; Carli, Renzo, & Padovani, Franco. **Contributo sperimentale alla ricerca degli effetti dell'alcool nelle strutture relazionali dell'ego con la realtà sociale e con il principio d'autorità.** [Experimental contribution to research on the effects of alcohol on the relational structures of the ego with social reality and with the authority principle.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 513-547.—McClelland's test of imagination and a modification of Rosenzweig's Picture Frustration Study were administered to 120 male college students divided into experimental and control groups. The former drank alcohol and consequently expressed a lowered need for power and need for achievement with an increment in affiliative-dependent motivations. The power of authority figures was also decreased as a result of the increased ego strength due to alcohol. (44 ref.)—L. L'Abate.

8411. Trentini, Giancarlo & Vegetti Finzi, Silvia. **Contributo sperimentale allo studio degli effetti dell'alcool sulla psicodinamica dell'individuo normale.** [Experimental contribution to the study of the effects of alcohol on the psychodynamics of the normal individual.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 548-597.—In normal individuals, alcohol intake noticeably increased the strength of the individual in front of authoritarian figures, rendering him more tolerant, harmonious, and productive. Authority figures seemed to be perceived as weaker, more vulnerable, less rigid, less productive, and less controlled. (40 ref.)—L. L'Abate.

8412. Woody, George E. (Southwest Counseling Center, Philadelphia, Pa.) **Visual disturbances experienced by hallucinogenic drug abusers while driving.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 683-686. Presents 3 case reports of young men with histories of hallucinogen usage who experienced visual disturbances while driving. None was "high" at the time of the experience. It is likely that the disturbances were due to recurrences of the acute effects of 1 or more hallucinogens. It is believed that use of these drugs may be introducing a new driving hazard. (17 ref.)—*Journal abstract*.

Drug Effects—Animal

8413. Adams, P. M. & Crawford, F. T. (U. Texas, Medical Branch, Galveston) **Spontaneous activity and water intake in the rat under the effects of scopolamine HBr and magnesium pemoline.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 111-112.—Conducted 2 experiments with a total of 12 male albino rats to analyze the effects of scopolamine HBr and magnesium pemoline on spontaneous activity and water intake. Both drugs were found to increase the level of intake. Both drugs were found to increase the level of wheel running but with different temporal parameters. Water intake was increased by magnesium pemoline, whereas scopolamine decreased the amount of water consumed during the activity increase. The interpretation of drug effects on performance in appetitive and nonappetitive reward situations is discussed.—*Journal abstract*.

8414. Aeppli, Lislott. (J. R. Geigy, Scientific Lab., Basel, Switzerland) **Teratologische Studien mit Imipramin an Ratte und Kaninchen: Ein Beitrag zur Planung und Interpretation teratologischer Untersuchungen unter Berücksichtigung von Biochemie und Toxikologie der Prüfsubstanz.** [Teratologic studies on imipramine in rats and rabbits: A contribution to layout and interpretation of teratologic studies with special consideration of biochemistry and toxicology of the test substance.] *Arzneimittel-Forschung*, 1969(Oct), Vol. 19(10), 1617-1640.—Following introductory notes on metabolism, toxicology, and reproduction toxicology of 5-(3-dimethylaminopropyl)-10,11-dihydro-5H-dibenz[b,f]azepine by hydrochloride (imipramine), studies on this substance and its 2 chief metabolites, desmethyl-imipramine (DMI) and 2-hydroxyimipramine (2-OH-IP), performed on pregnant rats and rabbits are reported. Under the test conditions, neither imipramine nor DMI nor 2-OH-IP administered orally or subcutaneously (sc) showed direct embryotoxic effects in the rat. The increase of the resorption rate and number of fetuses with abnormalities (mainly signs of immaturity of the skeleton) occurred only at doses that were toxic for the mother S. It is shown that very probably the resorptions were effected by a direct, toxic activity of imipramine on the embryo before malformations could develop. Under similar test conditions in the rabbit with sc injection of imipramine, DMI, and 2-OH-IP, it can be assumed that increased resorption and malformations rate were of secondary toxic nature, i.e., they were the consequences of toxic impairment of the mother Ss probably induced by the metabolite 2-OH-IP. This substance is the main metabolite of imipramine and shows a stronger secondary teratogenic potency than the mother substance. It is emphasized that for an extrapolation from teratologic animal tests to conditions in man, only those experiments whose layout takes into consideration pharmacodynamics, toxicology, and metabolism of the test substance possess optimal value. (88 ref.) *English summary*.

8415. Barnes, C. D. & Moolenaar, Gwen M. (Indiana U.) **Effects of diazepam and picrotoxin on the visual system.** *Neuropharmacology*, 1971(Mar), Vol. 10(2), 193-201. Investigated the effects of diazepam (1 mg/kg iv) followed by picrotoxin (1 mg/kg iv) on the temporal alterations of shock-evoked cortical potentials after a flash of light in 18 pretrigeminal cats. In the dark-adapted state, a light flash produced a facilitation of more than 1500 sec., followed by a slight depression of the evoked cortical potential obtained by optic tract stimulation. The administration of diazepam resulted in a marked facilitation of the optic-tract-evoked cortical potential after light stimulation. In the light-adapted state, a light flash produced a large facilitation followed by a depression of the evoked cortical potential obtained by retinal stimulation. Diazepam administration greatly depressed the early postflash facilitation, but had little effect on the late depression. The administration of picrotoxin after diazepam tended to reverse the effects of diazepam. Results appear to support the hypothesis that diazepam results presynaptically inhibit inhibitory optic tract fibers in the lateral geniculate nucleus. A 2nd site interneurons in the lateral geniculate nucleus. The effect of the diazepam and picrotoxin effect is the retina, possibly at axo-axonic synapses between amacrine cells and bipolar cells. (32 ref.) *Journal abstract*.

8416. Bauer, Ellen R. & Reynolds, E. Vicar. (Coll of William & Mary) **D-amphetamine and palatability of**

saccharin solution. *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 3-4.—Randomly assigned 24 female albino rats to receive a 7-day series of 3 mg/kg injections of either d-amphetamine sulfate in isotonic saline or saline ip. of each group drank 1% sodium saccharin solution, the others water. Food intakes were analyzed as intake unit/body weight. No differences were found among groups prior to drug administration. The prediction that d-amphetamine would produce a taste-conscious animal was not substantiated. D-amphetamine produced a decrease in saccharin intake and an increase in water intake relative to saline controls. *Journal abstract*

8417 **Baum, Morris.** (Bishop's U., Lennoxville, Quebec, Canada) **Effect of alcohol on the resistance-to-extinction of an avoidance response: Replication in mice.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 307-309.—Gave 45 AKR and 45 A/JAX female mice 1 of 3 doses of alcohol following the acquisition of a simple avoidance response in an automated apparatus. The appropriate dose of alcohol increased the persistence of the avoidance response in extinction, replicating in mice what had previously been found with rats. Results question the view that alcohol acts to decrease fear in rodents. *Journal abstract*

8418 **Bliss, David A., Sledjeski, Michael, & Lerman, Arnold L.** (State U., New York, Binghamton) **State-dependent choice behavior in the rhesus monkey.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 51-59.—Gave 4 rhesus monkeys a series of successive brightness reversals after ip injections of pentobarbital or saline on alternate reversals. Ss showed no evidence of interference from 1 reversal to the next. It is suggested that a change of drug state permits independent (dissociated) learning to occur in each state. Retention of an appropriate cue within a state was remarkably good even when an S's immediately preceding experience was training to another cue while in the alternate state. Retention appears to be state-dependent. (French & German summaries) (16 ref.) *Journal abstract*

8419 **Boggan, William O. & Seiden, Lewis S.** (U. Chicago) **Dopa reversal of reserpine enhancement of audiogenic seizure susceptibility in mice.** *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 215-217.—Evaluated the role of L-dopa and dopamine (DA) in the audiogenic seizure susceptibility of 249 DBA/2 and 121 DBA/1 mice. Increased sensitivity to audiogenic seizures induced by reserpine was antagonized by L-dopa. The antagonism was dependent upon the conversion of L-dopa to DA in brain since blockade of both cerebral and extracerebral decarboxylase prevented the L-dopa effect, whereas blockade of extracerebral decarboxylase only did not affect the L-dopa antagonism. Increased seizure susceptibility occurred when brain levels of norepinephrine and DA were significantly lowered, while decreased susceptibility was found when brain levels of DA were significantly elevated. Results indicate that DA plays a role in protection against audiogenic seizures in mice. (17 ref.) *Journal abstract*

8420 **Brown, Kenneth & Warburton, David M.** (Queen's U., Belfast, Ireland) **Attenuation of stimulus sensitivity by scopolamine.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 297-298.—Trained 5 adult male Wistar albino rats on a DRI, 15-sec schedule of reinforcement. Ss were then injected with 6 doses of scopolamine hydrobromide. Analysis of results by means

of signal-detection theory indicate that the effects are due to attenuations of stimulus sensitivity rather than changes in response bias. This is interpreted as evidence against a response-inhibition hypothesis and suggests that there were changes in the stimulus input.—*Journal abstract*

8421 **Carroll, Bernard J. & Sharp, Peter T. U.** (Melbourne, Royal Melbourne Hosp., Victoria, Australia) **Rubidium and lithium: Opposite effects on amine-mediated excitement.** *Science*, 1971(Jun), Vol. 172(3940), 1355-1357.—In an experiment with naive male albino Swiss mice, the activation caused by morphine was antagonized by previous treatment with lithium ($N = 6$) and potentiated by previous treatment with rubidium ($N = 6$). Other antimanic drugs also antagonized the morphine activation. The effect of rubidium was similar to that of the antidepressant drugs imipramine and pargyline. It is concluded that rubidium may merit clinical evaluation as an antidepressant agent in man. (22 ref.)—*Journal abstract*

8422 **Clark, George; Koester, Anna G., & Pearson, David W.** (Medical Coll. of South Carolina, Charleston) **Exploratory behavior in chronic disulfoton poisoning in mice.** *Psychopharmacologia*, 1971, Vol. 20(2), 164-171.—Compared the behavior of 4 male and 4 female groups (10-12 Ss each) of naive Charles River white mice, using the "hole-board" test. 1 male and 1 female group were chronically poisoned with disulfoton while similar untreated male and female groups served as controls. The scores of the poisoned Ss were significantly higher than those of the controls, indicating that the poisoned Ss exhibited increased exploratory behavior. There were no sex differences. *Journal abstract*

8423 **Cooper, Barrett R., Black, William C., & Paulino, Ronald M.** (Purdue U.) **Decreased septal-forebrain and lateral hypothalamic reward after alpha methyl-p-tyrosine.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 425-429.—Trained 12 male Long-Evans rats to respond for rewarding electrical brain stimulation to either the lateral hypothalamus (LH) or septal-forebrain (SF) using a rate-free measure. Administration of DL-alpha methyl-p-tyrosine produced a dose-dependent decrease in responding for stimulation at both sites. The magnitude of this decrease was found to be dependent upon both electrode placement and the current intensity of stimulation. DL-p-chlorophenylalanine did not produce any significant changes in performance. Results are consistent with a hypothesis of noradrenergic basis of reward despite the reported behavioral and other differences accompanying self-stimulation of LH and SF in bar-pressing situations. (19 ref.)—*Journal abstract*

8424 **Csaba, B., Tóth, S., & Molnár, G.** (University Medical School, Inst. of Pathophysiology, Debrecen, Hungary) **Benzocyclan, a new anti-serotonin drug: A pharmacological study on the effect of benzocyclan in relationship to its anti-serotonin properties.** *Arzneimittel-Forschung*, 1969(Oct), Vol. 19(10), 1726-1728.—Studied the antiserotonin effect of 1-benzyl-1-(3'-dimethyl-aminopropoxy)-cycloheptane fumarate (benzocyclan, B). In 200-300 fold dosage B reversibly inhibited contraction of rat fundus ventriculi strips induced by serotonin. Inhibition was of a competitive nature, because the protective effect of B could be overcome by massive doses of serotonin. Anaphylactoid reaction to dextran was completely inhibited in rats by 4

mg/kg B. Since serotonin is the chief mediator in provoking inflammatory edema, B is also capable of antagonizing the effect of serotonin released in vivo. Increase of capillary permeability due to serotonin was significantly inhibited by B which, however, failed to influence the similar activity of histamine. Results having been compared to the effects of methysergide, a specific antiserotonin agent, B was found to exert a pronounced antiserotonin effect similar to that produced by equal doses of methysergide. Premedication with B protected guinea pigs from the dyspnea-eliciting effect of serotonin aerosol. B was observed to exert in vivo a mild sedative action after the use of doses which produced a marked antiserotonin effect. Motility was reduced and the Ss reacted only to intensive pain stimuli. No other side effect was discovered at autopsy.—*English summary.*

8425. Dallemagne, Ghislaine. (U. Liège, Inst. of Experimental Therapeutics & Lab. of Experimental Psychology, Belgium) *Traitement prolongé à la morphine chez le rat: Interaction drogue/comportement dans des conditionnements sous contrôle aversif.* [Prolonged treatment with morphine in rats: Drug/behavior interaction under aversive control.] *Psychopharmacologia*, 1971, Vol. 20(1), 77-84.—Conditioned 4 female albino Wistar rats alternately on a titration schedule and on a Sidman avoidance schedule, without warning stimulus, in a circular box. Morphine (15 mg/kg daily) was administered for 30 consecutive days, and again for 4 days after 22 sessions of conditioning without drugs. In a circular box, the excitation induced by morphine showed a slow daily decrease suggesting development of tolerance. In the titration schedule, responding was depressed by the drug. After a few days, the rate of responding increased and the depression was reversed to excitation. When the drug was withdrawn, Ss showed a pattern of behavior close to the normal base line. The same effects appeared when morphine was injected after 6 wk. interruption of treatment.—*English abstract.*

8426. Davis, John W., Thomas, Roger K., & Adams, H. E. (U. Georgia) *Interactions of scopolamine and physostigmine with ECS and one trial learning.* *Physiology & Behavior*, 1971(Mar), Vol. 6(3), 219-222.—Trained 12 groups of 10 male Sprague-Dawley rats on a 1-trial, passive avoidance task and tested for retention 4 hr. later. 6 groups received ECS immediately following the learning trial, and the remaining 6 groups were in a non-ECS condition. Both the ECS and non-ECS groups were divided into 3 groups which received saline, scopolamine, or physostigmine injections before the learning trial and 3 groups which received the injections before the retention trial. Results suggest that injections before the retention trial of scopolamine or physostigmine prior to the learning trial protected memory from the prior to the retention trial protected memory from the normally disruptive effects of ECS. Scopolamine alone before the learning trial or physostigmine alone before the retention trial had a disruptive effect on retention. Results are discussed in terms of influences of the drugs and/or ECS on acetylcholine activity.—*Journal abstract.*

8427. Delini-Stula, A. (Ciba-Geigy Ltd., Pharmaceutical Div., Basel, Switzerland) *Drug-induced suppression of conditioned hyperthermic and conditioned avoidance behavior response in rats.* *Psychopharmacologia*, 1971, Vol. 20(2), 153-159.—Investigated the influence of different drugs on conditioned avoidance behavior and hyperthermia in male albino Wistar rats. A

specific blocking of conditioned avoidance responses was observed with neuroleptic drugs, but, except for chlorpromazine and thioridazine, they did not affect the conditioned temperature rise. Benzodiazepine derivatives and meprobamate consistently suppressed the hyperthermia at doses which did not impair conditioned avoidance behavior. Among other psychoactive drugs only imipramine (10 mg/kg ip) and desipramine (5 mg/kg ip) have shown an inhibitory effect on hyperthermia. The conditioned behavioral response was not influenced. Phentolamine at higher doses slightly suppressed the temperature rise. Morphine and aspirin were inactive regarding both parameters tested. (18 ref.)—*Journal abstract.*

8428. Elias, Merrill F. & Simmerman, Scott J. (Duke U., Medical Center) *Proactive and retroactive effects of diethyl ether on spatial discrimination learning in inbred mouse strains DBA/2J and C57BL/6J.* *Psychonomic Science*, 1971(Mar), Vol. 22(5), 299-301.—Describes 2 experiments with a total of 96 male DBA/2J and C57BL/6J mice. Diethyl ether was given before or after a single daily spatial discrimination trial in a water maze. Both C57BL/6J and DBA/2J Ss made more errors than controls when they were etherized after a trial, although the decremental effect on performance was more notable in the former strain. Pretrial etherization had no effect on errors, but Ss etherized prior to each trial showed faster swimming times than controls. Data are discussed in terms of strain differences in ether-stimulated arousal or activity level. (16 ref.)—*Journal abstract.*

8429. Etcevenon, P. & Boissier, J. R. (Neuro-Psychopharmacology Research Unit, Paris, France) *Statistical amplitude analysis of the integrated electrocorticogram of unrestrained rats before and after prochlorperazine.* *Neuropharmacology*, 1971(Mar), Vol. 10(2), 161-173. The method of statistical amplitude analysis is developed and applied to the study of vigilance fluctuations in the normal rat. These are then compared with the cataleptic state produced by prochlorperazine. Ss were 12 male Wistar albino rats. With unrestrained Ss, the comparison between the time courses of the integrated electrocorticogram (ECOG) and neck muscles EMG, provided precise and objective data for the measurement of vigilance phases (arousal, sedation, slow and paradoxical sleep) as well as drug effects. After prochlorperazine administration a characteristic steady state of the ECOG and EMG appeared. Compared with the normal S, the integrated ECOG and EMG was much less variable and this effect persisted together with the cataleptic state, which is recognized by the crossing of homolateral legs. The statistical amplitude analysis was based on comparative histograms and repartition functions (cumulative frequency curves) plotted on probability paper. The mean (voltage) integrated amplitude values were the quantified ECOG and EMG, integrated each 20-sec period. Graphic comparison was completed by numerical statistical analysis of data (Student's t-test, Snedecor's F test, and chi-square goodness of fit). This method allows discrimination between drug effects and normal vigilance fluctuations. When catalepsy decreased, normal cortical and EMG variability resumed. (29 ref.) *Journal abstract.*

8430. Evangelista, A. M. & Izquierdo, I. (National U., Inst. of Chemical Sciences, Córdoba, Argentina) *The*

effect of pre- and post-trial amphetamine injections on avoidance responses of rats. *Psychopharmacology*, 1971, Vol. 20(1), 42-47.—Describes an experiment with

223 adult albino rats in which Ss were trained in a shuttle-box to avoid shocks and then retested 3 days later for retention. A pretrial injection of 2 mg/kg amphetamine increased the performance of CRs on the 1st day but did not improve retention beyond control levels. A similar posttrial injection, however, caused a marked enhancement of retention, even in Ss which had received a pretrial amphetamine treatment. Atropine potentiated the effect of pretrial amphetamine on performance during the 1st-day session, but partly antagonized that of posttrial amphetamine on retention. The effects of pretrial amphetamine and its interaction with atropine were similar to previously reported observations on pseudocconditioning. Amphetamine was considered to have a dual effect on behavior: (a) an enhancing effect on pseudocconditioning which could be potentiated by atropine, and (b) another stimulant action on memory consolidation which was counteracted by atropine. Under the conditions of the present experiment it was to be expected that the effect of pretrial amphetamine on the performance of avoidance responses on the 1st day would be due to an increase of pseudocconditioned responses and therefore would not improve retention of CRs over control levels. A higher dose (5 mg/kg) of amphetamine lacked all facilitatory action on learning. The effects of atropine by itself were dose-dependent on pretrial injection to low dose depressions), a higher dose enhanced performance on both sessions), and was stimulant upon retention upon posttrial treatment. *Journal abstract*

8431 Florio, V. & Longo, V. G. (Istituto Superiore di Sanità Lab. di Chimica Terapeutica, Rome, Italy) Effects of amantadine and of some synthetic antiparkinsonian drugs on the behavioral response to L-dopa in mice. *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 465-466.—Assigned 184 male white mice to groups receiving various doses of amantadine and synthetic antiparkinsonian drugs (e.g. imipramine, atropine, and amitriptyline). Ss then received ip injections of L-dopa and their behaviors were observed. It was found that amantadine, as well as other antiparkinsonian drugs, potentiate the effects of L-dopa in mice. Possible mechanisms of action are discussed. *Journal abstract*

8432 Gallup, Gordon G., Nash, Richard F., & Brown, Charles W. (Tulane U.) The effects of a tranquilizer on the immobility reaction in chickens: Additional support for the fear hypothesis. *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 127-128.—Examined the duration of the immobility reaction following manual restraint in 41 Production Red chicks. Ss were assigned to 1 of 4 groups receiving 0, 1, 2, or 4 mg/kg of metoserpate HCl (pacitran). In terms of number of inductions needed to elicit the immobility response, Ss given Pacitran were found to be significantly less susceptible to immobility than controls. The duration of reactions was inversely related to drug dosage levels, with controls remaining immobile over 3 times longer than Ss receiving an optimal dosage. Results are interpreted as supporting the notion that fear underlies tonic immobility reactions in young chicks. *Journal abstract*

8433 Giurgea, C., Lefevre, D., Lescrenier, C., & David-Remacle, M. (Louvain, Belgium) Pharmacological protection against hypoxia induced amnesia

in rats. *Psychopharmacology*, 1971, Vol. 20(2), 9-16.—Used a 1-min stimulus, presented about 30 times trial in a constant conditioning situation, to test 8 male Wistar rats to avoid an electric shock. In a 2nd group of 8 Ss, hypoxia was used daily at the end of each trial (immediate hypoxia) as an amnesic agent. In a 3rd group of 8 Ss, a similar daily hypoxic treatment was used but delayed 6 hr after the trial (delayed hypoxia). In immediate hypoxic conditions, 3 groups of 24 rats were treated with piracetam (U CB 6215) at respectively 100, 300, and 500 mg/kg given orally, daily, 30 min before each trial. Results indicate that (a) immediate hypoxia strongly impaired learning in untreated Ss, (b) delayed hypoxia did not interfere with learning, thus supporting the interpretation of the effect of immediate hypoxia as being as an amnesic one; and (c) Ss completely protected against immediate hypoxia, as judged by their learning performance. The protective memory-consolidation effect of piracetam is discussed based on the pharmacology of this new compound. *Journal abstract*

8434 Goldstein, Avram & Judson, Barbara A. (Stanford U.) Alcohol dependence and opiate dependence: Lack of relationship in mice. *Science*, 1971(Apr), Vol. 172(3980), 290-292.—According to a recently proposed hypothesis physical dependence upon alcohol is due to the formation of an endogenous opiate. 40 male Swiss Webster mice served as Ss in 2 experiments. This hypothesis was tested by determining whether or not ethanol-dependent Ss would show typical opiate-dependent behavior (withdrawal jumping syndrome) when challenged with the opiate antagonist naloxone. Results do not support the hypothesis. *Journal abstract*

8435 Goldstein, Dora B. & Pal, Nandita. (Stanford U. Medical School) Alcohol dependence produced in mice by inhalation of ethanol: Grading the withdrawal reaction. *Science*, 1971(Apr), Vol. 172(3980), 288-290.—Results of an experiment with 20 mice indicate that intoxicating blood levels of ethanol were maintained for several days in Ss housed in an atmosphere of ethanol vapor. On removal from the alcohol, all Ss developed withdrawal signs. The signs were graded to indicate the time course and intensity of the withdrawal reaction. *Journal abstract*

8436 Gray, J. A. & Dudderidge, Hilary. (Inst. of Experimental Psychology, Oxford, England) Sodium amylobarbitone, the partial reinforcement extinction effect, and the frustration effect in the double runway. *Neuropharmacology*, 1971(Mar), Vol. 10(2), 217-222.—32 male rats were trained to run in a double runway for food rewards, and the learned response was subsequently extinguished in the 1st runway only. During training, the Ss were given CRF in the 1st goalbox and were given random 50% partial reinforcement. Of each of these groups, 1/2 were injected with sodium amylobarbitone (15 mg/kg ip) daily during acquisition of the response and 1/2 were injected with saline. All Ss were continuously reinforced with saline during goalbox and all were injected with saline during extinction. During acquisition, the partially reinforced Ss displayed greater running speed in the 2nd runway after a nonreward than after reward in the 1st goalbox (a double-runway frustration effect); they also increased their resistance to extinction in the 1st runway. Amylobarbitone attenuated the increased resistance to

extinction due to PRE but did not affect the double-runway frustration effect. (22 ref.)—*Journal abstract.*

8437. Greef, K. & Wagner, J. (U. Düsseldorf, Inst. of Pharmacology, W. Germany) **Cardiodepressive und lokalanaesthetische Wirkungen der Thymoleptica: Vergleichende Untersuchungen mit Imipramin, Desipramin, Amitriptylin, Nortriptylin und Melitracen.** [Cardiodepressive and local-anesthetic effects of thymoleptic drugs: A comparative study with imipramine, desipramine, amitriptyline, nortriptyline and melitracene.] *Arzneimittel-Forschung*, 1969(Oct), Vol. 19(10), 1662-1664.—At concentrations of 1, 3, or 10 µg/ml, respectively, the thymoleptic drugs, imipramine, desipramine, amitriptyline, nortriptyline, and melitracene caused a dose dependent reduction of contractility and beat rate in isolated, spontaneously beating atrium preparations of the guinea pig. At the same time, thymoleptic drugs enhanced the positively inotropic and chronotropic effects of noradrenaline, whereas, with the exception of melitracene, they reduced or even canceled those of tyramine. On the rabbit cornea all thymoleptic drugs show a cocaine-like, surface-anesthetic effect. (15 ref.)—*English summary.*

8438. Gusel', V. A. (Leningrad Pediatric Medical Inst., USSR) **Vliyaniye veshchestv, vzaimodeistviyushchikh s serotoninno-reaktivnymi sistemami, na èpileptiformnye razryady v gippokampe krolikov.** [Influence of substances, interacting with serotonin-reactive systems, on epileptiform discharges in the rabbit hippocampus.] *Farmakologiya i Toksikologiya*, 1971(Mar), Vol. 34(2), 135-139.—16 rabbits with a chronic epileptogenic focus in the hippocampus and 8 control rabbits were Ss in a study to determine whether (a) serotonin-reactive systems are involved not only in normal hippocampal functions, but also in the formation of pathological hypersynchronous activity therein, and (b) pharmacological agents, interacting with serotonin-reactive systems, exert an influence on epileptiform activity. 5-oxytryptophan (5-OTP, a serotonin precursor), 5-metoxitryptamine (mexamine; a serotoninmimetic), and 1-2 mg/kg reserpine iv inhibited the sporadic hippocampal epileptiform activity. However, repeated administration of .1 mg/kg reserpine sharply intensified the pathological activity. Iprazid, iv, increased hippocampal epileptiform activity. (English summary) (17 ref.)—*J. D. London.*

8439. Henriksson, Bengt G. & Järbe, Torbjörn. (U. Uppsala, Sweden) **Effects of diazepam on conditioned avoidance learning in rats and its transfer to normal state conditions.** *Psychopharmacologia*, 1971, Vol. 20(2), 186-190.—16 male Sprague-Dawley albino rats trained in conditioned avoidance responding (CAR) after injections of diazepam, 10 mg/kg, showed little or no transfer when tested in the nondrugged state. In this moderate dose diazepam did not significantly facilitate the acquisition of CAR nor did it decrease already established avoidance behavior.—*Journal abstract.*

8440. Hockman, Charles H., Perrin, Richard G., & Kalant, Harold. (U. Toronto, Brain Research Lab., Ontario, Canada) **Electroencephalographic and behavioral alterations produced by Δ^1 -tetrahydrocannabinol.** *Science*, 1971(May), Vol. 172(3986), 968-970.—Reports that the administration of small doses of Δ^1 -tetrahydrocannabinol to cats with indwelling electrodes produced a disruption of both the EEG and behavior. Some of these alterations, including the appearance of a high-voltage slow wave EEG in the awake and moving S, have been observed in cats that

had been administered other drugs known to cause hallucinogenic states in man.—*Journal abstract.*

8441. Irwin, Samuel; Kinohi, Roberta; Van Sloten, Margaret, & Workman, Mary P. (U. Oregon, Medical School, Portland) **Drug effects on distress-evoked behavior in mice: Methodology and drug class comparisons.** *Psychopharmacologia*, 1971, Vol. 20(2), 172-185.—Attempted to establish the optimal conditions of continuous foot shock stimulation (3 min. at .08 ma.) for investigating drug effects on distress-evoked behavior, e.g., vocalizing, leaping, running, fighting, and recovery latencies. Ss were 6-wk-old female Swiss Webster mice. The drugs subsequently studied under these conditions (imipramine, methamphetamine, methadone, perphenazine, pentobarbital, ethyl alcohol, and chlordiazepoxide) could be distinguished and classified from the profiles of action obtained. Greatest overall reduction of the distress-evoked behaviors in diminishing order were produced by perphenazine, methadone, ethyl alcohol, and chlordiazepoxide. Methadone most selectively reduced leaping responses; perphenazine most selectively prolonged recovery time latencies. None of the agents reduced fighting at doses that did not also modify the other modes of responding.—*Journal abstract.*

8442. Jaffe, Peter G. & Baum, Morrie. (McGill U., Montreal, Quebec, Canada) **Increased resistance-to-extinction of an avoidance response in rats following the administration of hashish resin.** *Psychopharmacologia*, 1971, Vol. 20(1), 97-102.—Trained 30 experimentally naive hooded rats to avoid shock in an automated apparatus. Ss were then given extinction trials with the shocker disconnected. Ss were divided into 3 groups prior to extinction and given an ip injection of either 1 of 2 doses of hashish resin or the vehicle used to dissolve it. Both doses of hashish resin were found to significantly increase the number of trials required to reach the extinction criterion as compared to the placebo group. The higher of the 2 doses also induced a significant increase in spontaneous recovery responding 1 day later. Results are compared to a similar finding obtained by M. Baum with alcohol. *Journal abstract.*

8443. Jancke, J. B., Jongkees, W., & Oosterveld, W. J. (U. Amsterdam, Netherlands) **Selective suppression of the fast phase of labyrinthine nystagmus by phentanyl (fentanyl).** *Acta Oto-Laryngologica*, 1969(Dec), Vol. 68(6), 468-473.—In an experiment with 20 normal rabbits, it was found that the effects of phentanyl on the otolithic- and cupulo-ocular reflex arch appeared similar, and selectively suppressed the quick phase of nystagmus in Ss. Although it suppressed the formation of nystagmus, the peripheral activity of the cupulae and otoliths remained intact. The action of the drug seems thus to suppress the quick phase centrally. This view demonstrates the necessity of a torsion-swing test also as a check on the caloric test. (German summary) (23 ref.)—*Journal abstract.*

8444. Johnson, David N., Funderburk, William H., & Ward, John W. (A. H. Robins Research Lab., Richmond, Va.) **Effects of fenfluramine on sleep-wakefulness in cats.** *Psychopharmacologia*, 1971, Vol. 20(1), 1-9. **Pre-** cats. *Psychopharmacologia*, 1971, Vol. 20(1), 1-9. Prepared 5 mongrel cats with chronically implanted electrodes for recording sleep-wakefulness patterns. 4 Ss received fenfluramine at each of 3 dose levels and data were recorded for the following 12 hr. Percent of time in paradoxical sleep was significantly reduced by 2.5 and 7.5 mg/kg, but not by .5 mg/kg, of fenfluramine. The

higher doses also increased slow-wave sleep and, at 1.5 mg/kg, an anorectic dose, total sleep time was significantly increased. Under similar conditions amphetamine at an anorectic dose of 1 mg/kg significantly suppressed both paradoxical sleep and slow-wave sleep in 3 Ss. Rebound of paradoxical sleep after suppression induced by 2.5 mg/kg of fenfluramine was not seen in either of 2 Ss studied when sleep patterns were recorded for 48 hr. After 7.5 mg/kg of the drug, however, rebound was seen on Days 1 and 4 after suppression of paradoxical sleep which lasted for over 26 hr. In 2 Ss, daily administration of 2.5 mg/kg of fenfluramine for 16 consecutive days, followed by saline administration for 3 days, indicated that tolerance was developing to the suppression of paradoxical sleep produced by the drug. (18 ref.)—*Journal abstract*

8448 Koffler, Kenneth & Condon, G. E. (Clarke Inst. of Psychiatry, Toronto, Ontario, Canada) Effects of chronic and acute morphine administration on one-way avoidance training. *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 47-48.—Administered ip injections of either 1 mg/kg of morphine sulfate or physiological saline to 42 chronically morphinized or non-morphinized male Wistar rats before training in a 1-way avoidance apparatus. During the acquisition stage the acute administration of morphine increased the number of shocks received by the nonmorphinized Ss but had no effect on the escape latencies of any of the groups. During the criterion run of 10 consecutive avoidances, chronic morphinization decreased avoidance latencies, while acute morphine administration had no effect.—*Journal abstract*

8446 Kvetnansky, Richard; Silberfeld, Sam; Wetse, Virginia K., & Kopin, Irwin J. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) Effects of restraint on rat adrenomedullary response to 2-deoxy-D-glucose. *Psychopharmacologia*, 1971, Vol. 20(1), 22-31.—Compared male Sprague-Dawley rats immobilized for 2 hr daily for 7 or 40 consecutive days to unrestrained controls. Urine samples were collected for 2 consecutive 24-hr intervals starting with the beginning of the last 2-hr restraint interval. 4 days after the last restraint interval, all Ss received a single injection of 2-deoxy-D-glucose (2DG) (500 mg/kg). Immediately afterwards, urine specimens were collected for another 24-hr period. The 24-hr urinary epinephrine (E) of the initial period was markedly increased after 7 and 40 immobilizations. The increase in E was significant during the 2nd day of collection after 7 but not after 40 immobilizations. The urinary E during the period after 2DG administration was increased for all immobilized Ss, the E levels after 40 immobilizations were greater than after 7. For evaluating adrenal changes, Ss were immobilized daily and given 2DG daily. 6 hr after 1 immobilization followed by 2DG there was a marked lowering of adrenal epinephrine and a small increase in adrenal tyrosine hydroxylase (TH) and phenylethanolamine-N-methyl transferase. Those Ss immobilized and treated with 2DG daily for 1 wk. showed marked lowering of adrenal E and an increase in adrenal TH and dopamine-B-hydroxylase.—*Journal abstract*

8447 Marczyński, T. J. (Illinois, Medical Center, Chicago) Cholinergic mechanisms determine the occurrence of reward contingent positive variation (RCPV) in cat. *Brain Research*, 1971, Vol. 28(1), 71-83.—Studied the effects of anticholinergic drugs

(atropine and scopolamine) and a cholinesterase inhibitor (physostigmine) with regard to their action on postreinforcement FFC synchronization and associated epicortical steady potential shift (reward contingent positive variation; RCPV) in cats trained to press a lever for milk reward. Results indicate that there are 2 functionally antagonistic cholinergic synaptic mechanisms in the visual cortex of the cat; 1 responsible for rhythmic phasing of neuronal activity at an average frequency of 7.8 cps during the postreinforcement synchronization, RCPV responses, presumably based on recurrent hyperpolarizing inhibition, and the other responsible for desynchronization of the electrocortogram activity through a blocking action on the synchronizing mechanism. (27 ref.)—*Journal summary*

8448 Mashkovskii, M. D. & Roshchina, L. F. (All-Union Research Chemico-Pharmaceutical Inst., Moscow, USSR) Vliyeniye azapena na bioelektricheskiy aktivnost golovnogo mozga. [Influence of azapen on cerebral bioelectrical activity.] *Farmakologiya i Toksikologiya*, 1971(Mar), Vol. 34(2), 144-148.—Unanesthetized immobilized cats and rabbits were used to study the influence on cerebral bioelectrical activity of azapen [2-(4-methyl-1-piperazinyl)-10-methyl-3,4-diazaphenoxazine dihydrochloride], possessing antidepressive activity and with respect to a number of pharmacological properties close to imipramine and other tricyclic antidepressants. 1-10 mg/kg azapen iv exerted a stimulating influence on the EEG of the cortex, hippocampus, and mesencephalic reticular formation. Azapen brought about (a) activation of the cortical EEG, (b) appearance of hippocampal θ activity, (c) decrease in the thresholds of activation on electrostimulation of the sciatic nerve and the mesencephalic reticular formation, (d) decrease in threshold of hippocampal convulsive activity, and (e) increase in duration of evoked afteraction discharges. Azapen potentiated the activating influence of phenamine (amphetamine) on the EEG, bringing about desynchronization of bioelectrical activity. (English summary) (20 ref.)—*J. D. London*

8449 Matthies, H., Fährke, Christa, & Lietz, W. (Medical Academy, Inst. of Pharmacology & Toxicology, Marburg, W. Germany) Die Wirkung von RNS-Präkursoren auf die Erhaltung des Langzeitgedächtnisses. [Effect of RNA-precursors on the maintenance of long-term memory.] *Psychopharmacologia*, 1971, Vol. 20(1), 10-15.—14 days before and 10 days during the training of optic discrimination, rats received 100 mg/kg orotic acid ip daily. Whereas in control Ss memory retention decreased in the 1st days after training no extinction was seen in the treated Ss over a 200 day period. After that, retention decreased at the same rate as in controls. It is concluded that 2 different stages of long-term memory can be distinguished: the preservation and true extinction. The true extinction seems to have a constant rate of decline. The theoretical interpretation and the importance of the individual slopes of the extinction curves are discussed.

8450 Mori, Kenjiro; Mitani, Hitoshi, & Fujita, Masao. (Tokyo Women's Medical School, Japan) Epileptogenic properties of diethyl ether on the cat central nervous system. *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 345-349.—Studied the reasons for the difference in the degree of neuronal depression in apparently equal depths of anesthesia. 15 experiments were performed with 10 adult cats during

deep anesthesia induced by diethyl ether. It was demonstrated that very deep stage ether induced electrographic seizure activity, which originated in the limbic system and propagated to the neocortex with minimal or no involvement of the midbrain reticular formation. The reticular multiple unit activity was markedly depressed at the preictal period and enhanced only slightly during the seizure, whereas the multiple unit activity at the limbic system and neocortex decreased gradually during the preictal period and increased abruptly and explosively when rhythmical seizure activity occurred in these brain areas. It is suggested that the seizure induced by ether might be due to a combination of excitation of limbic structures and depression of the brainstem controlling system. (French summary)—*Journal summary*.

8451. Novikova, G. V. & Komendantova, M. V. (Moscow Medical Stomatological Inst., USSR) **O deistvii gidroksizina i oksilidina na tsentral'nyu nervnyu sistemu.** [On the action of hydroxyzine and oxyline on the central nervous system.] *Farmakologiya i Toksikologiya*, 1971(Mar), Vol. 34(2), 131-135.—400 white rats and 12 rabbits were used to study the actions on the CNS of hydroxyzine and oxyline (tranquilizers devoid of anticorazol—antimetazol—effect). Elementary emotional behavior was investigated with implantation of electrodes in the lateral and ventromedial hypothalamic nuclei (for elicitation of the reactions of self-stimulation and avoidance, respectively). Defensive CRs were also employed. Bioelectrical recordings of various parts of the brain were made for rabbits. Pain sensitivity was determined by electrical stimulation of the tail for rats. The 2 drugs had effects that were mostly similar. However, in the case of hydroxyzine, self-stimulation was noticeably inhibited; whereas oxyline increased it somewhat. While the effects of the 2 drugs on cerebral bioelectrical activity were in the same direction, differences in the intervals of time for their emergence were noted in various structures of the brain (hippocampus, hypothalamus). (English summary) (15 ref.)—*I. D. London*.

8452. Ortiz, Aurelio; Glover, Alice, & Lang, William J. (San Marcos U., Medical School, Lima, Peru) **The effects of acute and chronic administration of chlorpromazine on the acquisition and extinction of positively reinforced operant responses.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 407-412.—Assigned 40 young albino rats to 1 of 4 groups receiving ip injections of saline or chlorpromazine (CPZ). CPZ depressed the acquisition of positively reinforced conditioned responses, the degree of depression depending on the dose level and task difficulty. High doses blocked the learning process at an early stage, and had a greater depressant effect than did a lower dose at the same stage. Chronic treatment even if discontinued during training decreased performance of a previously learned task and facilitated extinction. Continued chronic treatment decreased motor activity and ability to acquire a discriminative response. It is proposed that CPZ affects learning by depressing motor activity, and by impairing other processes that are involved in the acquisition of CRs. It appears that chronic CPZ has little permanent effect on the ability to learn new tasks, but may affect the retention of previously learned responses. (25 ref.)—*Journal abstract*.

8453. Ott, Tilmann & Matthies, Hansjürgen. (Medical Academy, Inst. of Pharmacology & Toxicology, Magdeburg, W. Germany) **Die Wirkung von Orotsäure**

auf die durch elektrokonvulsiven Schock ausgelöste retrograde Amnesie. [The influence of orotic acid on the retrograde amnesia caused by electroconvulsive shock.] *Psychopharmacologia*, 1971, Vol. 20(1), 16-21.—Investigated the influence of the RNA precursor orotic acid on the retrograde amnesia caused by ECS in rats using an optical discrimination test. ECS, given 2 hr. or less after training, led to significant retrograde amnesia in controls if tested 24 hr. later. The same effect was found in Ss treated with a single dose of 100 mg/kg orotic acid ip, given 10 min. before training. Contrary to these findings, no amnesia could be produced in Ss pretreated with a daily dose of 100 mg/kg orotic acid ip over 4 days. The prolongation of extinction, typical after orotic acid treatment, was also seen in these Ss. An explanation of these findings may be that repeated administration of orotic acid leads to an improved consolidation of memory, possibly via some changes in the central nucleotide and/or RNA metabolism.—*English abstract*.

8454. Panksepp, Jaak. (U. Sussex, Lab. of Experimental Psychology, England) **Drugs and stimulus-bound attack.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 317-320.—Studied the effects of chlordiazepoxide and methamphetamine on stimulus-bound attack in 28 albino rats. Chlordiazepoxide essentially abolished stimulus-bound affective attack while decreasing the threshold of quiet-biting attack. Methamphetamine accentuated affective attack and increased the threshold of quiet-biting. Generally, the drug effects on stimulus-bound affective attack simulated changes that occur during reflexive-fighting, and the drug effects on quiet-biting attack tended to simulate effects found with spontaneous mouse-killing.—*Journal abstract*.

8455. Rajecki, D. W. & Saegert, Susan. (U. Michigan) **Effects of methamphetamine hydrochloride on imprinting in White Leghorn chicks.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 7-8.—Reports that the state of arousal in young precocial birds is a determinant of the strength of the social bond formed during an imprinting opportunity. Imprinting is inhibited in Ss under the influence of sodium pentobarbital, a tranquilizer. Conversely, Ss aroused through exposure to additional external stimulation or the influence of the stimulant racemic amphetamine sulfate show enhanced social responses. In an experiment with 24 white Leghorn chicks using methamphetamine hydrochloride as a stimulant, it was found that, relative to saline controls, Ss under the influence of the excitant yielded reliably stronger indices of imprinting. *Journal abstract*.

8456. Randt, Clark T., Quartermain, David; Goldstein, Menek, & Anagnoste, Berta. (New York U., Medical School) **Norepinephrine biosynthesis inhibition: Effects on memory in mice.** *Science*, 1971(Apr), Vol. 172(3982), 498-499.—Diethylthiocarbamate, a dopamine beta hydroxylase inhibitor, decreases biosynthesis of norepinephrine in the brain. The effects of this inhibitor coincide with alterations in memory as this inhibitor was demonstrated in single-trial passive avoidance in 40 adult male C57BL/6J mice. *Journal abstract*.

8457. Russell, Roger W., Vasquez, Beatriz J., Overstreet, David H., & Dalglisch, Frank W. (U. California, Irvine) **Effects of cholinolytic agents on behavior following development of tolerance to low cholinesterase activity.** *Psychopharmacologia*, 1971, Vol. 20(1), 32-41.—The development of tolerance during

periods of chronically low levels of cholinesterase (ChE) induced by administration of diisopropyl fluorophosphate (DFP) is evidenced in systematic changes in behavioral variables. The present experiment studied the biochemical mechanisms involved by challenging tolerant and control Ss (22 naive male Sprague-Dawley rats) with pharmacological agents known to affect the cholinergic system: the cholinolytics, atropine, and methylatropine. Measures of the free operant behavior showed tolerance to have developed by the 9th injection of DFP, after which the challenge series began. Clear differences were apparent between the effects of the cholinolytic agents on the tolerant and control groups. Dose-response curves for both groups showed similar trends of decreasing performance with increasing dose level until a critical point was reached. With further increases in dose, there was a complete absence of responding in the majority of tolerant Ss, while controls continued to perform at about 40% normal. The fact that effects of the methylatropine challenge were not significantly different in tolerant and control Ss implies that the biochemical processes of tolerance had a major central component. (24 ref.)—*Journal abstract*.

8458. Sanghvi, Indravadan; Urquiga, Xavier, & Gershon, Samuel. (New York U., Medical Center) Exploration of the anti-depressant potential of L-dopa. *Psychopharmacologia*, 1971, Vol. 20(2), 118-127. Investigated the potential usefulness of L-dopa as an antidepressant with mongrel dogs. It was hypothesized that a potential antidepressant should potentiate the behavioral and cardiovascular effects of yohimbine, a naturally occurring indole alkaloid. The interactions of L-dopa with antagonists and drugs that potentiate its effects were also investigated. Ss were prepared by placing an indwelling cannula in the femoral artery for recording arterial pressure. Results indicate that L-dopa (30 mg/kg) produced sedative effects, whereas yohimbine produced stimulatory effects. L-dopa failed to potentiate yohimbine effects. Ro-4-4602 (50 mg/kg), a decarboxylase inhibitor, markedly inhibited the effects of L-dopa. Haloperidol (.1-2 mg/kg), a dopamine antagonist, completely prevented the behavioral and cardiovascular effects of L-dopa. Following imipramine (1.5 mg/kg) pretreatment, L-dopa failed to produce any behavioral effects. However, imipramine, when administered 10-15 min. after L-dopa, markedly increased behavioral effects but reduced the cardiovascular and emetic effects. Results are consistent with the literature, finding L-dopa not to be an antidepressant in man, but inducing, rather, motor mobilization. (30 ref.)—*Journal abstract*.

8459. Schoenfeld, R. I. (Harvard Medical School, Boston, Mass.) Melatonin: Effect on punished and nonpunished operant behavior of the pigeon. *Science*, 1971(Mar), Vol. 171(3977), 1258-1260. Injections of melatonin in 8 adult male White Carneaux pigeons had a dose-dependent, rate-increasing effect on responding maintained by a fixed-interval schedule of positive reinforcement. When a punishment contingency was added to the fixed-interval schedule, the overall rates were not increased although responding was increased during the initial part of each interval. (16 ref.)—*Journal abstract*.

8460. Schrold, J. & Squires, R. F. (A S Ferrosan, Research Lab., Soeborg, Denmark) Behavioural effects of d-amphetamine in young chicks treated with p-Cl-phenylalanine. *Psychopharmacologia*, 1971, Vol.

20(1), 85-90. d-Amphetamine administered to 5-day-old White Leghorn cockerels provoked wing droop, postural changes and twittering. p-Cl-phenylalanine methyl ester (H 69/17) which lowered the content of 5-hydroxytryptamine (serotonin) (5-HT) and 5-hydroxy-3-indoleacetic acid in the brain to about 30% of control values in chicks of the same age, induced no marked behavioral changes. Pretreatment with H 69/17 protected against the above mentioned effects of d-amphetamine. Simultaneously d-amphetamine induced marked excitation with aggressive behavioral components. It is concluded (a) that the predominant actions of d-amphetamine in newly hatched chicks are mediated via a serotonergic (tryptaminergic) mechanism, which masks the excitatory effects of the drug in this animal species; and (b) that there are great similarities between the behavioral changes seen after d-amphetamine in 5-HT depleted chicks and imipramine in normal chicks. (21 ref.)—*Journal abstract*.

8461. Seiden, Lewis S. & Martin, Teackle W. (U. Chicago) Potentiation of effects of L-dopa on conditioned avoidance behavior by inhibition of extracerebral dopa decarboxylase. *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 453-458.—Found that it is possible to completely inhibit extracerebral dopa decarboxylase without inhibiting or only partially inhibiting cerebral decarboxylase by using suitable doses (25-50 mg/kg) of the compound, Ro-4-4602 (N-(diisopropyl-N-(2,3,4-trihydroxybenzyl)hydrazine). Male DBA-1 mice and Sprague-Dawley rats were trained to perform a conditioned avoidance response (CAR), and treated with reserpine, followed by Ro-4-4602, and then L-dopa; control Ss were treated with identical doses of reserpine and L-dopa but saline instead of Ro-4-4602. L-dopa reversed a reserpine-induced suppression of the CAR, and this reversal was potentiated by Ro-4-4602. Ro-4-4602 caused blockade of sympathomimetic effects of L-dopa. Catecholamine assay in groups receiving parallel treatment revealed that no dopamine was synthesized in heart from L-dopa in mice pretreated with Ro-4-4602 but that there was a rise in brain levels of dopamine. Results indicate that extracerebral conversion of dopa to dopamine is not essential to the reversal of a reserpine-induced suppression of a CAR. (17 ref.)

—*Journal abstract*

8462. Sherwin, Ira. (Harvard Medical School, Boston, Mass.) Differential action of diazepam on evoked cerebral responses. *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 445-452.—Studied evoked cerebral responses in 16 unanesthetized immobilized cats after iv administration of diazepam in divided doses. It was found that those sensory and motor responses which depend upon polysynaptic mechanisms were most sensitive to the depressant effects of diazepam. Species-specific differences in the effects of diazepam on cat, man, and the light-sensitive baboon (*Papio papio*) are discussed. It is concluded that the depressant effects of diazepam are exerted primarily on interneurons. It is suggested that this action may account for the observed beneficial effects in myoclonic disorders. (French summary) (27 ref.)—*Journal summary*.

8463. Stein, Larry & Wise, C. David. (Wyeth Lab., Philadelphia, Pa.) Possible etiology of schizophrenic progressive damage to the noradrenergic reward system by 6-hydroxydopamine. *Science*, 1971(Mar), Vol. 171(3975), 1032-1036.—Reports that single or repeated intraventricular injections of 6-hydroxydopamine

caused marked and long-lasting deficits in brain self-stimulation and other rewarded behaviors in the rat. The behavioral deficits, and the depletion of brain norepinephrine induced by 6-hydroxydopamine, were prevented by prior treatment with chlorpromazine. Episodic or continuous formation of endogenous 6-hydroxydopamine in man as a result of a genetically determined enzymatic error could selectively damage the binding capacity and, eventually, the structural integrity of the noradrenergic reward mechanism. Such damage might cause the fundamental symptoms and long-term downhill course of schizophrenia. (38 ref.)—*Journal abstract*.

8464. Sutton, Dwight & Burns, Jerry. (Arizona State U.) **Alcohol dose effects of feedback-maintained simple reaction time.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 151-159.—2 dose levels of alcohol were given to 10 adult volunteers (age range, 23-40 yr.) performing finger extension and finger flexion in an RT paradigm. 2 stimulus modes—visual and auditory—were investigated. RTs were briefer to auditory than to visual stimuli. Flexion and extension responses were approximately equal in RT latency. Alcohol impaired females in their performance of each response but did not affect males significantly. Ss with normally faster RTs were less affected by alcohol than were those with normally slower RTs.—*Author abstract*.

8465. Tewari, S. & Noble, E. P. (U. California, Irvine) **Ethanol and brain protein synthesis.** *Brain Research*, 1971, Vol. 26(2), 469-474.—Determined changes in the cerebral protein synthesizing system of mice chronically exposed to ethanol. Ss were 24 C57BL/6J male mice who received a 10% ethanol-water solution and 24 matched controls who received just water as their sole drinking fluid. It was found that "chronic ethanol imbibition of 10 days or longer duration exerts multiple effects on the protein synthesizing system of mouse brains." A rise in brain ribosomes was observed in Ss. These were functionally less active than those from controls, suggesting that "either fewer polysomes are present or that there are structural and/or functional aberrations in these polysomal units." Speculation on chronic alcohol usage in humans is made. (20 ref.)—P. Hertzberg.

8466. Valzelli, L. & Bernasconi, S. (Mario Negri Inst. of Pharmacological Research, Milan, Italy) **Differential activity of some psychotropic drugs as a function of emotional level in animals.** *Psychopharmacologia*, 1971, Vol. 20(1), 91-96.—Tested the activity of various psychotropic drugs on the abnormal behavior induced by prolonged isolation in both male Swiss albino mice and Wistar male rats. It is suggested that the different effects shown by the drugs on the various behavioral profiles of the 2 species considered are dependent on the emotional level of the experimental Ss. (29 ref.)—*Journal abstract*.

8467. VanGilder, John C. & O'Leary, James L. (Washington U., Medical School) **Effect of nembutal anesthesia upon Purkinje cell activation in the cat.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 173-188.—Recorded cerebellar evoked phenomena from 86 cats, comparing successively field potential and Purkinje cell (P cell) unit responses under local procaine block in the flaxedilized S and nembutal anesthesia. The configurations and latencies of the field potentials which followed stimulation of the folial surface and olivary and pontine afferent sources were not altered by the induction of nembutal, but unit P

cell responses were significantly changed. With extracellular microelectrodes, a clearly discernible depletion in spontaneous unit activity occurred during the transition to nembutalized state. With this depletion a change in P cell unit response to stimulation occurred. Before nembutal, surface folial stimulation may be followed by up to 14 unit spikes during the negative phase of the surface-evoked potential; after nembutal, by a maximum of only 2 such spikes. The olivocerebellar response changed from a single unit spike in the prenembutal record to the classical repetitive spike pattern in the nembutalized S. (French summary) (39 ref.)—*Journal summary*.

8468. Walsh, J. Michael & Guralnick, Michael J. (American U.) **The effects of epinephrine and chlorpromazine on visual cliff behavior in hooded and albino rats.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 1-3.—Tested 36 Long-Evans hooded and 36 Sprague-Dawley albino infant rats on the visual cliff. Ss were then observed for a 5-min period after receiving injections of epinephrine, chlorpromazine, or a placebo. Hooded Ss (a) chose the shallow side of the visual cliff more often; (b) spent more time on that side; and (c) were more emotional, as measured by fecal bolus counts. Albinos explored more, as indicated by their higher activity and crossover scores. Epinephrine tended to increase the emotionality of the albinos and markedly facilitated the response of avoiding the deep side of the visual cliff. Strain differences evident in visual cliff behavior are discussed in terms of differences in emotionality rather than ability to perceive depth. (22 ref.)—*Journal abstract*.

8469. Walter, S., Balzano, E., Vuillon-Cacciuto, G., & Naquet, R. (Lab. of Surgical Neurophysiology, Unit 41, Suresnes, France) **Effets comportementaux et électrographiques du diéthylamide de l'acide D-lysergique (LSD 25) sur le Papio papio photosensible.** [Behavioral and electrographic effects of D-lysergic acid diethylamide (LSD 25) on the photo-sensitive Papio papio.] *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 294-305. Studied the behavior, spontaneous electrographic activities, visual evoked potentials, and photosensitivity of 15 baboons (Papio papio) before and after iv administration of LSD 25. The changes in these parameters were noted and possible relationships between them investigated. There was a strict correlation between the disturbances of behavior (refusal of food), the disappearance of the visual evoked potential in the lateral geniculate body and the occipital cortex, the increase in the late wave of the occipital evoked potential, and the blocking of the irradiated frontorolandic response. It is concluded that the photosensitivity of Papio papio seems to require the integrity of the occipital evoked potential (primarily of the early wave, secondarily of the late wave) and the arrival of impulses in the frontorolandic region. (French summary) (46 ref.)—*English summary*.

8470. Wikler, Abraham; Pescor, Frank T., Miller, Dianne, & Norrell, Horace. (U. Kentucky, Coll. of Medicine) **Persistent potency of a secondary (conditioned) reinforcer following withdrawal of morphine from physically dependent rats.** *Psychopharmacologia*, 1971, Vol. 20(2), 103-117.—On 9 nights (8 PM to 8 AM) over a 25-day period, an anise-flavored aqueous solution of etonitazene, 5 mcg/ml, was provided as the sole drinking fluid for 12 male Wistar physically

dependent rats (MIEITZ) maintained on morphine 200 mg/kg up once daily at 8 AM (once actively abstinent each night) and for 12 saline-injected Ss. Only amine-flavored water was available in 12 comparable physically dependent and 12 saline-injected Ss. Beginning 3 days after abrupt and permanent termination of morphine or saline injections, all Ss were tested at intervals over a 287 day period on nocturnal choice drinking from 2 tubes (positions alternated). 1 contained amine-flavored water and the other, plain water. Analyses of variance on the mean volumes of each of the 2 fluids consumed by each S over blocks of choice-drinking tests reveal that through the 8th test (13th post-injection day), MIEITZ drank more amine-flavored water than any other group while there were no significant differences among the groups as regards consumption of plain water. Evidence indicates that the potency of secondary reinforcers so generated can persist long after morphine withdrawal. Implications for problems of relapse and treatment of opioid addicts are discussed. (11 ref.)—*Journal abstract*

8471 Woods, Donald J. & Routtenberg, Arvid. (Northwestern U.) "Self-starvation" in activity wheels: Developmental and chlorpromazine interactions. *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 84-93.—Conducted 4 experiments with a total of 30 30-45 and 22 70-90 day old male albino Sprague-Dawley rats. Adult Ss on a food-deprivation schedule showed increased running in activity wheels and a paradoxical depression of food intake. This "self-starvation" effect was markedly potentiated in younger Ss which, relative to controls, ran more and sustained greater weight loss than did older Ss. Chlorpromazine (a) reversed the self-starvation syndrome by depressing the activity and alleviating weight loss of the older Ss, and (b) exacerbated self-starvation with younger Ss. It is concluded that 30-45 day old Ss reacted to 23-hr deprivation with a severe stress response, perhaps related to the failure of incompletely developed neural and endocrine mechanisms to modulate the reaction to the self-starvation situation. (19 ref.)—*Journal abstract*

8472 Zakuon, V. V. & Ostrovskaya, R. U. (Inst. of Pharmacology, Moscow, USSR) Povyshenie ustoiichivnosti myshel k gipoksii pod vliyaniem trankvillizatorov benzodiazepinovogo ryada. [Increase in the resistance of mice to hypoxia under the influence of tranquilizers of the benzodiazepine series.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1971(Jeb), Vol. 71(2), 45-47.—Presents the results of a study on the influence of diazepam (seduxen), chloridazepoxide (telenium), and nitrazepam (mogadon) upon the survival time of white mice placed in a hermetic chamber with reduced O₂ content (8.7 volumetric %). Not less than 16 Ss were used in each experimental series. For comparative purposes meprobamate (a propandiol derivative) and the neuroleptic aminazine (chlorpromazine), were utilized. Drugs of the benzodiazepine series increased survival time, the most effective being diazepam. The protective effect of this preparation was retained for over 4-5 hr and enjoys a wide therapeutic range. It is suggested that diazepam may find some application in clinical practice when hypoxic states are involved. Meprobamate and aminazine displayed no clear protective action in hypoxia. (English summary) (18 ref.)—*J. D. London*

8473 Zavalich, Walter S. (Florida State U.) Gustatory nerve discharge and preference behavior of penicillamine treated rats. *Physiology & Behavior*,

1971(Apr), Vol. 6(4), 419-423.—Tested the hypothesis that penicillamine (D-Pen) induces hypogeusia, an impairment in gustation, by causing peripheral changes. 28 male Sprague-Dawley rats were tested both behaviorally and electrophysiologically over a wide range of NaCl concentrations. Ss were also tested with other solutions of various taste qualities for any other exaggerated preference. Large preferences for high concentrations of sodium saccharin, NH₄Cl, KCl, and NaCl solutions were found to exist in Ss treated with D-Pen. The electrophysiological behavioral, and exaggerated nerve activity responses were similar for control and D-Pen groups. It is concluded that D-Pen, despite producing marked preference shifts, does not alter the sensitivity of the taste bud to taste stimuli.—*Journal abstract*

CARDIOVASCULAR PROCESSES

8476. Pastukhov, V. A. (Pavlov Inst. of Physiology, Leningrad, USSR) Krovosnabzhenie kory golovnogo mozga v norme i pri éksperimental'nom neuroze. [Blood supply of the cerebral cortex in the normal state and in experimental neurosis.] *Zhurnal Vyssheï Nervnoi Deiatel'nosti*, 1970(Sept), Vol. 20(5), 1064-1069.—3 dogs were used to study the changes in blood supply of the temporal cortical structures in response to various stimuli in the normal state and in experimental neurosis. Thermistors were implanted in Zones T₁ and T₂ of the auditory cortex. A tone (1500-2200 cps, 60 db.) increased the blood supply in this area, but rhythmic light (5 and 20 sec) after extinction of the orienting reflex, left it unchanged. After a number of combinations (85-120) of rhythmic light (20 sec) and the tone, light began to evoke the same changes as the tone did. It was possible to extinguish this reaction and to restore it. Rhythmic light at 5 sec served as differentiation. A conflict was then produced over a 4-day period, involving the positive and differential conditioned signals in combination with electroshock, leading to experimental neurosis expressed in (a) lengthening of latent periods and of the duration of changes in blood supply of the temporal cortex in response to both conditioned and unconditioned signals, (b) disinhibition of differentiation, and (c) wavelike changes in blood supply. Experimental neurosis lasted 1.5-2 mo. Changes in blood supply of the auditory cortex were shown to have a functional character and disappeared after the S's emergence from experimental neurosis without any therapy whatever. (English summary) (41 ref.)—*J. D. London*

8477 Prestrude, A. M. & Crawford, F. T. (Virginia Polytechnic Inst.) Tonic immobility in the lizard, *Iguana iguana*. *Animal Behaviour*, 1970(May), Vol. 18(2), 391-395.—Results from 8 male iguanas indicate that the tonic immobility response can be induced in the iguana by a combination of inversion, restraint, and moderate pressure. During immobility there was a systematic decline in respiration rate, the rhythm became

sporadic, and the magnitude irregular. Prolonged immobility did not seem to be consonant with a fear hypothesis, but could be the result of a period of cortical depression due to increased brainstem activity. (18 ref.)—*M. Strobel*

8478. Weisbard, Charles & Graham, Frances K. (U. Wisconsin) **Heart-rate change as a component of the orienting response in monkeys.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 74-83.—Reports that direction of the heart-rate (HR) response appears to distinguish, in many species, between a generalized orienting response accompanied by HR deceleration and a generalized defensive reflex accompanied by HR acceleration. 3 experiments with a total of 7 male and 11 female stump-tailed monkeys were conducted. HR was studied under conditions permitting the 2 reflexes to be distinguished. Deceleration was obtained when conditions were appropriate for eliciting orienting, i.e., when novel nonstartling moderately intense stimuli were presented to awake Ss. Acceleration was obtained when stimuli were intense.—*Journal abstract.*

ENVIRONMENT & STRESS

8479. Badia, Pietro; Culbertson, Stuart; Defran, R. H., & Lewis, Paul. (Bowling Green State U.) **Attenuation of rat vocalizations to shock by a stimulus: Sensory interaction effects?** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 131-136.—Studied the attenuation of distress vocalizations to shock by a stimulus preceding shock in 6 experiments with 48 Holtzman albino and 24 hooded female rats. Attenuation remained constant within and across 4 experimental sessions and occurred on the 1st trial. Significantly fewer vocalizations occurred when shock was preceded by onset of a visual stimulus with either a 3- or 6-sec trace or delay interval. Inhibition of vocalizations did not occur (a) when onset of both stimulus and shock was simultaneous, (b) when the stimulus was offset of stimulation, or (c) when stimulus was in the same sensory modality (tactual) as shock. A nonassociative interpretation emphasizing sensory interaction is supported.—*Journal abstract.*

8480. Bergström, Bengt & Arnberg, Peter. (Inst. of Military Psychology, Stockholm, Sweden) **The effect of threat- and task-oriented attitude upon performance under stress.** *Scandinavian Journal of Psychology*, 1971, Vol. 12(1), 14-20.—Studied tracking performance and arousal level in 30 army conscripts who were threatened with electric shocks. It was hypothesized that Ss with experimentally induced threat-oriented (despair) attitudes would degrade performance as a function of arousal, and that Ss with task-oriented (confidence) attitudes would retain normal performance under high arousal. Results show that performance deteriorated more under conditions of despair, but that the arousal-performance relation conformed to the activation theory in both conditions.—*Journal abstract.*

8481. Bevan, J. (Royal Naval Physiological Lab., Gosport, England) **The human auditory evoked response and contingent negative variation in hyperbaric air.** *Electroencephalography & Clinical Neurophysiology*, 1971(Mar), Vol. 30(3), 198-204.—Recorded the auditory evoked response (AER) and contingent negative variation (CNV) from 13 experienced male divers, before, during, and following an exposure to an increased ambient air pressure simulating a depth in sea

water of 300 ft. Results indicate that the AER was significantly affected at depth, while the CNV showed no significant changes. Results suggest that the AER and CNV are generated by independent mechanisms. The AER is considered to be attenuated by inhibition exerted during its propagation and passage through the ascending reticular activating system (ARAS). The CNV is considered to be a self-propagating phenomenon, initiated by the interaction between the specific, non-specific, and associational thalamic nuclei and, as such, to be at least partly independent of the changes assumed to occur in the activity of the ARAS. (French summary) (24 ref.)—*Journal summary.*

8482. Cabanac, M., Cunningham, D. J., & Stolwijk, J. A. (U. Claude Bernard, U.E.R. Médicale Lyon Sud-Ouest, Oullins, France) **Thermoregulatory set point during exercise: A behavioral approach.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 94-102.—Examined the finding that response to a peripheral thermal stimulus is an indicator of thermal status with respect to the thermoregulatory set point. 6 men and 3 women were provided with a glove perfused with water, adjustable in temperature from 15-45°C. Ss were asked to maintain the glove temperature at the level they considered most pleasant. In response to environmental temperatures ranging 15-45°C and to exercise at levels of 500 and 1,000 kgm/min, the selected glove temperature ranged 20-40°C. The preferred glove temperature (a) depended strongly on internal body temperature, (b) was affected to a lesser extent by mean skin temperature, and (c) was not affected by exercise alone. Results suggest there is no change in thermoregulatory set point during exercise. (27 ref.)—*Journal abstract.*

8483. Engel, J., Hanson, L. C., & Roos, B. E. (U. Göteborg, Sweden) **Effect of electroshock on 5-HT metabolism in rat brain.** *Psychopharmacologia*, 1971, Vol. 20(2), 197-200.—Administered repeated electroshock treatment (EST) on 3 consecutive days to 72 male Sprague-Dawley rats. The last treatment was given immediately after an injection of a tryptophan-hydroxylase inhibitor, H 22/54. Ss were killed 3 hr. later. 24 brainstems were pooled, analyzed for 5-hydroxytryptamine (5-HT) and 5-hydroxyindoleacetic acid (5-HIAA), and the values compared with a group of Ss receiving H 22/54 only. A significant decrease in 5-HT was seen in the EST group indicating an increase in the release of 5-HT after the repeated treatment. When the level of 5-HIAA in the EST group was compared with the level in the group treated with H 22/54 alone, the difference was slight. The small increase could be explained by the rather slow turnover rate of 5-HT in the CNS and thus of the synthesis of 5-HIAA. The possibility of an accelerated outflow of 5-HIAA from the CNS after EST should also be considered.—*Journal abstract.*

8484. Fishbein, William. (City Coll., City U. New York) **Disruptive effects of rapid eye movement sleep deprivation on long-term memory.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 279-282.—Examined the hypothesis that REM sleep deprivation will produce impairment of long-term memory. 64 hybrid mice deprived of REM sleep for 3, 5, or 7 continuous days, during the interval between a 1-trial inhibitory avoidance training experience and a subsequent retention test, displayed a temporary retrograde amnesia when tested 30 min. or 3 hr. following termination of REM deprivation. Ss did not recover from the amnesia if ECS was administered immediately following REM sleep

deprivation. In a further study, the generality of these findings was obtained by depriving 64 Swiss Webster mice of REM sleep during the interval between a discrimination training experiment in a black-white T-maze and the subsequent retention test. (29 ref.)—*Journal abstract.*

8485. Grosser, George S. & Percy, Hector E. (American International Coll.) **Postshock immersion of mice without memory disruption.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 119-122.—Immersed 36 male Swiss Webster mice in hot or cold water, or sawdust, immediately following a single trial on a passive-avoidance step-through task. In contradiction to the findings of B. Jacobs and C. Sorenson (see PA, Vol. 43:12587), retention was not significantly impaired. In Exp. II with 36 Ss, the manner in which the Ss were positioned on the apparatus was shown to be a determinant of the step-through latency. It is concluded that Jacobs and Sorenson have not provided enough evidence to support their contention that strong aversive stimulation which is insufficient to evoke convulsions will lead to memory disruption.—*Journal abstract.*

8486. Hamby, Wiley & Cahoon, D. D. (Auburn U.) **The effect of water deprivation upon shock elicited aggression in the white rat.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 52.—Recorded aggressive responses for 10 male naive Sprague-Dawley albino rats under conditions of (a) shock stimulation only, and (b) water deprivation plus shock. Results indicate that shock delivered while the S was water deprived elicited fewer aggressive responses than shock alone and that merely restraining the S did not elicit aggressive responses.—*Journal abstract.*

8487. Hokanson, Jack E., DeGood, Douglas E., Forrest, Marvin S., & Brittain, Thomas M. (Florida State U.) **Availability of avoidance behaviors in modulating vascular-stress responses.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 60-68.—Conducted 2 experiments with 24 and 30 male undergraduates to evaluate the arousal-reducing function of several cognitive factors in stressful situations. In Exp. I, Ss underwent an aversive 1/2-hr shock-avoidance procedure, in which the experimental Ss had optional control over rest periods, and a group of yoked controls had comparable rest periods imposed on them. The experimental group manifested substantially reduced systolic blood pressure levels relative to their yoked counterparts. Results suggest that the availability of an avoidance response had an arousal-reducing effect. In Exp. II, the rest periods were preceded by a reliable signal. Results indicate that anticipatory systolic reductions occurred in conjunction with the pretest signal and that these reductions varied as a function of the length of the subsequent rest period. (21 ref.)—*Journal abstract.*

8488. Korbel, Susan F., Johnson, Kenneth D., & Rowland, Paul S. (U. Arkansas) **Aftereffects of low intensity UHF radiation.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 50-51.—Examined behavioral aftereffects of UHF radiation in 30 male naive Sprague-Dawley albino rats. 15 Ss were exposed to UHF of low frequency (500 mHz.) and low intensity (.43-.15 milliwatts) for 38 consecutive days. For Days 39-55, UHF was not presented to experimental Ss. UHF Ss were less active than non-UHF Ss and continued to be less active for a short period of time after UHF termination.—*Journal abstract.*

8489. Luk'yanov, A. N. & Frolov, M. V. **Ispol'zovanie fiziologicheskikh signalov dlya otsenki emocional'nogo napryazheniya operatora.** [The use of physiological signals for evaluating the emotional tension of the operator.] In A. N. Luk'yanov & M. V. Frolov. "Signalny sostoyaniya cheloveka-operatora." (See PA, Vol. 44:11853).—Discusses (a) the EEG and emotional tension, (b) the analysis of output signals of the ECG integrator, and (c) the average number of intersections per unit time at the null level. Also included is a discussion of the transmissive characteristics of the link "breathing—vagus inhibition." Problems in the spectral analysis of speech signals, and application of spectral evaluation of the intonational characteristics of speech are considered.—*J. D. Levine.*

8490. Miller, Ralph R. & Springer, Alan D. (Brooklyn Coll., City U. New York) **Temporal course of amnesia in rats after electroconvulsive shock.** *Psychology of Behavior*, 1971(Mar), Vol. 6(3), 229-233.—Administered a single ECS to 34 albino male Sprague-Dawley rats immediately following 1-trial passive avoidance training in a step-through apparatus. Test trials 15, 30, 60, or 120 min. later found retention at 15 min. only. A 2nd experiment with 40 Ss replicated the 15-min retention effect and included a control group that indicated the phenomenon was not a systemic effect caused by the interaction of footshock and ECS. Other groups demonstrated that retention at 15 min., although appreciable, is not complete. Some implications for memory models are discussed. (21 ref.)—*Journal abstract.*

8491. Stern, Warren C. (Worcester Foundation for Experimental Biology, Shrewsbury, Mass.) **Effects of desynchronized sleep deprivation upon startle response habituation in the rat.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 31-32.—Assigned 56 naive male Sprague-Dawley rats to 1 of 4 treatments: (a) desynchronized (D) sleep deprivation, (b) desynchronized sleep deprivation and sleep recovery, (c) cold water immersion stress, and (d) normal conditions. Ss deprived of D sleep had faster habituation rates of click-induced startle responses than did normals, but the same habituation rates as stress controls. It is concluded that the faster habituation in the D sleep deprived group was probably not due to D sleep loss per se, but rather to the accompanying stress and/or increased activity levels.—*Journal abstract.*

GENETICS

8492. Broadhurst, P. L. (U. Birmingham, England) **New lights on behavioural inheritance.** *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 1-8.—The growing acceptance of the importance of hereditary influences in determining individual differences in behavior is observed. The contribution of psychogenetics is discussed. Also discussed are several experiments using cross-bred rats.—*V. S. Sexton.*

8493. Burt, Cyril. **Heredity and environment.** *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 9-15.—The essential research techniques and requisite calculations for heredity-environment studies are explained in terms of their historical development. How they may be applied to some of the most recently available data is illustrated briefly. (22 ref.)—*V. S. Sexton.*

8494. Gwadz, Robert W. (U. Notre Dame) **Monofactorial inheritance of early sexual receptivity in the**

mosquito, *Aedes atropalpus*. *Animal Behaviour*, 1970(May), Vol. 18(2), 358-361.—The autogenous strain shows an early onset of receptivity with a mean insemination time of 38 hr. The anautogenous strain shows a prolonged refractory period with a mean insemination time of 120 hr. Analyses of hybrids and backcrosses indicate that early receptivity is under the control of a single, autosomal, semidominant gene. The sexual behavior seems to differ as a result of differential rates of hormone production by the corpora allata. The autogenous strain, with a more rapid rate of hormone production and a consequently high juvenile hormone titer soon after emergence, becomes receptive early. The anautogenous strain with a slower rate of hormone production becomes receptive late. Hybrids are intermediate but more closely resemble the autogenous line. Application of a juvenile hormone analogue to the anautogenous strain, homozygous for late receptivity, produced sexually precocious females.—*M. Strobel*.

8495. Levine, Ralph L. (Michigan State U.) **Selective breeding for principal components and factors based upon behavioral traits.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 127-130.—Principal components or rotations of principal components are special cases of linear composites. As such a principal component can function as a selection index in breeding experiments, where, instead of selecting for 1 behavioral trait, selection is carried out on an index formed from 2 or more phenotypic characteristics. If the same weights are used in all generations and breeding lines, and if all groups and variables are standardized relative to the foundation stock, then the distributional parameters of the component scores will change, provided, of course, that heritability is sufficiently high. Similar methods can be used to select for more than 1 principal component at a time.—*Journal abstract*.

8496. Lindzey, Gardner; Loehlin, John; Manosevitz, Martin, & Thiessen, Delbert. (U. Texas) **Behavioral genetics.** *Annual Review of Psychology*, 1971, Vol. 22, 39-44.—Reviews major areas of research in the past 5 yr. involving (a) pathways of gene expression; (b) sensory and cognitive abilities and learning; (c) personality and temperament, and social behavior; (d) evolution; and (e) research methodology. A trend toward behavioral genetics as an interdisciplinary field of general interest and significance is noted. Research is seen as significantly broadened by extending from the molecular to the societal. (439 ref.)—*P. Hertzberg*.

PERSONALITY CORRELATES

8497. Underwood, Carol S. (Temple U.) **The relationship between body type and body fat and personality factors of college women.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5881-5882.

8498. Webb, Wilse B. & Friel, Janette. (U. Florida) **Sleep stage and personality characteristics of "natural" long and short sleepers.** *Science*, 1971(feb), Vol. 171(3971), 587-588.—Describes an experiment with 22 undergraduates who typically slept 5½ hr. or less each night and 32 Ss who typically slept 9½ hr. or more. Results indicate that Ss did not differ significantly on a battery of personality, scholastic, and medical measures (the MMPI, CPI, Cornell Medical Index, and the Zung Measurement of Depression Scale). Compared with controls not selected on a sleep length criterion, EEG

recordings of the short sleepers contained reduced amounts of Stage 2 and REM sleep. *Journal abstract*

NUTRITION & GASTROINTESTINAL PROCESSES

8499. Adlard, P. F. & Dobbing, John. (U. Manchester, England) **Vulnerability of developing brain: III. Development of four enzymes in the brains of normal and undernourished rats.** *Brain Research*, 1971, Vol. 28(1), 97-107.—The developmental profiles of 4 enzymes representative of different metabolic pathways or subcellular organelles were determined in the homogenates of whole brains of 0-21 day old control and undernourished male rats. Underfeeding the dams during gestation and lactation resulted in a 66% deficit in body weight of the young, compared with controls at 21 days. The activity deficits at 21 days were, respectively, 21, 14, and 11% for succinate dehydrogenase, fructose diphosphate aldolase, and acetylcholinesterase compared with a deficit in brain weight of 27%. β -N-acetylglucosaminidase was unaffected by undernutrition. Results indicate that the control of enzyme maturation in the brain may have both chronological and developmental components. (33 ref.)—*Journal summary*.

8500. Chow, Bacon F., Simonson, Maria; Hanson, Harley M., & Roeder, Loly M. (Johns Hopkins U.) **Behavioral measurements in nutritional studies.** *Conditional Reflex*, 1971(Jan), Vol. 6(1), 36-40.—Studies on the effects of dietary deficiencies have shown marked behavioral impairments in rats deprived of adequate quantities of specific vitamins. Recently, experiments have demonstrated that restriction of maternal dietary intake during gestation and lactation results in a variety of physiological and behavioral abnormalities in the progeny. These offspring are stunted, retarded in neuromotor development, impaired in maze learning ability, slow to extinguish a CR, and show a low level of exploratory activity, a high degree of emotional behavior and marked antisocial interaction. Patterns of change with increasing age in some of these measurements also distinguish these experimental animals from controls born of adequately fed dams. *Journal summary*.

8501. Ruckebusch, Yves; Grivel, Marie L., & Fargues, Marie J. (National Veterinary School, Lab. of Physiology, Toulouse, France) **Activité électrique de l'intestin et prise de nourriture conditionnelle chez le lapin.** [Electrical activity of the intestine and feeding associated with a visual conditioning in the rabbit.] *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 359-365.—Trained rabbits by conditioning procedures to associate feeding with a visual display of black and white horizontally placed stripes. The degree of movement of the various regions of the alimentary canal was made by recording the electrical activity of the gut. The intermittent activity of the pylorus and the rhythm of the ileum and caecum were markedly increased in rate following the actual ingestion of food. The total electrical activity of the pylorus and the duodenum was increased for a few min. when the S was placed in the experimental situation, but the caecum and ileum were not affected. The ileum did show a marked increase in the frequency of slow waves. It is concluded that increased movement of the gut occurs when the rabbit is placed in a situation where it normally receives food although the different regions of the alimentary canal respond in varying degree. It is possible that the increased activity of the pylorus and duodenum are

stimulated by the cephalic phase of classical conditioning, because this phenomenon disappears after vagotomy. (French summary) — *English abstract*.

8502. Smart, J. L. & Dobbing, John. (U. Manchester, England.) Vulnerability of developing brain: II. Effects of early nutritional deprivation on reflex ontogeny and development of behaviour in the rat. *Brain Research*, 1971, Vol. 28(1), 85-95. — During the last 2 wk of pregnancy and throughout lactation the food intake of female rats was restricted to about 1/3 that of a control group fed ad libitum. The growth, physical maturation, and behavioral development of control and undernourished male offspring were compared. At 21 days the body weight of the underfed young was 1/3 that of controls. The appearance of 2 out of 3 physical features, and of 4 out of 8 reflexes was significantly delayed in the undernourished group as were exploratory responses. Generally characteristics which normally appear in the 1st wk of postnatal life were not significantly affected, whereas most of those appearing later were significantly delayed. (18 ref.) — *Journal summary*.

ANIMAL PSYCHOLOGY

8503. Becker-Carus, Christian. (Max Planck Inst. of Psychiatry, Munich W. Germany.) Die Bedeutung der Tageszeit für Sensibilität, Reizaktivität und Entscheidungsaktivität bei Planarien (*Dugesia dorotocephala*). [The influence of time of day on sensibility, habituation and choice activity in planarians (*Dugesia dorotocephala*).] *Zeitschrift für Tierpsychologie*, 1970 (Oct), Vol. 27(7), 761-770. — 4 groups of planaria — morning, noon, evening, and night — were individually subjected to short electrical shocks every 60 sec. For the whole 17-day experimental period sensitivity in the evening and at night was considerably greater than in the morning and at noon. Habituation took place only during the 2nd 1/2 of the experimental period in the morning and evening groups, but during the whole experimental period for the noon and night groups. Strong responses were substituted by weak ones in all 4 groups. Choice behavior in a multiple Y maze showed that morning and night groups showed initially strong activity which sharply decreased during the experimental period. The activity of the noon Ss was weaker at the beginning but showed a slight tendency to increase during the test period. Maximum activity varied from midnight to morning to noon. Sensitivity was at a maximum between evening and midnight. — *K. E. Grossmann*.

8504. Duncan, I. J., Horne, A. R., Hughes, B. O., & Wood-Gush, D. G. (Agricultural Research Council, Poultry Research Centre, Edinburgh, Scotland.) The pattern of food intake in female brown leghorn fowls as recorded in a Skinner box. *Animal Behaviour*, 1970 (May), Vol. 18(2), 245-255. — Examined the temporal structure of feeding in fowls in a Skinner box. Each S exhibited a characteristic diurnal feeding rhythm with a sharp decline toward the end of the day. No periodicity was found between 20 min. and 4 hr. Some Ss showed bouts of feeding described as meals. Frequency distribution of interval between meal and meal size were of negative exponential form. Meal size was positively correlated with length of the interval that followed it. Positive correlation of meal size and the interval preceding it was inconsistent. A brief hypothesis con-

cerning the control of food intake in the fowl is postulated. — *M. Stöbel*.

8505. Emlen, Stephen T. (Cornell U., Div. of Biological Sciences.) The influence of magnetic information on the orientation of the indigo bunting, *Passerina cyanea*. *Animal Behaviour*, 1970 (May), Vol. 18(2), 331-334. — Examined, in 3 series of experiments, the hypothesis of geomagnetic orientation in migrating birds. (a) Directional preferences of caged buntings in a planetarium were observed only in the presence of celestial information and deteriorated to randomness with geomagnetic cues only. (b) Repeated testing with geomagnetic cues in a visual-cueless chamber failed to develop directional preferences. (c) Attempts to classically condition responses to directional change of 1-sec duration in the horizontal component of an artificially induced magnetic field have been unsuccessful. The hypothesis that indigo buntings can perceive and use static magnetic fields as directional cues was confirmed by the experimental data. (47 ref.) — *M. Stöbel*.

8506. Hangartner, Walter; Reichson, Jack M., & Wilson, Edward O. (Harvard U., Biological Lab.) Orientation to nest material by the ant, *Pogonomyrmex badius* (Latreille). *Animal Behaviour*, 1970 (May), Vol. 18(2), 331-334. — Results indicate that: (a) Workers separated from laboratory colonies of the harvesting ant preferred sand from their own nests over purified sand and sand originating from other nests of the same species. They were able to distinguish these materials by odor alone. (b) All of 8 closely grouped colonies in a wild population in Tampa, Florida, were able to recognize their own nest sand. (c) This ability to discriminate nest material appeared to be greater in the afternoon than in the morning. (d) The possible role of nest odors in the origin of colony odors and vice versa, is briefly discussed. — *Journal summary*.

8507. Jander, Rudolf. (U. Frankfurt/Main, Zoological Inst. W. Germany.) Ein Ansatz zur modernen Elementarbeschreibung der Orientierungshandlung. [An attempt at a modern elementary description of orientation activities.] *Zeitschrift für Tierpsychologie*, 1970 (Oct), Vol. 27(7), 771-778. — The steadily increasing scientific knowledge in ethology is lacking a definite system of definitions which makes factual-objective communication virtually impossible. Modern elementary description of orientation (as an example) should at least comprise the following 3 steps: (a) Discrimination between the orientational and the coordinational aspect of patterned movement as well as between the perceptual processes which localize and those which serve other functions. (b) Geometrical descriptions of movement in space: discrimination of distance, orientation and directional (rotational) orientation. Thereby 2 types of redirected oriented progression can be distinguished: of resetting of the afferent system (change of taxis) and of resetting of the efferent system (change of kinesis). (c) Discrimination is essential between instantaneous environmental stimuli, individual memory, genetic information (instinct), and stochastic processes. Endokinetic orientation must be distinguished from exokinetic orientation. The term "kinesesthetic orientation" is to be canceled. (24 ref.) — *K. E. Grossmann*.

8508. Keiper, Ronald R. (Pennsylvania State U., Mont Alto.) Studies of stereotype function in the canary (*Serinus canarius*). *Animal Behaviour*, 1970 (May), Vol. 18(2), 353-357. — Route-tracing and spot-picking, 2

stereotypies of caged canaries, were observed in 5-min periods. Presentation of both novel stimuli (plastic head and a mirror) and social stimuli (view of a bird in an adjacent cage) significantly reduced both stereotypies. Grouping of birds also caused a decrease by physically disrupting the stereotypies. Administration of sex hormones activated alternate behaviors which reduced the number of route-tracings. These results suggest that in caged canaries these stereotypies occur primarily to supply the bird with a source of stimulation. (15 ref.)—*M. Strobel*.

8509. Martinek, Z. & Lát, J. (Czechoslovak Academy of Sciences, Inst. of Physiology, Prague) **Long-term stability of individual differences in exploratory behaviour and rate of habituation in dogs.** *Physiologia Bohemoslovaca*, 1969, Vol. 18(3-4), 217-225.—Tested 13 young and 10 adult laboratory dogs of Horák's breed at 10-mo intervals: Results indicate significant long-term stability of (a) individual differences in various indicators of exploratory activity, particularly the frequency of grid-crossings, rearings, or duration of locomotion; (b) a composite indicator comprising the frequency of grid-crossings, rearing, or sniffing; and (c) individual rates of habituation to a new environment. These results were also obtained with young Ss, tested pre- and postpuberty, indicating that the changes associated with sexual maturation did not significantly influence the stability of the selected indicators. (20 ref.)—*Journal summary*.

8510. Oppenheim, Ronald W. (Dorothea Dix Hosp., Raleigh, N.C.) **Some aspects of embryonic behaviour in the duck (*Anas platyrhynchos*).** *Animal Behaviour*, 1970(May), Vol. 18(2), 335-352.—A total of 321 Peking and mallard duck and white leghorn chick embryos were used in a series of observations and experiments on embryonic behavior. It was observed that amount of movement increased with embryonic age from Day 5 to Day 17. Activity occurred in bursts. Beginning at Day 22 the embryo assumed hatching position. 16 hr. prior to hatching a sudden increase in back movement of the head led to hatching. Sequence and character of movement were similar to the chick embryo. Contrary to earlier reports, neither head movement nor bill clapping was affected by lifting the right wing from its normal position over the embryo's head. (38 ref.)—*M. Strobel*.

8511. Vince, Margaret A. & Cheng, R. (Psychological & Statistical Lab., Cambridge, England) **The retardation of hatching in Japanese quail.** *Animal Behaviour*, 1970(May), Vol. 18(2), 210-214.—Examined the natural conditions which retard hatching in Japanese quail. In Exp. I, reducing the difference between normal and delayed eggs to 15 hr. gave negative results. In Exp. II, by increasing the number of delayed eggs with which the quail embryo was in contact, it was shown that hatching can be retarded. Thus, retardation is a function of amount of retarding stimulation.—*M. Strobel*.

8512. Webb, Wilse B. & Friedman, Joyce. (U. Florida) **Attempts to modify the sleep patterns of the rat.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 459-460.—Utilized 3 extensive behavior control procedures to modify sleep patterns in 38 male Long-Evans rats: (a) restriction of activity from weaning for 3 mo., (b) prevention of sleep during a set 6-hr period/day by wheel enforced movement for 30 days, and (c) shock contingently associated with the onset of sleep during a set and well cued 6-hr period/day for 10 days. Little or no modification of any enduring character was found

when compared with control conditions. Data suggest a strong inherent control of the sleep response in the rat.—*Journal abstract*.

COMPARATIVE PSYCHOLOGY

8513. Crook, John H. (U. Bristol, England) **Social organization and the environment: Aspects of contemporary social ethology.** *Animal Behaviour*, 1970(May), Vol. 18(2), 197-209.—Discusses developments within ethology, focusing on the relations between social behavior, ecology, and population dynamics. In socioecology, recent studies reveal that close correlations exist between the forms of avian and mammalian social organization and their respective ecological niches. In sociodemography, research suggests that socially mediated mortality is of great significance in the density-dependent control of bird and mammalian numbers. Studies of social processes outline the dynamics of social change within relatively stable group structures through the relationships between dominance, kinship, and competition-contingent cooperation. (62 ref.)—*M. Strobel*.

8514. Pollard, J. S., Baldock, M. D., & Lewis, R. F. (U. Canterbury, Christchurch, New Zealand) **Learning rate and use of visual information in five animal species.** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 29-34.—Conducted 2 experiments with cross-bred domestic fowls and compared learning rates and use of visual information with those found for species in previous studies. In Exp. I, 18 Ss were run on standard closed field test problems and their performance compared with that of rats, cats, possums, and ferrets. Ss exhibited learning rates similar to those of possums and lower than those of rats, cats, and ferrets, but showed little use of available visual cues. In Exp. II, 12 Ss were run through the same problems with the walls of the maze problems painted black instead of white while the maze pathway remained white. While their learning rates remained unchanged, Ss made fewer errors in the high contrast maze and gave evidence of using visual cues in a manner similar to cats. The 2 experiments demonstrate the value of "control by equation" for interspecies comparison, i.e., of using proportional rather than absolute measures of performance in describing and interpreting the performance of different species on learning tasks.—*Journal abstract*.

8515. Radabaugh, Dennis C. (Ohio State U.) **A comparative study of learning in two species of centrarchid fish.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5719-5720.

8516. Williams, D. I. (U. Hull, England) **Ethology and human behaviour.** *Bulletin of the British Psychological Society*, 1971(Jan), Vol. 24(82), 17-22. Analyzes the feasibility of drawing inferences about human behavior from observation of the so-called lower orders of the animal kingdom. It is argued that animals are not merely analogues of human behavior; they are complex organisms in their own right. It is cautioned that we would be wise to learn from them, to model our theories on insights that we can only gain by artificially structuring their lives, but that ultimately the only model for the behavior of man is man. (16 ref.) *V. S. Sexton*.

NATURAL OBSERVATION

8517. Brown, Jerram L. (U. Rochester, Center for

Brain Research) Cooperative breeding and altruistic behaviour in the Mexican jay, *Aphelocoma ultramarina*. *Animal Behaviour*, 1970(May), Vol. 18(2), 366-378. A flock of Mexican jays consists of 8-20 birds, typically 2 or more breeding pairs and a number of nonbreeding yearlings and adults. The feeding of the nestlings was shared by all flock members with 38-53% of the feeding visits by the parents and the remainder by altruistic jays. Parents showed a significant preference for feeding their own nestlings as long as they remained in the nest. After the young left the nest the parents no longer showed a preference for feeding their own fledglings.—M. Strobel.

8518. Davis, G. James & Lussenhop, John F. (U. Wisconsin) Roosting of starlings (*Sturnus vulgaris*): A function of light and time. *Animal Behaviour*, 1970(May), Vol. 18(2), 362-365. Starlings were observed returning to roost from August 21 to October 1, 1966. Initial departure towards the roost was closely correlated with light intensity. The time of departure from the feeding areas would probably show a better correlation with light intensity than would the time of departure for the 1st and final assemblies. Starlings arrival at the roost was not simply a function of the light-time stimulus, but also depended on the light intensity at the time starlings began flying, the varying distances they had to fly to the final roost, and behavioral interactions en route (16 ref.)—*Journal summary*.

8519. Fishelson, Lev. (Tel-Aviv U., Israel) Behaviour and ecology of a population of *Abudefduf saxatilis* (Pomacentridae, Teleostei) at Eilat (Red Sea). *Animal Behaviour*, 1970(May), Vol. 18(2), 225-237. —Describes the habitat, schooling, feeding, and reproductive behavior over a 1-yr period, under natural conditions. The fish inhabiting shallow waters spend the night separately in coral crevices and gather after sunrise in groups to feed on plankton. Schooling appears after feeding as a preliminary to establishing breeding colonies. The male builds a nest and invites a female with special action patterns. Entrance of the female in the nest releases spawning behavior. The male spawns with several females consecutively. Frequency and correlation of action bonds are strongly dependent on the strength of the producing stimulus. During the winter schooling disappears. (27 ref.)—M. Strobel.

8520. Henshaw, John. (Box 593, College, Alaska) Consequences of travel in the rutting of reindeer and caribou (*Rangifer tarandus*). *Animal Behaviour*, 1970(May), Vol. 18(2), 256-258. Observations of rutting reindeer indicate that during herding, breeding was greatly intensified and that courtship behavior exhibited in stationary groups did not occur. This may be explained by concepts which illustrate movement, high density of animals, high excitement, and antler contact as possible erotic stimuli. The maintenance of movement, as well as high density, appears to be important to caribou during the rutting season. *Journal summary*.

EARLY EXPERIENCE

8521. Angermeier, W. & Phelps, J. (Florida Presbyterian Coll., Primate Neurosciences Lab.) Early experience and levels of noxious stimulation in monkeys. *Psychologische Forschung*, 1971, Vol. 34(3), 247-252. —"An analysis conducted in retrospect revealed

that monkeys reared in isolation had a lower threshold level of shock (RLS) in order to perform a continuous operant task than did monkeys reared in environments which permitted varying degrees of visual, tactile, and social stimulation. This behavior prevailed (a) under conditions of both avoidance and escape training and (b) at the time of initial exposure to shock and (c) thereafter. A limited confirmation of Fuller's theory of "sensitization" is discussed"—R. Gunter.

8522. Carter, Carol S. & Marr, John N. (U. Arkansas) Olfactory imprinting and age variables in the guinea-pig, *Cavia porcellus*. *Animal Behaviour*, 1970(May), Vol. 18(2), 238-244. —Neonates reared with mothers or littermates which had natural, ethyl benzoate acceptance odors showed preferences for the real mothers in a choice test after exposure of 15 or 30 days. Preference scores increased with length of exposure time. The 15 day (13 day of age) exposure was most effective. No exposure at a later time. Regardless of age or duration of exposure to an experimental odor, groups showed a preference for a natural odor when tested at 60 days of age.—M. Strobel.

8523. Deutsch, Robert & Roberts, Larry E. (McMaster U., Hamilton, Ontario, Canada) Effect of aversive stimulation and early handling on skin conductance, defecation and activity in *Mus musculus*. *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 125-127. —Conducted 2 experiments with 25 and 12 female hybrid mice to determine the effects of an aversive stimulus (sustaining of 17 and early handling. Presentation of aversive stimulus always elicited an increase in skin conductance and defecation, but the locomotor response was a decrease early in testing and an increase later on. Early handling abolished each component of the response pattern. Results suggest control of the electrodermal system by a mechanism that regulates emotional defecation and agonistic locomotor responses. Autonomic responses occur whenever this mechanism is aroused but the locomotor response that follows depends upon cues that are present and S's previous experience with them. *Journal abstract*.

8524. Flittinghoff, N. A., Lindburg, D. G., & Mitchell, G. (National Center for Primate Biology, Davis, Ca.) Failure to find polydipsia in isolation-reared monkeys. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 277-278. —Compared the water consumption of 6 adult male rhesus monkeys, reared in social isolation, with that of 5 fetal-reared controls. Isolate polydipsia, reported elsewhere, was not found in the present study. A possible explanation of this unexpected result (difference in relative ages of Ss) is presented.—*Journal abstract*.

8525. Malakhovskaya, D. B. & Dmitrieva, L. E. (Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) O posledstviyakh trenirovki vrozhdennyykh refleksov v rannem postnatal'nom periode. [On the effects of training inborn reflexes in the early postnatal period.] *Zhurnal Vysshego Nervnogo Deyatel'nosti*, 1970(Sep.), Vol. 20(5), 955-960. —123 rabbits were used to study the effects of methodical evocation of the cleaning reflex, elicited by electrostimulation of the skin of the post-erolateral surface of the neck. Each experimental session employed 10 such stimulations, 91 Ss were subjected to only 1 session at the age of 5-49 days; 32 Ss, to daily sessions for 8 wk from the age of 5 days. In Group 1 the main form of reaction to the stimulation was scratching movements with lesser or greater participation of other cleaning reactions, depending on age (early or later).

respectively). In Group 2 the character of development of the reflex was different: replacement of the scratching reflex by the shaking reflex. Thus, early methodical evocation of the cleaning reflex affects its development. (English summary)—*I. D. London.*

8526. Miller, Barbara V. & Levis, Donald J. (U. Iowa) **The effects of long-term auditory exposure upon the behavioral preference of rats for auditory stimuli.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 178. —Conducted 2 experiments with a total of 150 rats who were reared from birth in constant tone and nontone environments and subsequently tested with tone and white noise stimuli. Tone-reared Ss indicated no preference for tone, absence of tone, or white noise. Non-tone-reared Ss preferred the tone to white noise. Tone-reared Ss were significantly heavier and less emotional in open-field testing. Results (a) pose difficulty for the hypothesis that exposure to a stimulus increases its attractiveness, and (b) supports the hypothesis "that long-term exposure to tone retards learning of a stressful but not a nonstressful task."—*S. Knapp.*

8527. Nagy, Z. Michael & Anderson, James A. (Bowling Green State U.) **Body temperature reduction in young C3H mice following removal from the nest.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 101-102. —Examined the ability of 140 young C3H mice to maintain nest-level body temperatures upon removal from the nest as a function of age. Separate groups of Ss were tested at 1, 5, 8, 10, 12, 15, or 20 days of age. Ss were placed in small chambers maintained at 24° C, and colonic temperatures were recorded immediately upon removal from the nest, and 3 and 15 min. following exposure to 24° C. Results demonstrate that Ss less than 12 days of age exhibited losses in body temperature, with younger Ss showing the greater losses, while Ss older than 12 days increased their temperatures over the 15-min interval.—*Journal abstract.*

8528. Nielsen, Thomas C. (U. Aarhus, Inst. of Psychology, Denmark) **Visual and tactual exploration in rats reared in different degrees of visual and tactual stimulation.** *Scandinavian Journal of Psychology*, 1971, Vol. 12(1), 53-60. Reared 4 groups of 8 male albino rats in 4 possible combinations of high and low visual and tactual stimulation. Early tactual enrichment increased later tactual exploration regardless of visual stimulation. Visual enrichment did not influence exploration in the tactual enrichment groups, but in the tactual deprivation groups it seemed to produce more visual and less tactual exploration. The most deprived group exhibited a higher locomotor activity which could not be explained in terms of an increased tendency to explore.—*Journal abstract.*

8529. Quadagno, David M. & Banks, Edwin M. (U. California, Medical School, Los Angeles) **The effect of reciprocal cross fostering on the behaviour of two species of rodents, *Mus musculus* and *Baiomys taylori*.** *Animal Behaviour*, 1970(May), Vol. 18(2), 379-390. —*Baiomys* and *Mus* pups were cross-fostered and their adult behavior compared with controls. Open field activity increased in cross-fostered *Baiomys* and decreased in cross-fostered *Mus* indicating differential handling by the dams. Results from the social preference tests indicate that females were more affected by cross-fostering than males. Pair encounters revealed on fighting, grooming, attempted mounts, approach, and withdrawal behavior that cross-fostered Ss were reacting

more positively to the foster species than to conspecifics. Cross-fostered male and female *Mus* did not lose their ability to mate with a conspecific which implies that sexual behavior in this species is less susceptible to change due to early experience than other social behavior. (26 ref.)—*M. Strobil.*

8530. Schlottmann, Robert S. (Louisiana State U., Agricultural & Mechanical Coll.) **Mother-infant separation in the java monkey (*Macaca irus*).** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5641.

8531. Thoman, Evelyn B. & Komer, Anneliese F. (Stanford U., Medical School) **Effects of vestibular stimulation on the behavior and development of infant rats.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 92-98. —Assigned 181 newborn rats from 19 litters to 1 of 3 groups which were (a) swaddled and rotated, with brief periods of nonrotation; (b) swaddled only; or (c) given no treatment. Treatment was given daily for 10 min. for 14 days, beginning on the 1st day after birth. Vocalization was observed during the treatment periods. Observations of cessation of crying during rotation indicate that vestibular stimulation is a highly effective stimulus for arresting the distress call of the infant rat from the 1st day of life. The developmental effects of rotation were evident in increased exploratory behavior at 20 days of age and in higher weaning weights. These effects were clearly attributable to the addition of vestibular stimulation to the stimuli provided by handling and swaddling.—*Journal abstract.*

8532. Walk, Richard D. & Bond, Elizabeth K. (George Washington U.) **The development of visually guided reaching in monkeys reared without sight of the hands.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 115-116. —Conducted a modified replication of a study by R. Held and J. Bauer (see PA, Vol. 41:5770). 2 male macaque monkeys were reared without sight of the hands. Ss were taught to reach toward a dowel stick they could see. When the hands were uncovered, neither prolonged hand watching nor inability to reach toward objects was observed. Ss reached toward gross objects on the 1st day and gradually improved. It is concluded that visual deprivation of the sight of the hands did not appear to hinder visually guided reaching as much as the Held-Bauer study indicated.—*Journal abstract.*

INSTINCTS

8533. Gallup, Gordon G., Nash, Richard F., & Fillson, Alton L. (Tulane U.) **Tonic immobility as a reaction to predation: Artificial eyes as a fear stimulus for chickens.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 79-80. —In 2 experiments with 60 Production Red chickens, it was found that young habituated Ss exposed to artificial eyes suspended overhead remained immobile in response to manual restraint appreciably longer than did controls and were more susceptible to immobility. Results are discussed in relation to a defensive-distance dimension and in terms of the notion that tonic immobility may have evolved in response to predation.—*Journal abstract.*

8534. Lee, C. T. & Estep, Daniel. (U. Texas) **The developmental aspect of marking and nesting behaviors in Mongolian gerbils (*Meriones unguiculatus*).** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 312-313. —Studied developmentally the marking and nest-building behaviors of 10 male and 10 female gerbils. Ss of

both sexes began to mark at 2 wk. of age, though males did not mark more often than females until 4 wk. of age. Both males and females were able to use scent to build nests at 8 wk. of age. No sex difference was found in initial consumption at any age level. The marking and nesting activities were positive functions of age. *Journal abstract*

8535. Selman, I. E., McEwan, A. D., & Fisher, E. W. (Glasgow U., Veterinary School, Scotland.) Studies on natural suckling in cattle during the first eight hours post partum. I. Behavioural studies (dams). *Journal Behaviour*, 1970(May), Vol. 15(2), 284-289. —Observed the behaviour during the 1st 8 hr postpartum of 30 cows and heifers, particularly the position at parturition, locking and grooming, maternal orientation, maternal rejection, and resting behaviour. Marked elevations in a set pattern of activity were recorded on only a few occasions, but it was nevertheless concluded that the experienced dams were the best mothers. (28 ref.) *Journal summary*

8536. Selman, I. E., McEwan, A. D., & Fisher, E. W. (Glasgow U., Veterinary School, Scotland.) Studies on natural suckling in cattle during the first eight hours post partum. II. Behavioural studies (calves). *Journal Behaviour*, 1970(May), Vol. 15(2), 284-289. —Observed the behaviour of 30 calves during the 1st 8 hr postpartum, particularly behaviour prior to standing, teat seeking, and suckling. In the majority of cases a very similar pattern of behaviour was exhibited. However, wide variations were found to occur in the time for 1st suckling. 7 of the 30 calves did not suckle during the observation period. Several reasons for delayed suckling are defined. (17 ref.) *Journal summary*

MOTIVATION & EMOTION

8537. Badia, Pietro & Culbertson, Stuart. (Bowling Green State U.) Stimulus induced attenuation of rat vocalizations to tail shock. Shock intensity effects. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 267-268. —Reports 3 studies with a total of 10 male and 1 female naive Holtzman albino rats, dealing with induction of distress vocalizations to shock by a preceding stimulus. 2 factors were considered: shock intensity and postural adjustments. Shock intensity was varied in 2-V steps from 8-18 V in Study A, 12-22 V in Study B, and 18-28 V in Study C. Postural changes were controlled by using a restraining cage and applying shock to the tail. Stimulus-induced suppression was relatively constant at intermediate intensities but at the highest intensities it did not occur. Number and duration of vocalizations increased with intensity. Postural adjustment was not a factor. *Journal abstract*

8538. Burghardt, Gordon M., Asken, Henry, & Musmeci, Marilyn. (U. Tennessee.) A supplementary note on the feeding behavior of the lizard, *Anolis carolinensis*. *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 49-50. —Takes issue with the statement of H. Asken, M. Musmeci, I. Smare, and I. Stephan (see 8A, Vol. 45:403) that there has been little research on repulsive feeding behavior. Other studies, including 3 by G. Burghardt, are noted. Special note is made of 1 of these studies, which is considered nearly identical to that of Asken, et al. A reply by Asken and Musmeci argues that (a) previous research is comparatively limited and different in nature, and (b) that their experiment was different in procedure and in variables investigated. S. Knapp

8539. Colquhoun, George L. (Princeton U., Adjunct Research Lab.) Partitioning of a restricted food source in a territorial iguanid (*Anolis carolinensis*). *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 50-51. —Reports on the effects of behavior of 6 pairs of lizards each day for 5 days following a 48-hr deprivation period. Each pair of Ss was observed in an ad libitum food situation for all pairs. 1 S dominated the food situation throughout the observation period. Food offered during the 1st day of observation was taken by the dominant Ss by the dominant and subordinate Ss. Food offered on the 5th day was taken by the dominant Ss (90.4%). This difference was statistically significant ($p < .031$) and suggests that territoriality can function to ensure the holder of that territory access to most of a limited food supply. *Journal abstract*

8540. Coover, Thomas L., & Powell, D. A. (Chiswick Animal Hospital & Hosp., Denver, Colo.) Effects of age and housing conditions on shock-induced aggression. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 269-270. —In an experiment with 24 experimental rats, it was demonstrated that the variability of aggression rates over sessions was, in part, a function of age. As the Ss were housed outside the experiment, age was not shown to be an important determinant of elicited aggression, primarily because the effects of this variable were confounded by housing conditions. *Journal abstract*

8541. Driver, Paul & Renner, K. Edward. (U. Illinois.) Self-punitive behavior: Masochism or confusion? *Psychonomic Science*, 1971(Jul), Vol. 78(4), 333-337. —Considers the phenomenon of self-punitive behavior in rats. A possible experiment was conducted with 22 naive female Ss. Previous work had suggested that by choosing to receive a painful shock, the rats were showing a preference for punishment thus providing an analogue for masochism. This extension to masochism was considered inappropriate, however, because of the use of the concept of choice and the attribution of a state of preference to the S without an adequate preference methodology. The apparent paradoxical effects of punishment fees in self-punitive behavior were resolved by making a conceptual distinction between instrumental learning about response-contingent outcomes (expectancies) and motivational states (preference). *Journal abstract*

8542. Hargrave, George F., & Bolles, Robert C. (U. Washington.) Rat's aversion to flavors following induced illness. *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 91-92. —Established preferences in 24 male Long-Evans rats for 1 of 2 flavors of a novel food. Ss were then trained in a $2 \times 2 \times 2$ factorial design varying flavor, environment, and ip injections of 15% isotonic NaCl solution. Results confirm previous reports that rats can learn from a single induced illness to avoid a novel food encountered just prior to becoming ill, and indicate the relative specificity of the adequate stimulus. Rats appear to avoid the taste of the illness-associated food but not its smell or its location. *Journal abstract*

8543. Kierckoper, H., et al. (Texas A & M U., Inst. of Life Science.) An analysis of locomotor behaviour of goldfish (*Carassius auratus*). *Animal Behaviour*, 1970(May), Vol. 18(2), 317-330. —The movements of individually observed naive goldfish, 25-30 cm long in a novel open field tank $5 \times 5 \times .5$ m deep were con-

tinuously monitored during periods from 11-69 hr. The size, direction, and sequence of turns, length of steps, and velocities were computed, and their relationships analyzed by an online computer system. Locomotor patterns and the effects of time (decrease in novelty content) were assessed in the light of available data in other species. It is concluded that spontaneous alternation may be related to orientation but not to exploratory behavior. (91 ref.)—*Journal summary.*

8544. Knutson, John F. (U. Iowa) **The effects of shocking one member of a pair of rats.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 265-266.—In an experiment with 10 experimentally naive male hooded rats, it was found that when 1 member of a pair of Ss was insulated from electric footshock, a frequency of aggression was obtained which was far lower than that which has typically been reported in the shock-elicited aggression literature. Also the shocked Ss developed a relatively high frequency of stereotyped responses which served as partially successful avoidance responses. Data support earlier data indicating that avoidance or escape responses to shock will take priority over attack responses to shock.—*Journal abstract.*

8545. Oatley, Keith & Dickinson, Anthony. (U. Sussex, Lab. of Experimental Psychology, Brighton, England) **Air drinking and the measurement of thirst.** *Animal Behaviour*, 1970(May), Vol. 18(2), 259-265.—Compared air licking and water licking in 34 adult male rats. Results indicate that: (a) Number of licks on a water spout and on a low or high pressure air stream hose were nearly a linear function of length of deprivation. (b) Histograms of intervals between licks were also similar for water and air. (c) Ss took more licks to air than to water and rate of licking air did not diminish as fast as for water. This would be expected if air had its mildly satiating effect in providing decaying short-term feedback. (d) Part of the satiating effect of air may be due to gut distension. (e) Air drinking, although it does not remove all feedback from drinking provides a useful measure of thirst, free of the absorptive effects of drinking water.—*M. Strobel.*

8546. Palfai, Tibor; Kutscher, Charles L., & Symons, James P. (Syracuse U.) **Schedule-induced polydipsia in the mouse.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 461-462.—Gave 4 male mice a food pellet every 150 sec. for 3 hr. All Ss developed polydipsia. When the scheduled feeding was discontinued, water intake decreased. Polydipsia redeveloped following the reintroduction of the schedule immediately or after 9 days of ad lib feeding. High negative correlations existed between water intake and body weight in all Ss.—*Journal abstract.*

8547. Platt, Jerome J., Reiser, David L., & Merkner, James. (Hahnemann Medical Coll.) **Response to stimulus change and related temporal parameters in rabbits and guinea pigs.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 173-178.—Reports on the performance of rabbits and guinea pigs in the response to the stimulus change paradigm. Rabbits responded to stimulus change at better than the .001 level while guinea pigs did not respond at a probability level significantly different from chance. An examination of temporal parameters revealed that length of time spent exploring the choice point on both the familiarity and test trials was significantly related to having made the predicted response for rabbits, but not for guinea pigs.—*Author abstract.*

8548. Strouthes, Andrew. (State U. New York,

Binghamton) **Thirst and saccharin preference in rats.** *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 287-292.—Conducted 3 experiments with a total of 112 water-deprived adult male albino Sprague-Dawley rats. Ss initially showed higher water than saccharin consumption regardless of whether the liquids were presented singly or as a choice, and whether food was available or withheld during testing. More saccharin than water was consumed later. The reversal from water to saccharin was positively related to hours of water deprivation and percent saccharin concentration and occurred with either continuous or interrupted exposure. It is concluded that rats must 1st drink water in order to reduce their water deficit to some threshold before saccharin is drunk. Postingestional and oral factors then become responsible for ingestion of large quantities of saccharin.—*Journal abstract.*

LEARNING

8549. Corning, W. C. & Lahue, R. (U. Waterloo, Ontario, Canada) **Reflex "training" in frogs.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 119-120.—Investigated the report that repeated stimulation of a point on the dorsal skin of the frog will result in a specific enhancement of the wiping reflex of that zone. Tests of the specificity of this enhancement in 10 frogs (*Rana pipiens*) demonstrate that all areas of the skin and all wiping reflexes were sensitized when the S was given reflex "training." Handling 10 controls indicates that the increased nonspecific response rate may be due to factors other than learning.—*Journal abstract.*

8550. Cranford, Jerry L. & Clayton, Keith N. (Indiana U.) **Stimulus novelty effects during stimulus equivalence testing.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 30.—Analyzed the transfer test data from an experiment which factorially combined percent reward (50 vs. 100%) and duration of confinement (2 vs. 20 sec.) in the presence of cue values from 2 redundant stimulus dimensions. Rats performed better on test trials which paired the previously negative cues with novel compound cues than on trials in which the previously positive cues were paired with a novel compound. Long confinement durations and partial reward during acquisition increased this difference. Results give further evidence that novelty affects test performance in single-dimensional transfer tests following redundant cue training.—*Journal abstract.*

8551. Meltzer, Donald & Freeman, Betty J. (Southern Illinois U.) **Maintenance of response summation under conditions of minimum stimulus intensity.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 287-289.—Conditioned 4 male hooded rats on a multiple schedule, in which different composite stimuli were associated with extinction and a variable-interval reinforcement schedule. The composite extinction stimulus consisted of light plus tone. The composite stimuli associated with reinforcement were light plus silence and tone plus darkness. After response rate had stabilized, 3 test intervals were presented to an S in each session. During 2 of the test intervals the composite stimuli were the same as the stimuli associated with reinforcement. During the 3rd test interval the composite stimulus was darkness plus silence. Response rate was highest during the 3rd test interval, and this rate difference was maintained for 60 sessions.—*Journal abstract.*

8552. Premack, David. (U. California, Santa Barbara) **Language in chimpanzee?** *Science*, 1971(May), Vol. 172(3985), 808-822.—Efforts to teach language to a chimpanzee involved 2 sets of problems: (a) developing a list of exemplars (things an S must do to give evidence of language); and (b) a corresponding list of instructions for training. The training effort reported concerns an African-born female chimpanzee about 6 yr. old when the study began. Essential elements of training involved (a) establishing a transaction between the S and trainer, and (b) deciding on the salient perceptual classes into which the transaction should be divided. As each new class was developed, the language requirement was increased accordingly. S's ability to acquire language based on this training procedure is traced through a variety of exemplars. Photographs are included of pieces of plastic representing units of language. (20 ref.)—*P. McMillan*.
8553. Saunders, J. C., Teague, Joy; Slonim, Deborah, & Pridmore, P. A. (Monash U., Clayton, Victoria, Australia) **A position habit in the monotreme *Tachyglossus aculeatus* (the spiny ant eater).** *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 47-51.—Trained 4 animals of the species *Tachyglossus aculeatus* to make a position response on a T maze task. During acquisition the number of correct choices as well as running speed systematically improved. Extinction of the habit showed a return to chance behaviors and lengthening of running time. It is concluded that the T maze task is a satisfactory method for studying learning in this species.—*Journal abstract*.
8554. Smith, Stanley G. & Malott, Richard M. (U. Mississippi) **An analysis of the nonmatching components of the stimulus matching paradigm.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 73-75.—Trained 2 naive White Carneaux pigeons on a simultaneous split-field single-key stimulus-matching procedure. The decline of keypecking during nonmatching stimuli was examined. Observations during nonmatching conditions indicate that as keypecking declined discrete overt patterns of behavior emerged to each of the 2 nonmatching compounds. The decline in keypecking and the emergence of discrete overt patterns of behavior was observed to occur 1st to 1 nonmatching compound and then to the 2nd combination. (20 ref.)—*Journal abstract*.
8555. Thomas, R. David; Ernst, A. John, & Andry, Diane K. (U. Colorado) **More on masking of stimulus control during generalization testing.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 85-86.—Gave 24 domestic pigeons single-stimulus training with a white vertical line on a yellow (576 nm.) background. For $\frac{1}{2}$ the Ss, the houselight was on during the entire experiment, while for the other $\frac{1}{2}$ it was off. A generalization test along the angularity dimension was conducted, with the 576-nm surround present on only $\frac{1}{2}$ the stimulus presentations. In the houselight-off group, the relative generalization gradient was flatter with the yellow surround present, indicating masking of angularity by wavelength; however, there was no such difference in the houselight-on group.—*Journal abstract*.
- Conditioning**
8556. Baker, Thomas W. & Lougee, Michael. (Lawrence U.) **Determinants of the conditioned suppressive properties of a stimulus.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 61-63.—Manipulated probability of signaled shock, shocks/total CS duration, contingency of CS and shock, and shock density in a CER paradigm. 12 Wistar and 24 Sprague-Dawley albino male rats served as Ss. Both contingencies and shocks/total CS duration were found to influence amount of suppression. Relationships between probability of signaled shock and CS duration are discussed.—*Journal abstract*.
8557. Byrum, Ronald P. & Jackson, Donald J. (Eastern Michigan U.) **Response availability and second-order conditioned suppression.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 106-108.—Followed CER training days, 18 male Sprague-Dawley rats were given 2nd-order conditioning (SOC) trials under 1 of 2 conditions: (a) response lever present during all 10 SOC days, and (b) lever absent during the 1st 3 SOC days. There was noise; CS, was a flashing light. A 2nd experiment with 16 Ss reversed the 1st- and 2nd-order stimulus. Ss were given 5 days of SOC with the lever absent for $\frac{1}{2}$ the Ss. In both studies, when the lever was returned for all subsequent SOC days showed no significant difference between groups with respect to either acquisition of SOC or extinction of 1st-order conditioning. Results offer support to A. Kamil's (see PA, Vol. 43:6623) hypothesis that his failure to find a correspondence between 1st- and 2nd-order conditioned suppression might be due to counterconditioning of CS, to the food reinforcement obtained during SOC.—*Journal abstract*.
8558. Daurova, F. K. & Kolotygina, R. F. (Inst. Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Issledovanie spetsifichnosti obratnykh svyazei.** [An investigation of the specificity of feedback connections.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1083-1085.—3 dogs were Ss in a study to test whether feedback, like the direct CR, possesses the property of specificity. The method considered adequate to investigate this question, employed under the same experimental conditions, was an indifferent stimulus (vibrator), "covered" by an alimentary UCS, and another stimulus (tone), "covered" by a nociceptive UCS (electroshock). If feedback possessed specificity, the test ("covered") stimulus should evoke the reaction of that UCS with which it was combined. Under the experimental conditions reactions to the isolated application of the test stimuli did not appear in all Ss, showing up not more than 50-75% of the time. However, if a reaction to the tone appeared, it was always defensive in character. Alimentary or mixed reaction never appeared. Similarly for the reaction to vibrator which was always alimentary in character. The specificity of feedback is taken as evidence for its CR nature.—*I. D. London*.
8559. Dobrovolskaya, V. N. (Pavlov Inst. of Physiology, Leningrad, USSR) **Osobennosti pishchevogo povedeniya v ontogeneze u sobak.** [Features of alimentary behavior in ontogenesis in dogs.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 961-968.—Experimental materials on 46 2-8 mo. old puppies were extracted from the archives of the Pavlov Institute of Physiology and subjected to reanalysis and statistical treatment, in order to elucidate several age-specific and individual features of alimentary-motor behavior in their ontogenetic aspect. Elaboration of a motor CR to the place of alimentary reinforcement under conditions of complex choice took place more slowly in 2-mo-old Ss than in older Ss. A wide range of

iological Psychology, 1971(Jun), Vol. 76(1), 137-144. —Used a CER procedure to investigate blocking of inhibitory Pavlovian conditioning in 3 experiments with 16 male Sprague-Dawley rats each. Relative to a prior treatment involving only free shocks, a prior treatment in which occurrences of a visual CS were negatively correlated with occurrences of electric shock reduced the magnitude of the inhibitory CR elicited by a redundant auditory CS which subsequently was added to the visual CS. Following inhibitory conditioning to the compound, there was no evidence that the added auditory CS elicited a larger inhibitory CR than did a novel stimulus in a control group. Retention of an inhibitory CR to the auditory element of the compound CS was no more affected by interpolated inhibitory conditioning to the visual element than it was by interpolated free shocks. —*Journal abstract.*

8568. Varga, M. E., Kuznetsova, G. D., & Myslobodskii, M. S. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Izmenenie senzornogo poslerazryada na svet v khode vyrobotki klassicheskogo oboronitel'nogo uslovnogo refleksa u krysa*. [Alteration of sensory afterdischarge in response to light in the course of elaborating a classical defensive conditioned reflex in rats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 975-981. —Ss were 18 white rats (CS was 5 flashes of light at 1-sec intervals; UCS was electrostimulation of the snout, starting with the 4th flash and including the 5th; UCR was a washing reaction). During elaboration of the CR, recordings were made of (a) the evoked responses to light, (b) the EEGs of the visual and sensorimotor cortical areas, and (c) the EMG of the cervical muscles. In the process of developing the conditioned connection, sensory afterdischarges were suppressed, occurring sooner, the more intense the unconditioned reinforcement. The number of sensory afterdischarge waves to each of the 5 flashes was inversely related to the numerical order of the flash. A new situation, hunger, and any indifferent stimuli, eliciting an orienting reaction, had the same blocking effect. An increase in sensory afterdischarges occurred in quiet customary settings, with a decrease in the intensity of painful reinforcement, and during extinction of the CR. It is concluded that the character of the changes in the cortical reactions to the CS, and the number of sensory afterdischarges is a function of the cerebral activation level at the given time and is not connected with the specific details involved in the establishment of a conditioned connection. (English summary) (30 ref.) —*I. D. London.*

8569. Voevodina, O. N. & Khananashvili, M. M. (Pavlov Inst. of Experimental Medicine, Leningrad, USSR) *Formirovaniye i vzaimodeystviye dvukh sistem uslovykh refleksov, vyrobotannykh odnovremennno pri stereotipnom i sluchainom poryadkakh podkrepleniya signalov*. [Formation and interaction of two systems of conditioned reflexes, elaborated simultaneously with stereotypic and random reinforcement of signals.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1970(Sep), Vol. 20(5), 1076-1078. —2 situational motor-alimentary CRs were simultaneously elaborated in 2 dogs, with (a) location of the S in the experimental chamber assuming "signal significance," and (b) reinforcement delivered in "stereotypic (rhythmic) and random order." The data showed that in both cases 2 nervous processes emerged, to a considerable degree independent of each other: 1 of which was characterized

by a rhythmic form of cerebral reaction; the other a reaction to each signal. At the same time a mutual influence of these systems upon each other was observed so that, for example, the system, being organized on a basis of random reinforcement, began to pursue a rhythmic course. As the number of experimental sessions increased, general symptoms, pointing to difficulties in flow of higher nervous activity, arose. With the elaboration of 2 systems, random reinforcement in the formation of behavior became the leading factor in the emergence of these symptoms, and the sharper emotion-tension induced by conflict of the excitatory and inhibitory processes. —*I. D. London.*

Discrimination

8570. Danson, Carl & Creed, Thomas. (California State Coll., Long Beach) *Successive reversals of a visual social stimulus*. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 282-285. —Describes an experiment with 2 male squirrel monkeys in which high and near-zero rates of response of 1 S were successively reversed as the occasion for reinforcement and nonreinforcement of the other S. Both rates of response were discriminated by the 2nd S. The acquisition of the alternating discriminations in the sequence of reversals was much more rapid than the earlier discriminations. Results indicate that a wide range of rates of response may serve as social stimuli and that the learning-set (learning-to-learn) phenomenon appears to be relevant to social as well as nonsocial episodes. —*Journal abstract.*

8571. Freeman, N. H. (U. Durham, England) *Spatial variation as a conventional cue*. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 262. —Distance-discrimination studies confound the attentional response with the effective response by varying the length of the path to food. However, it is possible to use spatial variation exactly like a conventional cue by varying the length of the path to the choice point. In 2 experiments with 14 and 16 female hooded rats, 120 trials were sufficient to obtain evidence of discrimination between 4- and 13-in cues. —*Journal abstract.*

8572. Hunter, Maxwell W. & Kamil, Alan C. (Massachusetts) *Object-discrimination learning set and hypothesis behavior in the northern bluejay (Cyanocitta cristata)*. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 271-273. —4 northern bluejays received 700 trials of object-discrimination learning set. Acquisition of the task was shown by an average performance level of 72% correct for Trial 2 on the last 100 problems of the experiment. This figure is superior to asymptotic Trial 2 levels for many subprimate mammalian species and comparable to the marmoset. Analysis of data for "hypothesis behavior" reveals several important features of the Ss' responding, many of potential comparative significance. In particular, (a) consistent decreases in responding due to stimulus preferences and 3rd trial responding, (b) a dramatic drop in random responding, and (c) steady increases in win-stay/lose-shift-object (maximum strategy) coincided with increasing proficiency. —*Journal abstract.*

8573. Mackintosh, N. J. & Cauty, Ann. (Dalhousie U., Halifax, Nova Scotia, Canada) *Spatial reversal learning in rats, pigeons, and goldfish*. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 281-282. —Trained 4 male hooded rats, 4 White Carneaux pigeons, and 4 goldfish under comparable conditions for 40 trials daily on a spatial discrimination and a series of 30 daily

reversals. All 3 groups showed a significant reduction in errors/reversal over the course of the experiment, but the rats improved much more rapidly than the pigeons, who in turn improved more rapidly than the goldfish. —*Journal abstract.*

8574. Malone, John C. (Duke U.) **Properties of the fixed-interval S^o .** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 57-59.—Administered 3 generalization tests with novel stimuli to 4 experienced White Carneaux pigeons after fixed-interval (FI) training. In all cases, responding increased during test intervals, but the amount of elevation varied among tests. Results support an analogy between FI and Pavlovian delayed conditioning, although Pavlov's simple interpretation of the latter remains open to question. —*Journal abstract.*

8575. Means, Larry W., Hardy, William T., Gabriel, Michael, & Uphold, John D. (East Carolina U.) **Utilization of odor trails by rats in maze learning.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 160-164.—Conducted 3 experiments with a total of 62 male and 14 female Long-Evans rats to examine the adequacy of odor trails of rats receiving reinforcement as cues for discrimination learning in a T maze. After considerable training, Ss learned to select the arm entered by a previously reinforced S at better than chance levels when a paper floor was used and changed between each pair of Ss. A permanent wooden floor failed to produce any evidence of learning. If the number of Ss providing the odor trail was increased from 1-6, Ss showed improved discrimination performance after 105 trials on wooden floors. It is concluded that the odor trails of previously reinforced rats provide a weak cue, but one sufficient to influence discrimination performance. (21 ref.) —*Journal abstract.*

8576. Tribhawan, T., Rucker, W. B., & McDiarmid, C. G. (U. Nebraska) **Demonstration of a Kamin-like effect after appetitive training.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 41-42.—Trained 40 male WF/MAI rats for 18 trials in a 3-choice discrimination apparatus with responses to the dark stimulus rewarded by food. After an interval of 5 min., 1, 4, 8, or 24 hr., Ss were given 18 trials of training with the discrimination reversed, the light stimulus becoming the rewarded cue. Memory of the original training, as indicated by errors made on the reversed discrimination (adjusted by analysis of covariance) was a U shaped function of intersession interval. Reversal learning of Ss tested 4 hr. after original training showed the least interference. Results are consistent with concepts of successive phases of memory but are inconsistent with explanations of the I. Kamin (see PA, Vol. 33:3155) effect based on incubation of fear. —*Journal abstract.*

8577. Waller, T. Gary. (U. Waterloo, Ontario, Canada) **The effect of overtraining on two extradimensional shifts in rats.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 123-124.—Trained 32 male naive albino Holtzman rats to criterion or beyond criterion on an orientation discrimination task (left vs. right oblique stripes). Ss were then given an extradimensional shift to a discrimination between 2-tradimensional shapes (cross vs. triangle) or between large and small checkerboard patterns. Position of the positive cue (left or right) was the only variable irrelevant dimension in either phase of the experiment. Overtraining on the orientation discrimination improved performance on both transfer problems. —*Journal abstract.*

8578. Wildemann, Donald G. & Holland, James G. (U. Pittsburgh) **The effects of delay and difficulty on discrimination learning and stimulus generalization.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 307-308.—Following training on an easy size discrimination, 6 adult naive White Carneaux pigeons were matched on the basis of stimulus control by the positive stimulus following generalization tests. 3 Ss were immediately retrained on a more difficult discrimination along the same dimension, while the remaining Ss were retrained after a 6-mo delay. The 6-mo-delay group took longer to learn the more difficult discrimination and displayed less stimulus control on a subsequent generalization test. —*Journal abstract.*

8579. Williams, John T. & Robertson, Sam G. (U. South Carolina) **Brightness discrimination learning in caimans.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 259-262.—Trained 12 caimans to escape shock in a T maze with either brightness cues or confounded brightness and spatial cues relevant. After criterion was reached on the confounded problem, the position of the brightness cues were then varied for these Ss with position becoming an irrelevant cue and the color of the positive cue unchanged. Although the confounded problem was learned more quickly than the brightness problem, there was no statistically reliable difference in the overall training required to learn the brightness problem regardless of prior training on the confounded task. —*Journal abstract.*

8580. Zentall, Thomas; Collins, Norman, & Hearst, Elliot. (U. Pittsburgh) **Generalization gradients around a formerly positive S^- .** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 253-259.—After mastering a successive discrimination between a blank key (S^+) and a vertical line (S^-), 8 experimentally naive female White Carneaux pigeons in 2 groups were tested for line tilt generalization in extinction. The vertical line had always been associated with nonreinforcement of keypecking in 1 group, but for the other group it had served earlier as a stimulus associated with reinforcement. As Ss in both groups yielded gradients with a minimum at the S^- value, but the latter group made appreciably more responses during testing. Further generalization tests, conducted with reinforcement at all line-tilt values, suggested other differences between the groups. —*Journal abstract.*

Avoidance & Escape

8581. Doolittle, John H. (Sacramento State Coll.) **The effect of thigmotaxis on negative phototaxis in the earthworm.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 311-312.—Measured the negative phototaxis (right avoidance) responses of 20 earthworms under 2 thigmotactic (bodily contact) conditions: presence or absence of an alley. As predicted by A. C. Smith, the absence of an alley greatly increased the time taken by Ss to move away from a light source. It is concluded that thigmotaxis is a powerful motivational variable in the earthworm. —*Journal abstract.*

8582. Hussey, Frederick A. (Brandon U.) **Avoidance learning in the golden hamster. The effect of CS-US interval.** *Psychonomic Science*, 1971(Apr), Vol. 24(A), 5-7.—Investigated the influence of the interstimulus interval (ISI) on shuttlebox avoidance learning in the male golden hamster. 5 groups of 10 Ss learned a barrier-jumping response under a delayed conditioning

the other 3 species. Results indicate that species-specific defense reactions may interact with the particular behavioral task in which the organism is studied.—*Journal abstract.*

8592. Wilcoxon, Hardy C., Dragoin, William B., & Kral, Paul A. (George Peabody Coll. for Teachers) **Illness-induced aversions in rat and quail: Relative salience of visual and gustatory cues.** *Science*, 1971(Feb), Vol. 171(3973), 826-828.—Describes 2 experiments with 40 male Sprague-Dawley rats and 40 adult male bobwhite quail. Results indicate that the quail, like the rat, learned in 1 trial to avoid flavored water when illness was induced by a drug $\frac{1}{2}$ hr. after drinking. In contrast to the rat, however, quail also learned to avoid water that was merely darkened by vegetable dye. The visual cue was even more salient than the taste cue in quail.—*Journal abstract.*

Reinforcement

8593. Capaldi, Elizabeth D. (Purdue U.) **Rewarded goal-box placements and subsequent instrumental performance in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 152-159.—Studied the effect of direct placements over the goal cup followed by orthodox running trials in the alley. In Exp. I with 60 Holtzman male albino rats, following placements, 45 running trials were given to a reward of .99 or .09 gm., followed by 30 trials of .09 gm., followed by 21 trials of .99 gm. In Exp. II with 40 Holtzman female albino rats, following placements, 63 running trials were given to a reward of .09 gm. followed by 10 extinction trials. In both experiments the effects of placements were manifest throughout all subsequent running trials. Results suggest that on placement trials an instrumental reaction was made and that subsequent instrumental performance was facilitated by large-reward and inhibited by small-reward placements. (21 ref.)—*Journal abstract.*

8594. Coulson, G. E., Koffer, K. B., & Coulson, V. (York U., Toronto, Ontario, Canada) **Reinforcement of ethanol consumption in rats by an increase in the frequency of food-pellet delivery.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 103-104.—Increased the frequency of food-pellet delivery to 4 male Sprague-Dawley food-deprived rats, contingent upon drinking either distilled water or a 9% (volume for volume) ethanol solution. In spite of the contingency of a minimum interval of 3 sec. between drinking the reinforced liquid and pellet delivery, an increase in the frequency of pellet delivery from 1/120 sec. to $\frac{1}{15}$ sec. on the average acted as a positive reinforcer for drinking that liquid associated with the greater pellet frequency.—*Journal abstract.*

8595. Hammer, Lois R. (George Washington U.) **Reinforcement magnitude effects with overtraining.** *Psychonomic Sciences*, 1971(Mar), Vol. 22(5), 295-297.—Repeated a standard runway experiment on shifts in reinforcement magnitude, but with a much more extended acquisition phase. Ss were 8 male Sprague-Dawley albino rats assigned to 1 of 2 groups receiving either large or small reward. After 50 trials, the groups did not differ. Subsequent increase or decrease in reward did not change running times appreciably. Because much competing behavior was observed in this situation, the appropriateness of runway measures is questioned. (16 ref.)—*Journal abstract.*

8596. Harrison, J. M., Downey, P., Segal, M., & Howe, M. (Cambridge U., Psychological Lab., England) **Control of responding by location of auditory stimuli: Rapid acquisition in monkey and rat.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 379-386.—Attempted to determine the conditions necessary for rapid acquisition of control of responding by location of noise and tone bursts in the monkey. 4 adult naive squirrel monkeys were run in an enclosure that contained 4 loudspeakers and 4 manipulanda. 2 conditions were used in training. In the adjacent condition, a stimulus (noise or tone burst) was presented through 1 of 2 speakers and a response on the manipulandum remote from the speaker was reinforced with food. In the nonadjacent condition, a stimulus was presented through 1 of 2 speakers, and a response on a manipulandum remote from the speaker was reinforced with food. Acquisition of control was measured by change in the percentage of reinforced responses during training. In the adjacent condition, responding came under control of location within 0-3 sessions. In nonadjacent conditions, Ss required 14-20 sessions to come under control of location. These latter numbers are comparable to those reported in the literature for localization discrimination in monkeys.—*Journal abstract.*

8597. Hughes, Ronald G. (U. North Carolina, Greensboro) **Response-reinforcement interactions in multiple interval schedules.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 305-306.—2 adult Silver King pigeons were initially exposed to multiple variable-interval (VI) schedules of reinforcement. After responding was maintained, a limited-hold requirement was added to 1 component. Each scheduled availability of reinforcement terminated if no response occurred within a 1-sec period of time. Response rate increased and reinforcement rate decreased in the limited-hold component. Response rate in the unchanged VI component increased. When responding was extinguished in the changed component, positive behavioral contrast was observed in the unchanged VI component.—*Journal abstract.*

8598. McCain, Garvin; Dyleski, Kenneth, & McElvain, Gerald. (U. Texas, Arlington) **Reward magnitude and instrumental responses: Consistent reward.** *Psychonomic Monograph Supplements*, 1971, Vol. 3(16), 249-256.—Presents a series of 7 experiments in which 232 male and female Holtzman and Long-Evans rats were run to large or small consistent reward in a straight alley. Terminal acquisition differences were present after limited (24 trials) training and in the early stages of extended training, but there were no significant or substantial differences after 54, 60, 70, 78, 90, 116, or 135 trials. Large-reward groups were less resistant to extinction than small-reward groups after 24-90 trials but not after 116 or 135 trials. Results are contrary to earlier assumptions regarding the effects of reward magnitude. 2 possible approaches to these results are considered. (28 ref.)—*Journal abstract.*

8599. Porter, John J., Madison, Harry I., & Swatek, Alan J. (U. Wisconsin, Milwaukee) **Incentive and frustration effect of direct goal placements.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 314-316.—Studied the effects of rewarded direct goalbox placements (DPs) prior to runway training on 1st-trial acquisition and resistance to extinction. Ss were 106 male Holtzman albino rats in 3 experiments. DPs directly over

the foodcup enhanced 1st-trial performance, but did not produce an overlearning-extinction effect (OLE). DPs requiring running to the foodcup produced the OLE but also reversed the 1st-trial results. Results are discussed in terms of K. W. Spence's conception of the role of fractional anticipatory goal response in incentive and frustration.—*Journal abstract.*

8600. Traupmann, Kenneth; Wong, Paul T., & McCain, Garvin. (U. Texas) **Reward magnitude and instrumental responses: A comment.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 13-15. Presents criticisms of the studies of G. McCain (see PA, Vol. 44:16241) which found that reward magnitude effects disappeared with extended training. It is maintained that statistical shortcomings and lack of control for such variables as drive level, sex, weight of Ss, and performance within days account for the results. A reply by G. McCain (a) defends the appropriateness of the statistical methods, (b) argues that all magnitude studies are potentially confounded by uncontrolled variables, and (c) restates his conviction that "under some conditions differences due to reward magnitude disappear at asymptote."—S. Knapp.

Reinforcement Schedule

8601. Alleman, Harold D. (U. Iowa) **Interresponse-time reinforcement.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5650.

8602. Arnold, John E., & Shanab, Mitri E. (U. California, Santa Barbara) **The effect of long N-ITR intervals upon the PRE.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 263-264.—42 naive male albino Sprague-Dawley rats in 6 groups were given 1 trial/day for 19 days in a straight runway according to a 3×2 design. Schedule of reinforcement was varied in 3 ways: (a) partial reinforcement with intertrial reinforcement (ITR) after nonrewarded trials, which preceded rewarded (R) trials; (b) partial reinforcement with ITR following selected R trials; and (c) consistent reinforcement with ITR given according to 1 or the other of the above ITR schedules. The administration of ITR occurred either 2 or 24 hr. after 4 designated trials. Results of 24 extinction trials do not support predictions based on the view that the aftereffects of nonreward remain readily replaceable over long periods of time.—*Journal abstract.*

8603. Contrucci, Joyce J., Hothersall, David, & Wickens, Delos D. (Ohio State U.) **The effects of a novel stimulus introduced into a DRL schedule at two temporal placements.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 97-99.—Introduced a potentially disinhibiting novel stimulus early or late into a 20-sec DRL interval after 18 Sprague-Dawley rats had attained criterion performance on this schedule. Evidence was found for disinhibition, the inhibition of inhibition, of the leverpressing response. The effect decreased over stimulus presentations within any 1 test session and likewise decreased over test days. Results support a traditional interpretation of inhibition and the disinhibition phenomenon rather than a mediating response explanation.—*Journal abstract.*

8604. Haney, R. R., Bedford, John A., & Berryman, Robert. (U. Mississippi) **Schedule control in the White-Necked raven, *Corvus cryptoleucus*.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 104-105.—5 White-Necked ravens were run to behavioral stability on

each of 3 moderate schedules of positive reinforcement: (a) fixed-ratio 50, (b) fixed-interval 4 min., and random-interval 2.5 min. The sequence of schedule exposure for any 1 S was different from that for any other S. Temporal variations in rates emitted by Ss under these schedules were characteristic of those emitted by other species more typically used in operant conditioning studies.—*Journal abstract.*

8605. Keehn, J. D., & Colotla, V. A. (York U. Toronto, Ontario, Canada) **Schedule-induced drinking as a function of interpellet interval.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 69-71.—Reinforced 2 male albino rats with 45-mg Noyes pellets on fixed-interval (FI) schedules from 15 sec. to 5 min. Ss exhibited a bitonic relationship between level of polydipsia and interval value. This relationship depended on the frequency distribution, and duration of drinking. At shorter FI drinks occurred frequently shortly after reinforcement and drink durations and frequencies varied directly with interval length. At longer intervals, drinking seldom occurred after reinforcement but was more frequent later in the interval. Late drinks were usually brief.—*Journal abstract.*

8606. Marx, Melvin H., & McLean, Jim. (U. Missouri) **Postdiscrimination gradients as a function of variation in reward schedules.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 55-56.—Trained 6 male White Carneaux pigeons on discrimination of wavelength stimuli and tested for postdiscrimination generalization gradients. 3 Ss were trained on multiple fixed-interval (FI) 30-sec (.50 reinforcements) extinction and 3 on variable-interval (VI) 60-sec as a control. No peak shifts were found in the FI-trained Ss, and the VI-trained Ss failed to show consistent peak shifts. Results suggest that the number of S+ days provided prior to discrimination training may be an effective variable in the production of peak shift.—*Journal abstract.*

8607. Rosen, Alexander J., & Freedman, P. E. (U. Illinois, Chicago) **Goal-box experience and partial reinforcement runway effects in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 145-151.—Conducted 2 experiments with 30 and 48 Holtzman male albino rats. Independent variable manipulations included: (a) number of tube licks of sucrose reward/trial in continuous, partial, and varied reinforcement conditions; and (b) time in the goal box on nonreinforced trials for food-pellet partial reward conditions. Results appear to support a frustration hypothesis competing response interpretation of runway PRE.—*Journal abstract.*

8608. Shull, Richard L. (U. North Carolina, Greensboro) **Postreinforcement pause duration on fixed-interval and fixed-time schedules of food reinforcement.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 77-78.—Studied 3 adult male Silver King pigeons under 3 different schedules that arranged equivalent constant minimum-time intervals between food presentations. Schedules were (a) a fixed-interval schedule, where reinforcement depended on a response after 2 min. had elapsed; (b) a conjunctive fixed-time schedule, where reinforcement depended on a response after an elapsed 2-min interval and a response without regard to order; and (c) a fixed-time schedule, where food was presented every 2 min. without regard to S's responding. Response rates were much lower under Schedules b and c than under a. Postreinforcement pauses were about equal under all 3 conditions, provided the duration of the

postreinforcement pause for Schedule c was based only on intervals containing at least 1 response.—*Journal abstract.*

8609. Snapper, Arthur G., Shimoff, Elliot H., & Schoenfeld, William N. (FDR Veterans Administration Hosp., Montrose, N.Y.) **Response effects of response-dependent and clock-dependent fixed-interval schedules of reinforcement.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 65-67.—Trained each of 2 groups of 16 male Charles River CD rats under fixed-interval schedules of positive reinforcement. 1 schedule was programmed "by the response," in that each 3-min interval was timed from the end of the preceding reinforcement. The other schedule was programmed "by the clock," with periods of reinforcement availability occurring every 3 min. after the start of the session. Comparisons of response rate and temporal discrimination revealed no significant differences in performance under the 2 procedures. Rank-order correlations were found to be significant between 2 measures of temporal discrimination, but there was no significant correlation between response rate and temporal discrimination across Ss.—*Journal abstract.*

8611. Trubachëv, V. V. (Inst. of Experimental Medicine, Leningrad, USSR) **Vliyaniye veroyatnostnogo podkrepleniya na dinamiku oboronitel'nykh uslovnykh refleksov u krolkov.** [Influence of probabilistic reinforcement on the dynamics of defensive conditioned reflexes in rabbits.] *Zhurnal Vysshei Nervnoi Deyatelnosti*, 1970(Sep), Vol. 20(5), 917-922. —16 rabbits (8 subjected to partial reinforcement, 8 to 100%) were used to study the formation and extinction of motor-defensive CRs to tactile stimulation of the rear thigh, following a schedule of electroreinforcement 50% of the time (both stereotypic and random). Defensive CRs were formed with both kinds of partial reinforcement. A comparison of several indices of the general motor and the specialized CR, involving its appearance and the stabilization, revealed differences in the 2 groups. In stabilization, revealed differences in the 2 groups. In random 50% reinforcement, the appearance and initial stabilization of the general motor CR proceeded as fast as in the case of 100% reinforcement; however, final stabilization took place later. The specialized CR was finally stabilized much later. In the process of elaborating the reflex with 50% reinforcement, there were disclosed both a differentiation between reinforced and unreinforced stimuli and an effect of "maximization," i.e. CRs running 20-30% beyond the expected 50%. Extinction of CRs after partial reinforcement was characterized by a high incidence of restoration in the 1st experiments as compared to the case with 100% reinforcement. (English summary)—*J. D. London.*

Punishment & Extinction

8612. Beecroft, Robert S. (U. North Dakota) **Patterns in avoidance extinction.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 53-55. —Analyzed avoidance extinction in 60 female hooded rats by classifying running times as fast, medium, or slow. The contingent probabilities of runs of various speed or extinction on the following trial were determined. The most probable transitions were to runs of the same speed class.

Extinction was much more probable following slow runs than after medium or fast runs. Increasing the amount of avoidance training contributed to resistance to extinction by lengthening the sequence of fast runs at the beginning of extinction.—*Journal abstract.*

8613. Bilková, J. & Radil-Welsh, T. (Czechoslovak Academy of Sciences, Lab. of Neurocybernetics, Prague) **The extinction of a certain type of avoidance reaction in rats.** *Physiologia Bohemoslovaca*, 1969, Vol. 18(5-6), 463-467.—Elaborated avoidance CRs in 15 male hooded rats. The avoidance CR consisted of jumping to a safe platform within 5 sec. after the start of the stimulus. The CS was the insertion of a safe platform and blinking lights. The UCS consisted of electric shocks to the paws. The reflex was elaborated 4 times with subsequent extinction by applying the CS without the UCS. Stimuli were applied at 60-sec intervals. The rate of extinction and the duration of the latent periods were determined in 3 situations: (a) stimuli repeated every min., (b) alternative application and omission of stimuli for 10 min. each, and (c) alternative application and omission of stimuli at 5-min intervals. The rate of extinction for a and b was approximately 47 min., while in c extinction occurred after only 34 min. The latent periods were gradually prolonged during extinction. A significant negative correlation was found between the rate of extinction and the average duration of latent periods. After the omission of several stimuli the latent period of the 1st subsequent reaction was prolonged.—*Journal summary.*

8614. Bitgood, Stephen C. & Platt, John R. (U. Iowa) **A discrete-trials PREE in an operant situation.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 17-19.—Assigned 3 groups of 8 male homing pigeons to different ratio schedules of reinforcement during acquisition and extinction training with a discrete-trials operant procedure. A group with all trials reinforced was less resistant than a 50% reinforcement group. Any increments in resistance to extinction due to variations in number of responses (and presentation) were demonstrated to be inadequate to explain this discrete-trials partial-reinforcement extinction effect. It is concluded that discrete-trials resistance to extinction is more sensitive to acquisition variations in reinforcement trial than in reinforcement response.—*Journal abstract.*

8615. Boyer, William S., Russin, Raymond, & Cima, Henry A. (Colorado State U.) **Extinction in a straight alley as a function of varied quality and quantity of reward sequence.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 92-93.—Extinguished 6 groups of 11 albino rats in a straight alley after receiving 2 trials each on 1 of the following varied quality and/or quantity of reward sequences: (a) 1 regular pellet followed by 1 regular pellet, (b) 1 regular pellet followed by 1 regular pellet, (c) 1 regular pellet followed by 16 sucrose pellets, (d) 1 sucrose pellet followed by 16 sucrose pellets, and (e) 16 sucrose pellets followed by 16 sucrose pellets. Evidence was found for an extension of the sequential hypothesis to include quality of reward: greater resistance to extinction occurred when a high-quality reward followed a low-quality reward than when the opposite sequence occurred. Variations in both quantity and quality of reward produced more resistance to extinction than variations in quantity of reward alone.—*Journal abstract.*

8616. Cicala, George A. & Ilm, Ronald R. (U. Delaware) **The effects of prefeed conditioning shock**

intensity on initial shuttle response rate. *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 67-68.—Investigated the effects of prelear conditioning shock intensity on unreinforced shuttle response rate, using 63 male Wistar rats. Results indicate that unreinforced shuttle response was inversely related to prelear shock intensity. The CS enhanced shuttling equally for all prelear shock groups. Data suggest that prelear conditioning decreases initial shuttle response rate, while the CS partially reverses this effect. An interpretation of demonstrated facilitation by prelear conditioning is offered. *Journal abstract.*

8617. Gerry, J. E. (Dalhousie U., Halifax, Nova Scotia, Canada). **Peak shift on the tonal-frequency continuum: The effects of extinction and punishment.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 33-34.—Attempted to extend the generality of the peak shift phenomenon to the tonal-frequency dimension. 2 naive White Carneaux pigeons were given extended intradimensional discrimination training on the tonal-frequency dimension. Both Ss displayed peak shifts early in discrimination training and loss or reduction of peak shift after more extended training. Introduction of response-contingent shock after each response to the S appeared sufficient to either yield marked recovery of peak shifts or increase the magnitude of existent peak shift. Results complement those obtained on color and line orientation. *Journal abstract.*

8618. Marx, Melvin H., & Witter, David W. (U. Missouri). **Differential resistance to extinction as a function of fixed-interval contrast in training.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 285-286.—Employed differential fixed interval (FI) schedules to test the previously advanced motivational theory of extinction, which predicts positive or negative contrast effects in extinction as a function of acquisition experience, in an experiment with 40 naive female hooded Long-Evans rats. Ss trained on both FI 10- and 40-sec schedules of bar presentation and extinguished on FI 10 sec (all within a discrete-trial experimental design) were significantly more resistant to extinction than were controls both trained and extinguished on FI 10 sec. However, Ss receiving mixed training and extinguished on FI 40 sec, were significantly less resistant to extinction than were controls trained and extinguished on FI 40 sec. Findings are interpreted as lending additional support to the motivational theory of extinction. *Journal abstract.*

8619. Patten, Richard L., & Hendricks, Reginald L. (Iowa State U.). **Primary stimulus generalization effect in latent extinction of latent acquisition.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 75-76.—Assigned male Wistar rats to 2 groups receiving latent acquisition training placements to reward in the goalbox of a straight runway. 18 Ss received latent extinction training placements to nonreward in either the runway goalbox or a distinctive goalbox. 18 controls received either latent acquisition training only or neither type of training. Running speed data from a single test trial provided evidence for the operation of primary stimulus generalization in producing latent acquisition and latent extinction effects. *Journal abstract.*

8620. Tedford, W. H., & Leibensperger, Patricia K. (Southern Methodist U.). **Immediate vs delayed shock on a spatial dimension.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 83-84.—Compared preferences for short, medium, or long spatial delays of shock, using 36 female Sprague-Dawley albino rats. Significant

preferences were found (a) for long over either short or medium delay, and (b) for short over medium delay. Results are interpreted in terms of the ambiguity of the choice situation when punishment is absolutely certain. Ss prefer to have it immediately; when there is some ambiguity present, delayed punishment is selected. *Journal abstract.*

8621. Treichler, F. Robert; Graham, Marilyn M., & Schweikert, G. Edward. (Kent State U.). **Social facilitation of the rat's responding in extinction.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 291-293.—Compared the extinction performances of a total of 168 adult male Hanover albino rats in several experiments when provided either individual or paired conditions during operant acquisition and/or extinction. Enhanced resistance to extinction was observed when Ss were trained alone and subsequently extinguished in pairs. All other combinations of conditions yielded lower and non-differential levels of responding during testing. This pattern of results did not appear specific to condition-dependent changes in the nature of stimuli associated with reinforcement. It is suggested that results could be attributed to a limited-term arousal effect of social pairing. *Journal abstract.*

SOCIAL & SEXUAL BEHAVIOR

8622. Avis, Harry H., & Treadway, Jerry T. (Edgewood Arsenal Research Lab., Md.). **Mediation of rat-mouse interspecific aggression by cage odor.** *Psychonomic Science*, 1971(Mar), Vol. 22(5), 293-294.—Placed 10 hooded male Wistar killer rats in each of 4 cage conditions: home cage, rat-soiled cage, neutral cage and mouse-soiled cage. Latencies to attack and kill were measured when male ICB Swiss mice were placed with Ss. It was found that the mouse-soiled condition was most effective in increasing latency to kill and reducing the number of killing responses. *Journal abstract.*

8623. Barlow, George W. (U. California, Museum of Vertebrate Zoology, Berkeley). **A test of appeasement and arousal hypotheses of courtship behavior in a cichlid fish, *Etilophus maculatus*.** *Zeitschrift für Tierpsychologie*, 1971(Oct), Vol. 27(7), 779-806.—Tested 2 hypotheses about courtship behavior: (a) appeasement, equivalent to potential for attack, quivering (amount of courtship) should be positively correlated with relative size of mate, and (b) arousal, courtship should be maximal for the male when he is large and for the female when she is small. A "rover" was exposed to 6 cichlids in glass chambers, all were of either sex. In heterosexual interactions quivering by the chamber males conformed to the arousal hypothesis. Chamber and rover females appeared to follow the appeasement model. Males quivered more than females. Females and rover males tended to attack more when relatively large, but chamber males may have attacked more when relatively small. Rover males, essentially intruders, quivered as the appeasement hypothesis predicted. Females commonly formed homosexual pairs and even threesomes. Females evoked more courtship from males and from females than did males. If females were about equal in size, and in a group, they could overcome the aggressive behavior typical of isosexual interactions. Males were not as "sexy" as females, and were more aggressive among themselves than were females; they did not form homosexual pairs. (20 ref.)—*Journal abstract.*

8624. Birch, Martin. (Dysons Perrins Lab., Oxford, England) **Pre-courtship use of abdominal brushes by the nocturnal moth, *Phlogophora meticulosa* (L.) (Lepidoptera: Noctuidae).** *Animal Behaviour*, 1970(May), Vol. 18(2), 310-316.—A high percentage of male nocturnal lepidoptera possess glandular eversible organs. 30% of British Noctuidae have a complex brush organ producing a pheromone. Release of the female sex attractant at a specific time prompts the male to fly upwind, locate the female, and to evert the brushes just before attempting to copulate. Intact males usually succeed, but those without brushes do not. The male gland discharges only once and the pheromone is then stored on the brushes in sufficient quantity for up to 3 matings. Male eversible glandular organs in other families appear to have the same species-isolating function, with some exceptions.—*Journal summary*.

8625. Brady, U. Eugene; Tumlinson, James H., Brownlee, Robert G., & Silverstein, Robert M. (U. Georgia) **Sex stimulant and attractant in the Indian meal moth and in the almond moth.** *Science*, 1971(Feb), Vol. 171(3973), 802-804.—Isolated cis-9, trans-12-tetradecadien-1-yl acetate from the female Indian meal moth, *Plodia interpunctella* (Hübner), and the female almond moth, *Cadra cautella* (Walker). It is the major if not the sole component of the sex stimulatory and attractant pheromone of female *Plodia*, and is present in the pheromone of the female *Cadra* along with at least 1 synergist. The distinction between the bioassays for sexual stimulatory response and for attraction is emphasized.—*Journal abstract*.

8626. Compton, J. M. & Scott, J. P. (Bowling Green State U., Center for Research on Social Behavior) **Allelomimetic behavior system: Distress vocalization and social facilitation of feeding in telomian dogs.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 165-179.—Food consumption and distress vocalization were measured for 11 5-wk-old telomian dogs twice daily for 16 days. All Ss were tested alone and together each day in the same pen. The kind of pen (home or strange) was alternated each day. Highly significant differences ($p < .001$) for both food consumption and distress vocalization occurred between alone and together conditions. Ss ate more when together and emitted more distress vocalizations when alone. Differences between home and strange pen conditions were apparent in both food consumption and vocalization only at the outset of the experiment, indicating rapid familiarization. However, there was a strong inverse relationship between rankings in separation distress and food consumption, indicating that isolation inhibition as well as social facilitation may contribute to differences in the alone vs. together conditions. (22 ref.)—*Author abstract*.

8627. Dewsbury, Donald A. (U. Florida) **Copulatory behaviour of rice rats (*Oryzomys palustris*).** *Animal Behaviour*, 1970(May), Vol. 18(2), 266-275.—Studied the copulatory patterns of rice rats in 69 tests, each continued to a satiety criterion of $\frac{1}{2}$ hr. without an intromission. Females were in hormone-induced estrus. The basic motor patterns resembled those of laboratory rats but were less exaggerated. There was a low ejaculation frequency with all tests terminating in fewer than 4 complete series. Copulation was resumed with a change of female. The 2nd series was faster than the 1st or the 3rd as it contained fewer intromissions. Pursuit of the female by the male during the postejaculatory interval was in contrast to all other species given

systematic study. Female resistance played an important role in the termination of copulation. (17 ref.)—*Journal summary*.

8628. Gallup, Gordon G. & Hess, John Y. (Tulane U.) **Preference for mirror image stimulation in goldfish (*Carassius auratus*).** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 63-64.—Presented a continuous choice between orienting toward a mirror or another conspecific behind plexiglas to 10 goldfish. Ss exhibited a distinct preference for mirror-image stimulation. The ratio of time spent in association with the mirror plus a target fish to time in the neutral zone showed a tendency to increase as a function of the amount of social deprivation imposed prior to testing. Implications for theories that attribute the appetitive properties of mirror confrontation to the fact that it elicits an aggressive display are discussed.—*Journal abstract*.

8629. Johnson, Robert P., Sachs, Carl A., & Boitano, John J. (Fairfield U.) **The primacy of size-age dimension over familial relationships in shock-elicited aggression in rats.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 71-72.—Tested 42 34-47 day old Sprague-Dawley albino rats in a shock-elicited fighting situation. Ss exhibited significantly more attacks when paired with a littermate as compared with a natural or a surrogate mother. Attack suppression occurred during the initial test sessions only for the natural mother paired with her young when contrasted with the number of encounters between the young and the surrogate mother.—*Journal abstract*.

8630. King, Edith G. (U. Oklahoma) **Social organization in captive chimpanzees: The effects of number of individuals, space, and coalitions upon the dominance hierarchy.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6159.

8631. Latané, Bibb; Schneider, Emily; Waring, Peter, & Zweigenhaft, Richard. (Ohio State U.) **The specificity of social attraction in rats.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 28-29. Conducted 2 experiments with naive Sprague-Dawley rats on social attraction. In Exp. I, 54 male Ss, housed alone or in pairs, were tested daily with either the same partner or with a stranger. All Ss were highly and increasingly attracted to each other, but were not more attracted to familiar rats than to strangers. Isolated Ss became more gregarious than pair-housed Ss by the 4th day of testing. In Exp. II, 36 female Ss, tested in trios with a stranger and a cagemate, again showed no preference. Results indicate that rats do not develop specific attachments.—*Journal abstract*.

8632. Rivero, William T. (Louisiana State U.) **Survival stamina as a function of social interaction.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 20. Examined the possible effects of social facilitation upon survival stamina of 49 male albino Long-Evans rats running on a motorized treadmill. A 2-tailed t test indicates that paired Ss ran significantly ($p < .05$) longer than did single Ss. Results suggest that as a result of social facilitation, animal pairs exhibited greater survival stamina than single animals. *Journal abstract*.

8633. Rosenblum, Leonard A. & Lowe, Arthur. (State U. New York, Downstate Medical Center, Brooklyn) **The influence of familiarity during rearing on subsequent partner preferences in squirrel monkeys.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 35. Placed together 15 laboratory-born adolescent squirrel monkeys, drawn from 4 separate rearing groups

of S, 4, 4, and 2 Ss. Strong consistent preferences for interacting with others of the same rearing group were observed in 6 wk. of initial observation and persisted in follow-up observations 14 mo. later. Play was the major type of interaction between strangers and may serve as the primary mechanism through which social integration occurs.—*Journal abstract.*

SENSORY PROCESSES

8634 Bagdonas, A., Bel'kovich, V. M., & Krushinskaya, N. L. (Inst. of Developmental Biology, Moscow, USSR) *Vzaimodelstvie analizatorov u del'fina-belobochki pri razlichenii geometricheskikh figur pod vodoi.* [Interaction of the analyzers in the white-sided dolphin in discrimination of geometric figures under water.] *Zhurnal Vysshego Nervnogo Razvitiia*, 1970(Sep), Vol. 20(5), 1070-1075. Utilizing motor-alimentary CRs a dolphin (*Delphinus delphis*) learned underwater differentiation of geometric figures (square, triangle) discriminated by recourse to their optic and acoustic properties and presented under various conditions of visibility. Under conditions inadequate for use of the echolocational analyzer S employed primarily vision in order to discriminate figures. Under conditions limiting visual discrimination the echolocational analyzer was relied on. Under poor visual conditions, correct responses were 10-20% lower than under good visual conditions. Spatial orientation under water, it is concluded, is brought about in the dolphin through the close interaction of the visual and auditory analyzers. (English summary) *J. D. London*

8635 Bartoshuk, L. M., Harned, M. A., & Parks, L. H. (John B. Pierce Foundation Lab., New Haven, Conn.) *Taste of water in the cat: Effects on sucrose preference.* *Science*, 1971(Feb), Vol. 171(3972), 699-701.—Electrophysiological recordings show that water is not tasteless to cats. Also, unlike most mammals cats appear indifferent to sucrose, but this may be because the taste of the sucrose is masked by the taste of the water in which it is dissolved. Results of 2 experiments with 9 adult cats indicate that when water taste was suppressed by the addition of small amounts of sodium chloride, Ss took sucrose avidly (20 ref.) *Journal abstract.*

8636 Campbell, Mary L., & Wachs, Theodore D. (Purdue U.) *Activity level in rats as a function of hyperstimulation and sex of animal.* *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 109-110.—Attempted to define the relationship between hyperstimulation and activity in 20 male and 20 female Holtzman albino rats. 20 Ss were exposed to 30 sec. of intense strobe light before being allowed access to an open field, and 20 controls were not exposed to the strobe light. The procedure was repeated over a 3-day period. Results indicate a significant increase in general activity following hyperstimulation. There were no significant differential sex effects of hyperstimulation. *Journal abstract.*

8639 Dugg, Anne I., & Windsor, Doug E. (U. Guelph, Ontario, Canada) *Olfactory discrimination limits in gerbils.* *Canadian Journal of Zoology*, 1971(Mar), Vol. 49(3), 283-285.—Gerbils were studied because of the complete lack of information on their olfactory ability. They were found to have a "keen sense of smell" even though they come from a dry habitat where olfactory discrimination was theorized to be of less importance than in a more humid climate. Discrimination was better when their bedding was changed daily. Olfactory acuity was suggested as being important to social interactions in the gerbil as well as in the few species of other small mammals that have been studied by other investigators. *J. M. Rafter*

8640 Dellus, Juan D., & Thompson, Gillian. (U. Durham, England) *Brightness dependence of colour preferences in herring gull chicks.* *Zeitschrift für Tierpsychologie*, 1970(Oct), Vol. 27(7), 842-849.—Herring gull chicks chose 1 of 2 stimulus panels illuminated with colored lights. Responses to red panels were hardly affected by intensity differences at all, whereas the responses to green and white light were markedly affected by intensity differences reaching an optimum and then decreasing again. A model is proposed to explain both spectral and intensity preferences. Differential amplification of the photopic modulators generate the spectral response pattern with red and blue maxima and green minimum. By inhibition of the photopic modulators having a higher threshold by the scotopic dominant having a lower threshold the model accounts for the response dependency on intensity differences in connection with green and white light. (22 ref.)—*K. E. Grossmann*

8641 Hamm, Connie L. (Northern Michigan U.) *Exposure learning of auditory stimuli by rats.* *Psychonomic Science*, 1971(Apr), Vol. 23(1-B), 81-82.—Tested 48 Holtzman albino rats for preference for a familiar or a novel tone. 2 experimental groups were exposed to either a solid (S) or a pulsing (P) tone continuously from birth, and later were compared to a control (C) group raised in the absence of tone. Group differences in preference for solid or beeping tone emerged only after a 2-wk silent period. Significantly greater preference for the pulsing tone was shown by Group P over Group C and by Group C over Group S. No difference was obtained between Groups C and P. The confounding effects of a natural preference for intermittent tone are discussed.—*Journal abstract.*

8642 Hein, Alan & Diamond, Rhea M. (Massachusetts Inst. of Technology) *Independence of the cat's scotopic and photopic systems in acquiring control of visually guided behavior.* *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 76(1), 31-38.—Exposed neonatal kittens (Total N = 16) in 3 experiments to scotopic levels of illumination while freely locomoting in an enclosure. Subsequently, visually guided behaviors were displayed at scotopic levels of illumination but were absent at photopic levels. This result is attributed to the fact that visual feedback from movement was restricted to the rod system. It is suggested that the capacity to mediate visually guided behaviors can be acquired independently by scotopic and photopic systems.—*Journal abstract.*

8643 Humphrey, Nicholas. (U. Oxford, Inst. of Experimental Psychology, England) *Colour and brightness preferences in monkeys.* *Nature*, 1971(Feb), Vol. 229(5287), 615-617.—Investigated visual stimuli pref-

ferences of 4 male rhesus monkeys. Ss were placed in testing chambers (painted black on the interior), and visual stimuli were projected on a wall in the chamber. A single response key was positioned above a food pellet tray. Ss were given 15 days of training with irrelevant stimuli to insure familiarization with the experimental situation. Ss were then tested 6 days a wk. For each level of brightness, 2 measurements were made (separated by 2 wk.), and for each color, 3 measurements (separated by 1 wk.) were made. In each session, 2 stimuli were presented which would appear alternately with each key pressing. "To exercise a preference the monkey had simply to hold the key down when he preferred the current stimulus and release and press again when he did not." After a total of 100 sec., a house light came on and the key was inoperative for a 50-sec rest period at which time S received 5 banana pellets. The sequence terminated after 10 cycles, and the total time spent with each stimulus was tabulated. Results show that preferences were consistently stable. Brightness preferences were monotonically related to brightness over the range used, while color was monotonically related to wave length. (20 ref.)—*B. A. Stanton.*

8644. Jaeger, Robert G. & Hailman, Jack P. (U. Maryland) Two types of phototactic behaviour in anuran amphibians. *Nature*, 1971(Mar), Vol. 230(5290), 189-190.—Investigated speculated spectral and brightness preferences in 2 species of frogs. Methods of testing followed criteria suggested by Hailman and experimental apparatus previously used by W. R. Muntz. Ss were placed in a dark apparatus which faced 2 transilluminated screens and were permitted to jump towards either screen (choice). 6 monochromatic stimuli (30 different combinations) and 6 different intensities (all having the same white spectrum) were presented in a randomized sequence to each S. Finally, Ss were tested on paired colors of rank-order intensity. Results show that ranid Ss demonstrated a true preference for high frequencies of light while the leptodactylid Ss demonstrated an inverted curve of spectral sensitivity (violet and red). In the intensity testing, ranid Ss were monotonically photopositive, whereas leptodactylid Ss were monotonically photonegative over the entire intensity range (dark apparatus to unfiltered white light). It was suspected that the ranid spectral response was a true color preference. Additional testing with manipulation of paired variables led to the conclusion that the responses are examples of species differences in phototactic behavior (exemplified by photopositivity to white light with blue color preference and photonegativity to white light without color preference).—*B. A. Stanton.*

8645. Marks, H. E., Seago, J. D., & Remley, N. R. (U. Georgia) The effect of anosmia on taste preference behavior as a function of deprivation conditions. *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 9-11.—In 2 experiments with 21 naive female Holtzman rats, anosmic and normal Ss were compared in a single-bottle preference test. The amount of water, sucrose, saccharin, and quinine solutions consumed was studied. Under food deprivation, anosmic Ss consumed reliably more water and sucrose and less saccharin and quinine than normal Ss; under water deprivation the order of these relationships was reversed.—*Journal abstract.*

8646. O'Connell, R. (San Fernando Valley State Coll.) The response to stimulus change as a brightness scaling technique. *Psychonomic Science*, 1971(Mar), Vol. 22(5), 275-277.—Tested 96 male

Sprague-Dawley albino rats in 8 conditions. Trial 1 exposed S, through plastic plates, to the 2 arms of a T maze, each of a different brightness. Prior to Trial 2, on which choice was permitted, 1 or both arms were changed in brightness. The magnitudes of the proportions of choice of the changed side were not fully consistent with the size of the brightness changes; hence, a scaling analysis was not justified. 1 set of Ss was retested after 4 mo.; the correlation between the conditions on initial test and retest was .90, when entry of an arm with 4 feet was used as the choice measure.—*Journal abstract.*

8647. Schiffman, H. R., Lore, Richard; Passafiume, John, & Neeb, Robert. (Rutgers State U.) Role of vibrissae for depth perception in the rat (*Rattus norvegicus*). *Animal Behaviour*, 1970(May), Vol. 18(2), 290-292.—Investigated the role of the vibrissae in the visual cliff performance of rats. With a moderately low centerboard height. Ss lacking vibrissae showed a marked preference for the optically shallow side of the apparatus. In contrast, intact Ss did not exhibit a preference for either side. Results indicate that tactual cues are prepotent over visual ones for the rat when conflicting information from both sensory modalities is present.—*Journal summary.*

8648. Simmons, James A. (Princeton U., Auditory Research Lab.) Echolocation in bats: Signal processing of echoes for target range. *Science*, 1971(Mar), Vol. 171(3974), 925-928.—In an experiment with echolocating bats (*Eptesicus fuscus* and *Phyllostomus hastatus*) it was found that Ss could discriminate between the nearer and farther of 2 targets. Their errors in discrimination were predicted accurately by the autocorrelation functions of their sonar cries. These bats behave as though they have an ideal sonar system which cross correlates the transmitted cry with the returning echo to extract target-range information. (18 ref.)—*Journal abstract.*

8649. Smith, Ronald G. (Wright State U.) Intake differentiation by rats of equimolar sodium chloride and lithium chloride solutions. *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 11-12. Examined the frequent use of sodium chloride solutions in taste-aversion and bait-shyness experiments as taste equivalents or control solutions for lithium chloride toxin. In 2 experiments with a total of 19 male Sprague-Dawley rats, it was demonstrated that Ss can readily discriminate between .12 M NaCl and equimolar LiCl when both solutions are continuously available in their home cages. Additional work indicates that the learned discrimination was based primarily upon taste cues but that place cues could also be utilized.—*Journal abstract.*

8650. Verberne, Gerda. (Max Planck Inst. of Physiology of Behavior, Starnberg, W. Germany) Beobachtungen un Versuche über das Flehmen katzenartiger Raubtiere. [Observations and experiments on flehmen in various felidae species.] *Zeitschrift für Tierpsychologie*, 1970(Oct), Vol. 27(7), 807-827.—When flehmen occurs, the animal lifts its head to the horizontal or even higher, it opens its jaw and withdraws its lips so that the teeth are exposed, especially the upper teeth. The tongue protrudes until it covers the lower incisors. The usual behavior pattern which more or less regularly accompanies flehmen is sniffing, licking, and head-shaking. All mammal species capable of perhoming flehmen have a still functioning Jacobson's organ. Flehmen and the accompanying behavior pat-

terns most probably serve to facilitate and strengthen stimulation of the sensory cells of this organ. The performance of sniffing and flehmen cannot be exhaustively explained in sensory terms. Since the experimental results do not provide sufficient grounds for a quantitative analysis of the interdependencies, an attempt was made to present the probable functional relationships involved by means of a flow diagram. (24 ref.)—*K. E. Grossmann.*

8651. Ward, Jeannette P. & Doerflein, R. Stephen. (Memphis State U.) **Critical flicker frequency in the bushbaby, *Galago senegalensis*.** *Psychonomic Science*, 1971(Apr), Vol. 23(1-A), 43-45. Investigated the capacity of 4 adult male bushbabies, *Galago senegalensis*, to discriminate intermittent visual stimuli. CFF was estimated at 4 flash intensities by a modified method of limits. The maximum behavioral CFF obtained for this nocturnal prosimian was 27.4 sec. Results are discussed in terms of the retinal structure of galago and are compared to human scotopic CFF. *Journal abstract.*

8652. Williams, Timothy C. & Williams, Janet M. (State U. New York, Buffalo) **Radio tracking of homing and feeding flights of a neotropical bat, *Phyllostomus hastatus*.** *Animal Behaviour*, 1970(May), Vol. 18(2), 302-309. Results indicate that: (a) Flights released from 20 km were accurately directed homeward, those from 30 km less so; bats released at 60 km wandered in all directions. (b) Bats regularly made rapid well oriented flights to and from their feeding areas. No 2 bats followed the same routes during these flights. (c) The same visual orientation systems which allow these bats to return rapidly during homing experiments may also facilitate flight to and from feeding areas. (25 ref.)—*M. Strobel.*

DEVELOPMENTAL PSYCHOLOGY

8653. Aziz, Abdul. (U. Delhi, School of Economics, India) **The legibility of isolated letters of Bengali alphabet.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 96-99.—Investigated the legibility of the Bengali alphabet (an Indian language) using 5 18-25 yr. olds and 5 8-14 yr. olds. Each of the 42 consonants was presented in random order tachistoscopically for 25 trials. The Ward-Wolfwitz Runs Test did not show significant effects of fatigue or practice. Intergroup differences and letter-to-letter differences in legibility are reported.—*K. C. Panda.*

8654. Bevan, William & Steger, Joseph A. (Johns Hopkins U.) **Free recall and abstractness of stimuli.** *Science*, 1971(May), Vol. 172(3983), 597-599.—Studied the relation of abstractness of stimuli to efficiency of free recall in 90 undergraduates and 90 4th graders. Groups were shown a sequence of objects, pictures, and object names and were asked to recall what they had seen. Recall tests were conducted either immediately after presentation of the stimulus-sequence, after 24 hr., or after 1 wk. Objects were recalled more frequently than pictures, and pictures more frequently than words. Adults performed better than children, except in the case of objects.—*Journal abstract.*

8655. FitzPatrick, Alan J. (U. Missouri) **Effects of presentation modes and procedures and grade level on acquisition and retention of paired-associates.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5198.

8656. Grusec, Theodore & Grusec, Joan E. (Toronto, Ontario, Canada) **Information seeking about uncertain but unavoidable outcomes: Effects of probability, valence, and intervening activity.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 177-183. Conducted experiments with 48 6th graders and 64 undergraduates varying (a) pleasant/unpleasant future event, (b) high/low probability of the event, and (c) presence/absence of distracting activities. The future event was indicated in a closed envelope which Ss could open at any time during the E's 20-min absence. Ss opened the envelopes almost immediately, but adult females sought information significantly more quickly than adult males ($p < .05$). Young Ss in the distracting activity-high probability groups delayed longer than those in other conditions. Motivations accounting for the results are suggested.—*S. Knapp.*

8657. Hartup, Willard W. & Yonas, Albert. (U. Minnesota) **Developmental psychology. Annual Review of Psychology**, 1971, Vol. 22, 337-392.—Reviews research in developmental psychology in relation to humans, noting 2 exceptional publications in this field. *Principles of Perceptual Learning and Development* by E. J. Gibson, and *Attachment and Loss* by J. Bowlby. The review includes studies on (a) infancy; (b) perception and cognition; (c) intelligence; (d) language; (e) learning and motivation; and (f) social and personality development. (397 ref.)—*P. Hertzberg.*

8658. Looft, William R. (U. Wisconsin) **Perceptions across the life span of important informational sources for children and adolescents.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 207-211.—Persons of age samples extending across the major portion of the life span were interviewed regarding whom they perceived to be the most important transmitters of information to children and to adolescents. Parents were perceived to be most significant for children, and peers were most significant for adolescents, although the importance of parents for adolescents was also mentioned frequently. Agents perceived to be of somewhat less importance included the mass media, schools and/or teachers, and churches. The late-adolescent/young-adult samples attributed importance to parents less frequently than any other age group.—*Journal summary.*

8659. McCullers, John C. (U. Oklahoma) **Verbal paired-associate learning in children and adults with anticipation, recognition, and recall methods.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 112-117.—Tested 110 6th grade girls and 110 undergraduate women on the same 10-pair list of words under conditions of comparable methodology and procedure in a between-Ss factorial design. Both groups showed the slowest learning with recognition methods due to the manner in which recognition was assessed. Although adults learned faster than children, within-group differences were greater than between-group differences. In terms of speed of learning as well as the distribution of correct responses, omissions, and overt errors, both groups appeared to belong to a common developmental level for this type of task. (16 ref.)—*Journal abstract.*

8660. Murray, John B. (St. John's U., Jamaica, N.Y.) **The generation gap.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 71-80.—G. S. Hall provided the framework for the "generation-gap" problem. In Hall's time, as in the present, authors disagreed whether generation differences were real or only apparent.

Difficulty in answering the question of whether the generation-gap issue is a new problem or only a new label for an old issue was traced to: (a) the many different incidents included under the 1 title, (b) Ss included in descriptions of generation-gap problems vary among themselves, and (c) the varying limits set for generation-gap issues. Several theories advanced to explain the symptoms of the generation-gap issue are described.—*Author abstract.*

8662. Sakabe, N., Arayama, T., & Suzuki, T. (Shinshu U., Faculty of Medicine, Matsumoto, Japan) **Human fetal evoked response to acoustic stimulation.** *Acta Oto-Laryngologica*, 1969, Suppl. 252, 29-36.—Recorded human fetal evoked response to acoustic stimuli from the abdominal wall of 6 mothers at the 32nd-38th wk. of pregnancy. Tone bursts with 1000-Hz frequency, 50-msec duration, and decay time were given every 4 sec. through a bone vibrator attached to the maternal abdominal wall at the nearest place to the fetal ear. The responses were conducted through an active electrode located on the maternal abdominal wall in the vicinity of the fetal vertex and were averaged by a digital computer. The typical wave form of the response consisted of 4 prominent deflections: a negative, a positive, a negative, and a positive deflection with respective peak latencies of 100-150, 200-300, 500-600, and 700-800 msec. These deflections of the fetal evoked response were considered to correspond to the 4 components (N_1 , P_2 , N_2 , P_3) of the slow "vertex potential" to auditory stimulus in young children. However, no decision could be reached as to whether the obtained response originated in the fetal brain and depended on the fetal auditory function. (German summary)—*Journal abstract.*

8663. Torrance, E. Paul. (U. Georgia) **Dyadic interaction as a facilitator of gifted performance.** *Gifted Child Quarterly*, 1970(Fal), Vol. 14(3), 139-143. Presents 4 studies supporting the hypothesis that working in pairs facilitates creativity. In Exp. I, it was found that college students benefit more from this interaction than 5 yr. olds, their mean scores of originality being 86.4 determined by the Torrance Test of Creative Thinking as compared to 32.4 as judged by Torrance's Mother Goose Problems Test. This was explained by the decrease in egocentrism with age. Exp. II compared college juniors working in dyads and independently. The Ask-and-Guess Test and Product Improvement Test were used and the dyads again showed higher means of creativity (27.1 vs. 18.2). Consistent findings were attained with disadvantaged children. In Exp. IV, it was found that children working in pairs attempted more difficult tasks than those working alone or before a class.—*S. Krippner*

8664. Warren, David H. (U. California) **Intermodality interactions in spatial localization.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 114-133. Adults localize unseen auditory targets better with their eyes open than closed. This visual facilitation phenomenon was studied in 4 experiments to provide information about intermodality organization. Ss were 68 2nd and 6th graders, undergraduate and graduate students. Results indicate that the necessary condition for facilitation is the presence of structured visual input. While vision facilitated the pointing response to auditory targets, auditory acuity was improved. Results are

interpreted in terms of a visual mapping of auditory stimuli. Developmental work shows that Ss through 6th grade did not show visual facilitation effects. *Journal abstract.*

INFANCY

8665. Ball, William & Tronick, Edward. (Harvard U., Center for Cognitive Studies) **Infant responses to impending collision: Optical and real.** *Science*, 1971(Feb), Vol. 171(3973), 818-820.—24 2-11 wk. old infants responded to symmetrically expanding shadows, which optically specify an approaching object, with an integrated avoidance response and upset. This response did not occur for asymmetrically expanding shadows nor for contracting shadows that specify an object on a miss path and a receding object. The response was observed in all Ss regardless of age. The addition of kinetic depth information to the displays did not increase the intensity or likelihood of the response. In Exp. II, 7 Ss defensively reacted to the approach of a real object except when it was on a miss path.—*Journal abstract.*

8666. Bower, T. G., Broughton, J., & Moore, M. K. (Harvard U.) **Development of the object concept as manifested in changes in the tracking behavior of infants between 7 and 20 weeks of age.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 182-193. Studied the tracking behavior of infants in 4 experiments with a total of 38 2-5 mo. old Ss. Linear and circular trajectories, with partial occlusion of the trajectories were used. Results indicate that it was not until the age of about 4 mo. that Ss could be said to be tracking a moving object as an object.—*Journal abstract.*

8667. Fagan, Joseph F. (Case Western Reserve U.) **Infants' recognition memory for a series of visual stimuli.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 244-250. Employed the tendency of infants to distribute attention selectively to novel and familiar visual stimuli to study infants' recognition memory for a series of visual targets. 5-mo.-old infants demonstrated an unequal distribution of visual fixation to novel and familiar stimuli with more attention to the novel on both immediate and delayed stimulus-recognition tests for each of 3 novelty problems administered during a single testing session. The degree of differential fixation to novel targets exhibited no reliable decline from immediate to delayed testing and was not significantly altered by the serial order which the problem occupied during immediate recognition testing.—*Journal abstract.*

8668. Ferrer Guillén, Alfonso. (Inst. of Political Studies, Youth Inst. Madrid, Spain) **La relación madre-hijo y sus efectos en el desarrollo psicosexual durante la infancia.** [The mother-child relationship and its effects in the psychosexual development during infancy.] *Revista del Instituto de la Juventud*, 1970(Jun), Vol. 32, 7-56. Studied the infant's needs, e.g., satisfaction of appetite, environment, security, affection, and affection of the tenderness, and how they are the foundations for the attainment of an emotional and social life without serious disturbances or deviations. The mother's function in the psychoaffective and social development of the child is studied, e.g., a rigid disciplinary may unconsciously have a feeling of hostility toward the child. The seriously have a feeling of hostility toward the child. The relationship must have a double purpose: confidence in self and others. A child who was loved for himself as a person can express himself with confidence and feeling

that he is a true individual. But when the relationship consists of 1 at the service of the other, the way to autonomous growth is closed. (44 ref.)—*M. Faragana*

8669. Fitzgerald, Hiram E. & Bruckbill, Yvonne. (Michigan State U.) **Tactile conditioning of an autonomic and somatic response in young infants.**

Conditional Reflex, 1971(Jan), Vol. 6(1), 41-51.—Tactile classical conditioning of an autonomic reflex (pupillary dilation and constriction) and a somatic response (eyeblinking) was attempted in 2 separate experiments with 1-mo-old infants. The tactile CS was effective for conditioning eyeblink but was ineffective for elaborating conditional pupillary reflex dilation or constriction. These differences were related to the interaction between stimulus and response in infant conditioning and the source of nervous system innervation of the CR as it relates to conditionability.—*Journal summary*

8670. Greenberg, David J. & Welzmann, Fredric. (U. Nebraska) **The measurement of visual attention in infants: A comparison of two methodologies.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 234-243.—Tested 12 8-wk-old and 12 12-wk-old infants to determine fixation times to 3 checkerboard patterns of equal area, a 2×2 , 8×8 , and 24×24 . Each S was tested twice, once with a single stimulus presentation and once with paired-comparisons. Both methods were similar in depicting age and sex differences. Older Ss looked longer at the more complex patterns while female Ss fixated complex patterns longer, relative to simpler patterns, than did males. The paired-comparisons method was superior in distinguishing "blank looking" from meaningful perceptual-cognitive interaction with a stimulus. Results suggest that since females are more able to process information from static stimuli, they are ahead of their male age peers in their perceptual-cognitive development within this age range. (23 ref.)—*Journal abstract*

8671. Jensen, D. R. & Engel, R. (Virginia Polytechnic Inst.) **Statistical procedures for relating dichotomous responses to maturation and EEG measurements.** *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 437-443.—Applied a statistical approach to determine whether the ability to walk unaided at 1 yr. was related to neonatal photic latency measurements. 1,058 Ss were assigned to groups established on the basis of conceptional ages. Neonates having long photic latencies contributed proportionately fewer free walking individuals at the 1-yr examination, whereas the fast reactors at birth exhibited a higher percentage of early walkers. The significance of this relationship is demonstrated. It is concluded that the statistical procedures used apply equally well to other electrophysiological measurements and to other dichotomous responses for which the assumptions outlined here are satisfied. 8672. Landers, William F. (Texas Technological U.) **Effects of differential experience on infants' performance in a Piagetian Stage IV object-concept task.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 48-54.—Examined the effects of differential experiences on Piaget's finding that infants in Stage IV of object-concept development were unable to find an object they saw hidden at a 2nd position (B) after finding it earlier at the 1st position (A) of hiding. 42 7.5-10.5 mo. old infants, assigned to 1 of 3 equated groups, were observed playing a 2-position hidden-object game. Ss who had

experience reaching and finding an object at the 1st position made longer error runs at this position than Ss who had more searching experience at A or Ss who had experience reaching objects hidden at A but no experience reaching. Results are interpreted to support and extend previous observations and explanations of Stage IV of object-concept development. (15 ref.)—*Journal abstract*

8673. LeCompte, Güneş K. (U. Houston) **Violation of infants' expectations as a method of diagnosing levels of object concept.** *Dissertation Abstracts International*, 1971(May), Vol. 31(9-B), 5668.

8674. Ornitz, E. M., et al. (U. California, Center for the Health Sciences, Los Angeles) **The EEG and rapid eye movements during REM sleep in babies.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 350-353. Quantified EEG activity of 10-18 cps and eye movement activity during REM sleep in normal 6-8 mo. old infants. These values were compared to those previously reported for 19-47 mo. old normal and autistic children. The amount of 10-18 cps activity was greater and the mean duration of eye movement shorter in the infants than in the normal children, but was similar to that of the autistic children. The mean duration of eye movement bursts in the infants increased linearly with successive REM sleep periods. (French summary) (22 ref.)—*Journal summary*

8675. Pechstein, J., et al. (U. Munich, W. Germany) **Zusammenhänge zwischen EEG-Schätzalter und psychomotorischem Entwicklungsstand bei Kindern aus Säuglingsheimen.** [Relationship between EEG estimated age and psychomotor development condition in children from orphanages.] *Nervenarzt*, 1971(Feb), Vol. 42(2), 79-85.—Investigated the relationship between the EEG and clinically diagnosed developmental state in 99 3-18 mo. old healthy infants who were reared in various orphanages. An attempt was made to determine whether evidence of retarded development would be found in these infants as would be expected from recent research with animals. A correlation between degree of development as clinically diagnosed and EEG variables was found. Infants with retarded development had "younger" EEGs. These results support the idea that exogenous stimulation during early development is important. (41 ref.)—*E. R. Wist*

8676. Sameroff, Arnold J. (U. Rochester) **Can conditioned responses be established in the newborn infant: 1971?** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 1-12. Examines the learning capabilities of the human newborn. Classical conditioning is difficult to demonstrate in the newborn, while operant conditioning is possible. 2 hypotheses are evaluated as explanations for difficulties in conditioning the newborn: (a) the newborn is unable to respond to stimulus change, or (b) the newborn is able to respond to a general change but cannot respond to specific differences in stimulation. It is proposed that classical conditioning may involve the integration of 2 sensory modalities: that of the CS and the UCS. The newborn infant must 1st develop cognitive systems, through his experience with various stimuli, to differentiate each modality separately before he can integrate any 2 modalities in classical conditioning. The roles of the orienting and defensive reactions are discussed. (65 ref.)—*Journal abstract*

8677. Simner, Marvin L. (U. Western Ontario, London, Canada) **Newborn's response to the cry of another infant.** *Developmental Psychology*, 1971(Jul)

Vol. 5(1), 136-150.—Conducted 4 experiments with a total of 97 male and 98 female newborn infants to determine whether reflexive crying occurs in newborns and to define the parameters that control this behavior. It was found that (a) vocal properties of the newborn's cry were effective in promoting crying in other newborns, and (b) that feedback from the infant's own cry may be instrumental in the development of this behavior. Data were obtained questioning the likelihood of a direct relationship between reflexive crying and the later development of preverbal vocal behavior. Ancillary results pertaining to a seasonal trend, sex differences, and the role of arousal in supporting reflexive crying are provided. (39 ref.)—*Journal abstract*.

(Southern Illinois U.) **Application of multivariate techniques to developmental data: The derivation, verification, and validation of a predictive model of twenty-four month cognitive development.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5216-5217.

8679. Taguchi, K., Picton, T. W., Orpin, J. A., & Goodman, W. S. (U. Toronto, Ontario, Canada) **Evoked response audiometry in newborn infants.** *Acta Otolaryngologica*, 1969, Suppl. 252, 5-17.—Recorded the auditory evoked responses of 250 normal infants (6 hr. to 12 days old) during natural sleep, using an averaging computer. The evoked responses had 2 prominent components (P_2 and N_2), which in deep sleep were of larger amplitude and of longer peak latency than in light sleep. Ss showed lower thresholds to lower frequency stimuli. The thresholds of Ss less than 2 days old were higher than those of older Ss. The peak latency of component N_2 was longer in younger Ss especially in deep sleep. There was a significant air-bone gap in the thresholds of Ss under 2 days old; this indicates a conductive hearing impairment in the early days after birth. Infant maturity cannot be determined precisely through study of the evoked responses because of their great variability. (German summary) (23 ref.)—*Journal abstract*.

8680. Van den Daele, Leland D. (Educational Testing Service, Princeton, N.J.) **Infant reactivity to redundant proprioceptive and auditory stimulation: A twin study.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 269-276.—Continuous redundant stimulation inhibits infant activity. This effect appears independent of specific experience or response history. In this study, the contribution of genetic disposition to regulation of infant response to redundancy was evaluated through observation of the behavior of 3 sets of fraternal twins and 6 sets of identical twins to combinations of redundant proprioceptive and auditory stimulation. Treatment was associated with a significant decline of infant activity independent of zygosity, and when groups were compared, identical twins were significantly more concordant for behavior during and after treatment. 8684. Delorme, Andre & Pinard, Adrien. (U. Montreal, Inst. of Psychology, Quebec, Canada) **Relations entre la notion et la perception de la vitesse relative chez l'enfant.** [Relations between the idea and the perception of relative speed of the child.] *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 209-216.—Administered 2 tasks bearing on the perception and concept of relative velocity to 7-, 9-, 11-, and 13-yr-old children (24 at each age level). The perceptual task presented an illusion created by the movement of a target on a moving background, while the conceptual task was a modified version of Piaget's technique. In each task the 2 movements involved were either in the same (MS) or in the opposite direction. It was found that the illusion appeared earlier than the corresponding concept under the MS condition. The possibility of a retroactive effect of the concept on the percept is suggested.—*English summary*.

8685. Feldmann, Harry. (U. Geneva, Switzerland) **Psychomotor assessment and rehabilitation of socio-culturally deprived children.** *Acta Paedopsychiatrica*, 1970(Sep), Vol. 37(9-10), 268-293.—In the absence of physical or mental disturbances, certain socio-cultural influences may prevent a normal cultural adaptation because of social or educative difficulties in integration. The testing of children with cultural deprivations must never be made by means of static tests based on examination of mental level or intellectual efficiency, but only by means of a dynamic examination of the learning capacity of a given order. The educability and learning capacity of such children must be examined as a function of psychomotor potential and of plasticity of the neurological substratum. A method of psychomotor rehabilitation based on Jaques-Dalcroze rhythms, where the influence of music is considerable, permits the study of learning the model to imitate, of the recognition of corporal space, then temporal space, and finally field space, basic elements for grapholevel learning and the formation of conceptual thought. When motricity is redeveloped, the child is able to acquire a wider control of intellectual exigencies and of the socialization of his new environment. (39 ref.)—*G. Rubin-Rabson*.

8686. Gochman, David S. (U. Michigan) **The health ideation pictures (HIP): Reliability and internal consistency.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 271-278.—Describes a series of 11 pictures which provide a method of measuring health ideation and adaptive health behavior. Responses were obtained from 31 8-10 yr. old Cub Scouts. Coding procedures established for general perceptual awareness, health ideation, and adaptive health behavior, proved to be highly reliable, and the pictures were found to provide internally consistent measures within each dimension.—*Journal abstract*.

8687. Hanlon, Camille C. (Connecticut Coll.) **The effects of social isolation and characteristics of the model on accent imitation in fourth-grade children.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 322-336.—Investigated some possible deter-

minants of sociolinguistic change through the use of an experimental analogue. General American speakers were asked to learn the role of a British character in a puppet play under varying motivational conditions. 27 male and 25 female 4th graders served as Ss. In the absence of any instruction to do so, Ss who were exposed to a tape recorded model presented as nurturant and powerful imitated the model's British accent to a greater extent than did Ss who heard the same model presented as helpless. The effect of preceding social isolation interacted with the sex of the S and/or that of the model.—*Journal abstract*

8688. Johnson, Peter A. & Staffieri, J. Robert. (Bates Coll.) **Stereotypic affective properties of personal names and somatotypes in children.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 176.—Assigned 120 male 8-12 yr olds to 8 groups. Each group was requested to select adjectives from a list of 36 behavioral descriptions for 5 randomly ordered presentations of various names and/or body types. 6 names were selected for degree of commonness, and 4 body types were silhouetted: extreme endomorph, mesomorph, ectomorph, and dysplastic. Results indicate that (a) Ss had a stereotypic concept of traits associated with body types and names, and (b) body type was dominant.—*S. Knapp*

8691. Langmeier, Josef & Matějček, Zdeněk. (Postgraduate Medical Inst., Prague, Czechoslovakia) **Mental development of children in families and in infants' homes.** *Social Science & Medicine*, 1970(Dec), Vol. 4(5), 569-577. Outlines the development of residential homes for children in Czechoslovakia. Improvements in physical, educational, and psychological care are discussed. Comparisons of the physical, motor, adaptive, social, and language development of 5-36 mo. old infants raised in families with those raised in institutions reveal the latter group developing at below normal levels, improving by the 3rd yr., but always below the rate of the family raised children. Specific suggestions are made for the organization of residential homes and day nurseries. Innovative programs being established are noted.—*S. Knapp*

8692. Lerner, Richard M. & Schroeder, Christine. (Eastern Michigan U.) **Kindergarten children's active vocabulary about body build.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 179.—Categorized the words that 50 male and 26 female kindergartners used to describe fat and thin children as (a) physique and physical, (b) social, (c) personal, and (d) irrelevant. Ss made significantly more content than irrelevant statements and more physical than social or personal statements. Irrelevant statements were the 2nd most frequently made, followed by social and then personal statements. Results support the hypothesis of body build-behavior attitudes in children.—*S. Knapp*

8693. Lewis, Melvin; McCollum, Audrey T., Schwartz,

A. Herbert, & Grunt, Jerome A. (Yale U., Medical School) **Informed consent in pediatric research.** *Children*, 1969(Jan), Vol. 16(4), 143-148.—Deals with the problems of medical research on children, i.e., ethical concerns, possible harm or benefits to the child, the child's consent, and parental consent. 4 children participating in such research and the particular circumstances involved in their cases are discussed. Recommendations to be followed when children participate in medical research are presented: (a) a review committee should assess the research; (b) a professional should be available to deal with possible risks to the child; (c) the researcher should interview parents and the child; (d) a social worker or psychiatrist should be available to counsel parents if necessary; (e) interdisciplinary staff meetings should be held; and (f) follow-up care should be provided.—*D. 8696. Martin, J. E. & Molfese, Dennis. (Pennsylvania State U.) **Some developmental aspects of preferred adjective ordering.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 219-220.—Reports developmental normative data on the preferred adjective ordering phenomenon from an experiment with 381 4th, 5th, 7th, and 9th graders. Results show that (a) the ordering phenomenon is well established by the 9th yr., and (b) the variance of the scale values of the adjective on the dimension of preferred order is greater for older than for younger Ss.—*Journal abstract*

8697. Moore, James E. & Kendall, Diane G. (Communications Inst. of America, Dallas, Tex.) **Children's concepts of reproduction.** *Journal of Sex Research*, 1971(Feb), Vol. 7(1), 42-61.—A questionnaire was administered to 69 middle-class nursery schoolchildren to determine their knowledge of sexuality and birth. The results were in agreement with previous findings that few preschool-age children have any clear notion of human reproduction. The results provided no clear support for either the Freudian or Piagetian notions of the origins of babies. Although preschool children are curious about sex and reproduction the real understanding does not exist until about age 11. The following implications for sex education are made: (a) 3-5 yr. old children are curious, ready, and capable of learning accurate concepts of human reproduction; (b) sex education for young children is necessary; and (c) parents need sex education themselves. (29 ref.)—*E. B. Jaffa*

8698. Steinman, Warren M. & Boyce, Kathleen D. (U. Illinois) **Generalization imitation as a function of discrimination difficulty and choice.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 251-265.—Reinforced 4 5-yr-old girls for imitating 12 responses and did not reinforce imitation of 12 other responses. The nonreinforced responses were selected to be either topographically similar or dissimilar to the reinforced responses. Responses were modeled singly or in pairs. Nondifferential imitation occurred only on single-presentation trials. Ss imitated discriminatively on the choice trials even though they continued to imitate the same nonreinforced responses on the single-pres-

entation trials. Similarly, when the reinforcement contingencies were reversed by reinforcing the previously nonreinforced imitations, only the behavior on the choice trials was affected. Results suggest that generalized imitation may be a function of the methods used and is not necessarily related to a failure to discriminate response contingencies. (24 ref.)—*Journal abstract.*

8700. Wadlington, Walter. (U. Virginia, Law School) **A new look at the courts and children's rights.** *Children*, 1969(Jul), Vol. 16(4), 138-142.—Discusses several of the areas in which the courts have been increasingly concerned with the protection of children's rights. Several precedent cases are mentioned. Topics discussed are the rights of illegitimate children and of children affected by divorce proceedings, damage suits brought against parents by their children, and the rights of children to express opinions in society, such as engaging in political protest. (24 ref.)—*D. T. Lekarzyk.*

8701. Ward, William C. & Legant, Patricia. (Educational Testing Service, Princeton, N.J.) **Naming and memory in nursery school children in the absence of rehearsal.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 174-175.—Conducted 3 studies with a total of 83 nursery school children on the effects of labeling on short-term memory. Ss in each study were assigned to 1 of 2 groups in which they viewed stimuli pictures (a) in silence, or (b) during verbal naming. Following presentation of stimuli, Ss engaged in a 20-sec conversation with the tester and then attempted to select "target" stimuli from an array. Results indicate that naming without rehearsal significantly facilitated recall (combined $p < .002$).—*S. Knapp.*

8702. Yavuz, Halide S. (Robert Coll., Istanbul, Turkey) **Development of retention and organization occurring in free recall in Turkish children.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 203-209.—Examined sex and age differences in the development of item retention and organization occurring in free recall. The study compares the free recall of objects as perceptual stimuli in normal 8- and 12-yr-old children. The analyses of the data were conducted in terms of item retention and stimulus category repetitions. Results are interpreted in terms of Piaget's theory of conceptual development.—*Author abstract.*

Learning

8703. Adams, Janice F. (U. Wisconsin) **Learning to learn on a concept attainment task as a function of age and socioeconomic status.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5832.

8704. Allen, Sara A., Spear, Paul S., & Lucke, Jon R. (Chico State Coll.) **Effects of social reinforcement on learning and retention in children.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 73-80.—Administered an easy or difficult 2-choice simultaneous discrimination task to 96 male and female 1st-2nd graders and 96 male and female 5th-6th graders. 3 reinforcement conditions (approval, disapproval, or silence) were varied by 2 (female adult Es, each testing 24 Ss in each age-sex subgroup. Knowledge of results was provided independently after each response. Retention was measured after 8 days by a 3rd female E. Results suggest that disapproval affects both motivation and learning. Ss

receiving criticism responded at slower rates, made more errors, and were less likely to reach criterion than Ss receiving praise or silence. Younger Ss, especially boys, were more affected by disapproval than were older Ss. The differential effects of approval and disapproval for younger and older Ss on rate of response were also found on the retention test. (16 ref.)—*Journal abstract.*

8706. Findlay, Alice D. (U. Strathclyde, Glasgow, Scotland) **An investigation of the emergence of ability for partial and complete multiplication of classes in young school children.** *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 96-98.—Piaget's theoretical position assumes that complete multiplication will be an earlier development in the child than partial multiplicative classification and his experimental findings support this hypothesis. The present study doubts these findings since Piaget used different experimental situations in investigating the 2 types of multiplication. It was, therefore, hypothesized that children would find simple multiplication easier and hence make more correct responses in the finite choice situation than in the creative response situation. Results of an experiment with 96 5-10 yr. old children show that the sequential appearance of complete and partial multiplicative classification may be due to the experimental situations used, and therefore, complete multiplication as a necessary prior development to partial multiplication remains as an open question.—*Journal abstract.*

8707. Gusinow, Joan F., Price, Louis E., & Gusinow, M. A. (U. New Mexico) **A versatile apparatus for simple and complex learning.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 229-233.—Describes an apparatus which (a) automatically or manually presents any of a number of stimuli, (b) programs reinforcements for 3 problems independently, (c) concurrently allows for variation of all relevant intervals, e.g., stimulus presentation time, delay of reinforcement, ITI; and (d) automatically prints out latencies and correct or incorrect responses. It is suggested that this programming is especially suitable for studies in such areas as discrimination learning, learning set, operant conditioning, instrumental conditioning, and concept formation.—*Journal abstract.*

8709. Hyman, Lester M. (Michigan State U.) **The effects of irrelevant dimensions and stimuli on two-choice discrimination learning by children.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 249-250.—Presented 8 9-yr-old children with 24 8-trial simultaneous 2-choice visual discrimination problems. Each problem contained 8 different stimuli. In 11% of the problems the stimuli varied along 2 dimensions with 1 dimension irrelevant, and for the other 12 problems the stimuli varied along 3 dimensions with 2 dimensions irrelevant. Even though the number of irrelevant stimuli was the same, the 2-irrelevant-dimension problems were significantly more difficult than the 1-irrelevant-dimension problems. There was significant learning on both

types of problems and no significant interactions. —*Journal abstract.*

8710. Keller, Harold R. (U. South Carolina) **Children's acquisition and reversal behavior in a probability learning situation as a function of programmed instruction, internal-external control, and schedules of reinforcement.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 281-295. —Tested 192 5th-6th graders with a 3-choice contingent task in a $2 \times 2 \times 3$ factorial design combining (a) programmed instruction on selected probability concepts vs. no programmed instruction; (b) internal vs. external locus of control; and (c) 33, 66, and 100% schedules of reinforcement. The dependent measures were the percentage of correct acquisition responses, correct reversal responses, and pattern responses, as well as posttests on probability concepts. Major findings were associated with schedules of reinforcement. In acquisition and reversal, Ss under 100% reinforcement during acquisition tended to maximize the greatest, followed by the 66 and 33% conditions, in that order. The ordinal relationship among schedules was the exact reverse of the maximizing approach for the pattern responses. A partial reinforcement effect was obtained in reversal. Evidence indicates that programmed instruction and locus of control affected maximizing behavior, patterning behavior, and resistance to extinction (though these variables did not interact with reinforcement schedule in the predicted direction). Posttest data indicate that instructed Ss learned more than uninstructed Ss. (31 ref.) —*Journal abstract.*

8711. Lane, Joseph M. (U. Georgia) **The effects of verbal pretraining on the learning of paired associates by Negro and white first graders.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5851.

8712. Levin, Joel R. & Horvitz, James M. (U. Wisconsin) **The meaning of paired associates.** *Journal of Educational Psychology*, 1971(Jun), Vol. 62(3), 209-214. —Presented a printed paired-associate list containing 6 different types of items to 60 6th graders. 4 of the item types consisted of sentence-embedded paired associates on the study trials, followed by test trial cues varying in terms of their similarity in meaning to the study materials. The 2 remaining item types served as base-line measures of performance, i.e., controls. It was found that (a) the greater the semantic similarity between the study and test trial contexts, the greater was the recall of paired-associate items; and (b) at the same time, control item types presented in conjunctive phrases were better recalled than those presented in sentences. (24 ref.) —*Journal abstract.*

8713. Livesey, P. J. & Little, Audrey. (U. Western Australia, Nedlands) **Sequential learning by children.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 33-38. —64 yr. olds (3 male and 3 female) were trained on a 4-response double-alternation task and another 6 were trained on a comparable single-alternation task. On learning the task to criterion Ss were presented with sequences of extended length (8 response then 12 response). On mastering these they were then transferred to the alternative 4-response sequence. Unlike cats and monkeys, children mastered the single-alternation task more readily than the double-alternation task. Having learned the 4-response sequence all Ss were able to extend the sequence to 8- and then the 12-response length. As with cats and monkeys, learning 1 of the sequences (e.g., single alternation) appeared to facilitate

subsequent learning of the other sequence (double alternation). From their spontaneous verbalization appeared that children established symbolic representation of the sequence. With a number of 4-yr-old Ss, verbalization of the correct solution preceded correct performance of it. —*Journal abstract.*

8732 King, William L. (City Coll., City U. New York) A nonarbitrary behavioral criterion for conservation of illusion-distorted length in five-year-olds. *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 171-181.—Perceptually reversed the apparent length of 2 unequally long sticks by placing them in a Muller-Lyer illusion. 29 male and 18 female nursery school children served as Ss. After providing S with the information necessary to discount the illusory effect, he was asked to solve a problem which required him to choose either the physically longer or shorter of the 2 sticks. Choice of stick provided a behavioral criterion for conservation which was achieved by a majority of Ss. It is suggested that criteria relying solely on linguistic competence or based entirely upon feedback procedures will misdiagnose conservation.—*Journal abstract*

8734 Martin, Claude & Olson, David. (Ontario Inst. for Studies in Education, Toronto, Canada) Variety of exemplars versus linguistic contexts in concept attainment in young children. *Developmental Psychology*, 1971(Jul), Vol. 5(1), 13-17.—Tested the hypothesis that children learn concepts better through linguistic cues than through a variety of exemplars. 58 kindergartners were divided into 4 matched groups and taught 4 new concepts as follows: (a) with 3 instances (each presented twice) combined with 6 similar sentences; (b) with 3 exemplars (each presented twice) combined with 6 different sentences; (c) with 6 different exemplars combined with 6 similar sentences; and (d) with 6 different exemplars combined with 6 different sentences. Contrary to expectation, neither main effect, variety of exemplars, nor level of linguistic context was significant; however, a strong interaction between these factors was obtained. (20 ref.)—*Journal abstract*

8735 Palermo, David S. (Pennsylvania State U.) Characteristics of word association responses obtained from children in grades one through four. *Developmental Psychology*, 1971(Jul), Vol. 5(1), 115-123.—Administered a 100-item word association test to 50 boys and 50 girls in each of the Grades 1-4. The stimulus words were presented orally and the responses were given orally by Ss. Results are analyzed in terms of the frequency of various classes of responses, and comparisons are made of the oral and written methods of administration. Results suggest that the frequency of the most popular responses, contrast and superordinate responses, and paradigmatic responses increased over the grade levels included. The oral administration procedure appeared to increase the probability of popular and contrast responses but to decrease the probability of superordinate responses. (22 ref.)—*Journal abstract*

8736 Penk, Walter. (Veterans Administration Hosp., Dallas, Tex.) Developmental changes in idiodynamic set responses of children's word associations. *Developmental Psychology*, 1971(Jul), Vol. 5(1), 55-

63.—Conducted a $5 \times 3 \times 2 \times 2$ factorial study on 100 7-11 yr. olds, varying 5 age levels, 3 idiomatic types of stimulus words, 2 sexes of S, and 2 Es. The response set for functional relationships did not decrease as anticipated. The response set based on word classes obtained a significant quadratic age trend, means increasing from ages 7-10, and decreasing at age 11. The response set for dimensional words increased at age 11, as expected; however, the developmental changes were more complex than originally supposed because non-monotonic growth patterns occurred under the S sex and stimulus set conditions. Such trends necessitated changes in hypothesized developmental trends for each idiodynamic set, as well as changes in the terms by which development was conceptualized. *Journal abstract*

8737 Pollio, Howard R. & Whitacre, Janet D. (Tennessee) Some observations on the use of natural numbers by preschool children. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 167-174. Presented 3 groups of approximately 20 $3\frac{1}{2}$ to 6 yr. old children each with a number of tasks designed to assess skill in counting and enumeration. Contrary to usual expectations, certain counting tasks were more difficult than enumeration tasks, although both did show clear age trends. Results also show that Ss who could count when given a new point from which to start (regardless of age) performed consistently better on all other numerical tasks, perhaps indicating that fluent counting does not depend primarily on rote factors, but rather upon the recognition that natural numbers are a rule-governed system independent of the immediate perceptual environment. Results are also discussed in terms of Piaget's analysis of numerical development, with present findings seen as essentially supporting this analysis.—*Journal abstract*

8738 Schaeffer, Benson; Lewis, Joan A., & Van Decar, Annette. (U. Oregon) The growth of children's semantic memory: Semantic elements. *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 296-309.—Conducted 3 experiments with 42 1st, 52 5th and 42 9th graders, using semantic oddity problems. Results support the position that children learn superordinate elements later than subordinate ones. 1st graders understood very little about the superordinate elements, animate and inanimate. 5th graders understood them somewhat better, and 9th graders apparently understood them perfectly (but only used them when pressed). In contrast, 1st graders understood the subordinate elements, plant, animal, vehicle, and utensil, fairly well, and 5th and 9th graders apparently understood them perfectly. It is suggested that responses to semantic oddity problems reflect knowledge of semantic elements (competence), rather than use (performance), and that semantic oddity problems based on words give approximately the same results as those based on pictures.—*Journal abstract*

Abilities

8740 Ali, Faizunisa & Costello, Joan. (Inst. for Juvenile Research, Chicago, Ill.) Modification of the Peabody Picture Vocabulary Test. *Developmental*

Psychology, 1971(Jul), Vol. 5(1), 86-91.—Undertook a modification of the Peabody Picture Vocabulary Test (PPVT) to (a) standardize administration procedures and (b) control factors observed to affect adversely test performance of preschool disadvantaged children. The modified PPVT (MPPVT) consisted of 70 items randomized for difficulty level, specified stimulus instructions, and a controlled schedule of verbal reinforcements. The PPVT was administered to 52 and the MPPVT to 56 black children from the same preschool population. Results suggest that the MPPVT positively influenced test scores, and was well accepted by examiners. There were no sex differences. Errors increased when the reinforcement schedule changed from 100 to 50%. Suggestions are offered to increase the PPVT's usefulness with other age groups. (23 ref.)—*Journal abstract*.

8742. Feldman, Carol & Shen, Michael. (U. Chicago) **Some language-related cognitive advantages of bilingual five-year-olds.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 235-244.—Monolingual and bilingual 5-yr-old Head Start children were compared in their ability at tasks involving object constancy, naming, and the use of names in sentences. The 3 tasks constitute a natural sequence of language skills. They were all found easier for bilinguals than monolinguals, and this was clearest on nonverbal measures. In a further analysis it was found that switching names and using names in sentences was better in bilinguals but the knowledge of names and facility for acquiring new names was equivalent in the 2 groups. It is suggested that young children might first perceive names as attributes of things they name. With such a notion they might nonetheless easily learn new words. However, they later learn that names refer to the things they name because someone so uses them. Having a notion of meaning as a function of use might facilitate acquisition of the ability to use labels in sentences.—*Journal summary*.

8743. Friedman, Ronald. (U. Iowa) **The relationship between intelligence and performance on the Stroop Color-Word Test in second- and fifth-grade children.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 147-148.—The Stroop Color-Word Test was administered to 93 2nd and 5th graders. Significant correlations between time scores on the Stroop and intelligence were obtained for 5th graders. Absence of significant correlations for 2nd graders suggests that the required interference to make this a useful cognitive control task does not occur with younger children.—*Author abstract*.

8744. Goodnow, Jacqueline J. (George Washington U.) **Eye and hand: Differential memory and its effect on matching.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 89-95.—Hypothesized that memory for objects inspected by hand is less stable than for objects inspected by eye, and is more vulnerable to the increased load created by a greater number of comparison objects. 52 kindergartners, 40 4th graders, and 156 undergraduates completed matching tasks varying tactual and visual inspection and number of comparison objects. Results indicate that memory for information gathered by hand (a) was less stable than for information gathered by eye, and (b) was more likely to show loss when the number of comparison

objects was large. As memory demands increased, accuracy declined 1st on any matching that began with inspection by hand. (French & German summaries) (17 ref.)—*Journal abstract*.

8746. Kazakova, T. G. **Risovanie mladshikh doshkol'nikov.** [Drawings of younger preschool children.] USSR: Prosveshchenie, 1971. 25 K.—Discusses the possibility of developing artistic pictorial feeling in drawings of small children. Specific features of drawings made by 2-4 yr. old children were analyzed, and the pedagogical guidance of the children's drawing process was outlined. The essential features which should be utilized when forming images in drawings of small children were determined. Individual peculiarities of drawings were shown.—*J. Halev*.

8747. Keely, Karen. (U. Western Australia, Nedlands) **Age and task effects in short-term memory of children.** *Perception & Psychophysics*, 1971(Jun), Vol. 9(6), 480-482.—Tested 12 male and 12 female 4-, 8-, and 14-yr-old children on a visual memory task with easy- or hard-to-label displays and with or without repetition of stimuli over trials. 8 pictures were displayed in serial order, and the task was to find the card in the array that matched an identical probe card. Performance improved with age, and strong serial position effects were obtained for all ages and tasks. In contrast to previous studies, primacy effects were obtained for the youngest Ss tested. Task difficulty increased with difficulty of labeling and with repetition, but order to task difficulty remained the same for all ages. The d' measure, borrowed from signal detection theory, revealed differences in criterion levels over serial position, which in earlier studies had been confounded with strength of memory.—*Journal abstract*.

8749. Owen, Dean H. (Ohio State U.) **Developmental generality of a form recognition strategy.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 194-205.—Conducted 1,250 trials in a form recognition task with a 5-yr-old male S. S was required to find a form among 25 others on each trial. 50 different 8-sided randomly derived polygons were used as forms to be recognized, each presented in 25 different problems. Factors based on physical measures of the forms were correlated with observed latencies using multiple regression to assess an information utilization strategy. Comparisons of the regression profile and correlations of a physical measures with latency for the S with those for a group of 25 adults indicate that use of form information was highly consistent across age levels. (21 ref.) *Journal abstract*.

8750. Skioptu, U. **Nekotorye psikhologicheskie problemy esteticheskogo vospitaniya.** [Some psychological problems involved in aesthetics training.] *Doshkol'noe Vospitanie*, 1970(Dec), Vol. 43(12), 75-76.—Presents the results of a study of over 800 drawings by kindergarten children. It is concluded that a "complex disharmony exists between the development of drawing abilities (the technique of drawing) and the development of imagination (the ability to see in one's mind the

object)." This also affects the child's ability to symbolize.—*J. D. London.*

8752 Filderman, Irving P. (Memphis State U.) An analysis and investigation of the relationship between distance and near visual acuity among one hundred and twenty fourth, fifth, and sixth grade students. *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5841.

8753 Greenspan, Steven B. (Indiana U. Div of Optometry) Effects of children's nearpoint lenses upon body posture and performance. *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Dec), Vol. 47(12), 982-990. In a pilot study, 11 4-13 yr old children performed a nearpoint pencil-and-paper task while wearing: (a) plano lenses, (b) lenses which corrected the S's ametropia, and (c) a +.50 to +1 D addition in combination with ametropic correction. 3 distances between body points were measured photographically. 7 Ss showed significant changes in posture and performance while wearing nearpoint lenses of various powers. Data for all Ss suggest trends related to lens power. These trends featured systematic alterations in nearpoint working distance and performance with reference to a critical lens power approximated by dynamic retinoscopy for each S. (17 ref.)—*Journal abstract.*

8754 Pope, Peggy & Snyder, Robert T. (Prince George's County Board of Education, Upper Marlboro, Md.) Modification of selected Bender designs and interpretation of the first graders' visual-perceptual maturation with implications for Gestalt theory. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 263-267. 30 1st graders of average ability were administered Cards 3 and 7 of the Bender Visual Motor Gestalt Test and 4 modifications of each. Cards judged easy were reproduced with slightly less error. Interpretation of performance was in terms of the Gestalt principle of good continuation.—*Journal abstract.*

8755 Werdelin, Ingvar & Stjernberg, Gunnar. (School of Education, Malmö, Sweden) The relationship between difficulty and factor loadings of some visual-perceptual tests. *Scandinavian Journal of Psychology*, 1971, Vol. 12(1), 21-28. Investigated the possibility of changing factor loadings by varying the difficulty and complexity of the same visual-perceptual tests. 171 6th graders were given 27 tests. Some of the tests defined reference factors; others were differently difficult versions of 4 tests from separate parts of the visual-perceptual field. Data were treated by factor analysis, yielding 4 factors: reasoning (R), space (S), number (N), and perceptual speed (P). It was found that (a) the more difficult the test, the higher its loadings on the S and R factors; and (b) the easier the test, the higher its loadings on the N and (particularly) the P factors.—*Journal abstract.*

Personality

8756 Carmichael, Laraine M. & McFarland, Margaret

B. (U. Pittsburgh) Expressions of personality in creations of latency age children. *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 271-279. Investigated whether or not demonstrable relationships exist between children's personality traits, and the characteristics of their creations and use of materials. 3 latency-age children were given the task of using a variety of materials characterized by color, shape and texture to make a creation under controlled conditions. Results indicate the existence of definite relationships between personality traits and creation characteristics.—*Author abstract.*

8757 Eysenck, Sybil B., Nias, D. K., & Eysenck, H. J. (Inst. of Psychiatry, London, England) The interpretation of children's Lie scale scores. *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 31-37. 390 11-13 yr old children were given an intelligence test (the Progressive Matrices nonverbal intelligence test) and a 100-item personality inventory, purporting to measure extroversion (E), neuroticism (N), and the tendency to put themselves in the best light (L scale). Factor analysis of the intercorrelations between items gave rise to 3 clearly defined independent factors identified as E, N, and lying (L). Intelligence correlated significantly only with L ($r = -.29$). It is suggested that results support an interpretation of the L scale in terms of "lack of insight" rather than propensity to lie, although under highly motivating conditions the L scale may fulfill this function also.—*Journal abstract.*

8758 Minetos, Peter. (U. Alabama) Influence of male intervention figure upon sex-role identification of certain preschool children. *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5208.

8759 Richardson, S. A. & Green, A. (Albert Einstein Coll. of Medicine, Yeshiva U.) When is black beautiful? Coloured and white children's reactions to skin colour. *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 62-69. Explored the values London school children hold toward peers with dark as compared to light skin color. Ss were 195 black and 399 white 10-11 yr. old children. Values were defined as choice or preference behavior. Preference rankings were obtained using a set of pictures of a child in which all characteristics were held constant except skin color and the presence or absence of a physical handicap. On the average, boys and girls, black and white, preferred light to dark skin color. A black S without a physical handicap was liked more than white Ss with physical handicaps. Other results were obtained.—*Journal abstract.*

8760 Taviel de Andrade, Antonio R. (Inst. of Social Security for Government Workers, Mexico, D.F.) Algunas consideraciones sobre la reacción de celos en los niños. [Some considerations on the reaction of jealousy in children.] *Revista de la Clínica de la Conducta*, 1969(Feb), Vol. 2(4), 38-44. Theorizes that jealousy in the child is a reaction of self-preservation and security. The theory is based on the fact that the child (a) is in the process of maturing, (b) depends almost wholly on adults for the satisfaction of his physical needs, and (c) needs to develop in an environment which assures his self-preservation. Expressions of child jealousy are described (a) regression to infantile behavior, (b) aggressiveness directed toward the mother or siblings, (c) sadness or tendency to depression, (d) changes in diet, and (e) upsets in bowel and urine elimination. It is concluded that all these manifestations have a common denominator.

nator: with this form of competition and egoism, the child captures the greater attention of the adults he depends on. This manifested jealousy, is the mechanism which tends to preserve his personal security in a changing environment on which he depends wholly because of his biological immaturity. (French summary)—*English summary.*

8761. Wolfensberger-Hässig, Christoph. **Über angeborene und erworbene Ängste im frühesten Kleinkindalter.** [Concerning innate and acquired anxiety in the earliest years of childhood.] *Praxis der Psychotherapie*, 1969(Oct), Vol. 14(5), 225-235.—Describes an 8-mo-old child who developed a phobic reaction accompanied by avoidance following the sight of his mother washing her hair and using hair curlers. A 2nd case of a 9-mo-old child who saw her father taking a bubble bath and experienced an anxiety attack is described. In both cases reactions were attributed to fears evoked by the unknown or strange. In early childhood, the following are seen to be typical sources of anxiety: (a) perceived increased head size in parents (caused by wearing curlers, a hat, etc.), (b) absence of a parent, (c) the appearance of strangers, (d) observation of aggressive acts performed by a parent, and (e) observation of fear on the part of a parent. Other common phobias, e.g., electric shavers, electric coffee grinders, etc., are discussed.—*B. A. Stanton.*

8762. Yando, Regina M. & Kagan, Jerome. (Harvard U.) **The effect of task complexity on reflection-impulsivity.** *Cognitive Psychology*, 1970(May), Vol. 1(2), 192-200.—Classified 2nd graders as either reflective, impulsive, or nonextreme on the basis of their performance on the original 6 variant Matching Familiar Figures (MFF) Test. Following classification, 84 Ss were given 10 different forms of the MFF, with an increasing number of alternative responses, to determine whether or not they would retain their preferred mode of decision-making behavior independent of task complexity. Ss' tendency to be reflective or impulsive was a remarkably stable feature of their problem-solving behavior and a better predictor of errors than the number of alternative responses. The educational implications of the findings are discussed.—*Journal abstract.*

Social Behavior

8763. Barnes, Keith E. (South Okanagan Mental Health Center, Kelowna, British Columbia, Canada) **Preschool play norms: A replication.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 99-103.—Compared present preschool play behavior with play norms collected by M. Parten (see PA, Vol. 7:3543) in 1927. 42 3-5 yr. old preschoolers, enrolled in a cooperative kindergarten, were observed in a daily 1-hr free-play session over a period of approximately 12 wk. Results indicate that the present play behavior of preschoolers was significantly less social. 2 possible explanations for such change are suggested: (a) the number of hours preschoolers are exposed to the mass media, and (b) the marked reduction in family size that has occurred in the last 2 decades.—*Journal abstract.*

8764. Christy, Pauline R., Gelfand, Donna M., & Hartmann, Donald P. (U. Utah) **Effects of competition-induced frustration on two classes of modeled behavior.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 104-111.—Assigned 135 1st and 2nd grade boys in S pairs to witness either an aggressive or a nonaggressive

high active model, or engage in social interaction with an adult. Each S then experienced either success or failure in competitive games, or played noncompetitively. Observation of free-play behavior revealed that (a) competition facilitated the class of modeled behavior under both aggressive and high active conditions; (b) success and failure were equally effective in enhancing the class of modeled response; and (c) the relative ordering of the effects of success, failure, and no competition was consistent within Ss' grade level, but differed across grades. Results suggest that current vicarious experiences, whether aggressive or high active, play a major role in determining the nature of response to competition-induced frustration. (21 ref.)—*Journal abstract.*

8765. Cohen, Stewart. (U. Illinois) **An examination of frustration-aggression relations in boys during middle childhood.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 129-140.—Standardized interviews focusing on interpersonal experiences characterized by reports of punitiveness, restriction, and rejection in social relations with mother, father, teacher, and peers were administered to 4th and 6th grade boys. Scores derived from a conversion of the interview data were correlated with a sociometric measure of aggression. For the 4th graders, reports of frustration experiences for all 4 socialization agents considered were significantly correlated with the sociometric aggression measure. In all cases the correlations were negative. For the 6th graders, reports of frustration in peer relations were positively correlated with the aggression measure. A comparison of results with previously reported findings indicated a need for further research on the developmental implications of frustration-aggression relations in childhood. (28 ref.)—*Author abstract.*

8766. Douglas, Virginia I. & Shaffer, H. B. (McGill U., Montreal, Quebec, Canada) **Developmental changes in the attribution of blame.** *Canadian Psychologist*, 1971(Apr), Vol. 12(2), 248-253.—Constructed a story completion test to measure developmental changes in the methods used by children to assign blame in situations where the cause of unpleasant events was left ambiguous. Ss were 115 5-12 yr. old elementary schoolchildren. Results indicate that the tendency to blame others decreased with age whereas responses involving sharing of blame or recognition of impersonal and accidental causes increased with age. Findings suggest that a valuable tool for personality assessment of children could be constructed using the test described here together with story completion items designed to tap mechanisms for coping with other critical stress situations. (French abstract)—*Journal abstract.*

8767. Hamm, Norman H. & Hoving, Kenneth L. (U. Nebraska, Omaha) **Conformity in children as a function of grade level, and real versus hypothetical adult and peer models.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 253-263.—2 experiments were conducted with 2nd, 5th, and 8th graders to test the hypothesis that conformity to peers, as opposed to adults, is a positive function of age. Hypothetical (Exp. I) adults, and real (Exp. II) adults and peers chose different, but equally correct answers on a series of modified Asch-line tasks. Results indicate that (a) when either norm group chose 1 of the correct matches, in Exp. I, conformity to the chosen comparison line was an increasing linear function of grade level; and (b) the tendency of Ss to conform to peers, rather than adults, in Exp. II, was a

positive function of grade level. The former result conflicts with studies which report a negative or curvilinear relation between conformity and age; the latter result is consistent with standard treatments of adult-peer relations.—*Author abstract.*

8768. Hupkiewicz, Walter G. (State U. New York, Buffalo) **Film mediated aggression and its effect on children's interpersonal play.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5662

8769 Kagan, Spencer & Madsen, Millard C. (U. California, Los Angeles) **Cooperation and competition of Mexican, Mexican-American, and Anglo-American children of two ages under four instructional sets.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 32-39.—A game measuring cooperation and competition was played in pairs by 128 4-5 yr. old Anglo- and Mexican-Americans and by 192 7-9 yr. old Anglo-Americans, Mexican-Americans, and Mexicans. Cooperative play allowed both pair members to receive rewards; competitive play was irrational, allowing no S to reach his goal. The number of moves pairs took to reach a goal indicated that 4-5 yr. olds were more cooperative than the older Ss ($p < .001$). Among the 7-9 yr. old Ss, Mexicans were most cooperative, Mexican-Americans next most, and Anglo-Americans least cooperative ($p < .001$). Among the older Ss, instructional sets designed to create an "I" orientation increased competition, whereas sets stressing a "we" orientation increased cooperation ($p < .001$). Qualitative differences between patterns of play were noted for the cultural and age groups. Sex differences were not found. *Journal abstract.*

8770. Keasey, Charles B. (U. California, Berkeley) **Sex differences in yielding to temptation: A function of the situation.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 25-28.—It was hypothesized that the general lack of sex differences in resistance of temptation studies has resulted from the masculine nature of the "ray-gun" task employed. A less sex-typed task, a bowling game, was played by 54 boys and 54 girls from 4 6th grade classes. Girls yielded significantly more on all indices: proportion yielding, frequency, magnitude, and latency. It is concluded that obtained sex differences must be interpreted in light of the nature of the task employed.—*Author abstract.*

8771. Masters, John C. (U. Minnesota, Inst. of Child Development) **Effects of social comparison upon children's self-reinforcement and altruism toward competitors and friends.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 64-72.—Predicted that (a) children will engage in greater self-reward in the presence of a female E; (b) the self-reward data will replicate earlier studies; (c) self-reward and altruism will be negatively correlated; and (d) the effect of social comparison upon altruism will be the inverse of the effect upon self-reward. 120 4-5 yr. old boys and girls were instructed in same-sex pairs by a male graduate or a female undergraduate E in a game which varied payoff and social comparison. The predictions were confirmed with the exception that the negative relationship between self-reward and altruism was slight, though significant. (15 ref.)—*Journal abstract.*

8772. Peterson, Rolf A. (U. Illinois, Chicago) **Aggression as a function of expected retaliation and aggression level of target and aggressor.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 161-166.—Investigated the effects of previous aggression level of

aggressor and target persons, along with level of threatened retaliation, in an experimental situation which required aggressive responding. 4 male aggressors and 2 male targets, classified as high or low in aggressiveness, were selected from each of 10 3rd grade classrooms. Each aggressor responded to a high and low aggressive target; $1/2$ the aggressors expected retaliation and $1/2$ did not. Results suggest that low aggressive boys inhibit aggression when retaliation is expected whereas high aggressive boys aggress more when retaliation is expected than when it is not. (16 ref.)—*Journal abstract.*

8773. Slaby, Ronald G. & Parke, Ross D. (Washington) **Effect on resistance to deviation of observing a model's affective reaction to response consequences.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 40-47.—Presented a film to 132 5-8 yr. old boys and girls in which a male peer was either rewarded or punished for touching prohibited toys and subsequently displayed either a positive affective reaction (smile), a negative reaction (crying), or no reaction. Boys who saw the model rewarded deviated more than those exposed to a punished model, whereas response consequences had no effect on the girls. The model's affective reaction to rewarding and punishing consequences had a differential influence on Ss' behavior. Following a rewarding outcome, the negative affective reaction by the model produced less deviation than did the corresponding display of positive affect; however, when the model's affective reactions followed punishment, the negative reaction led to more deviant behavior than did the expression of positive affect. The importance of distinguishing these 2 classes of events in studies of modeling is stressed.—*Journal abstract.*

8774. Staub, Ervin. (Harvard U.) **A child in distress: The influence of nurturance and modeling on children's attempts to help.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 124-132.—32 male and 32 female kindergartners interacted with a female E who was either warm and friendly (nurturance) or neutral and task oriented (no nurturance). The E then went into an adjoining room, either to help a child there in response to mild distress cues (modeling) or to check on a child there (no modeling). Subsequently all Ss heard sounds of severe distress from the adjoining room while they were alone. Modeling and nurturance significantly increased attempts to help the distressed child. It is suggested that nurturance has an independent effect on behavior, and may have decreased fear of disapproval by Ss for possibly inappropriate behavior. Helping behavior was negatively related to family size. Correlations between teachers' ratings of Ss and their helping behavior were positive for boys and negative for girls. (28 ref.)—*Journal abstract.*

8775. Strauss, Richard B. (U. Tennessee) **The effect of changing a single behavior upon a behavior repertory.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5643-5644.

Parent-Child & Family Relations

8776. Biermann, Gerd. **Die Mutter-Kind-Beziehung in der frühen Kindheit.** [The mother-child relation in early childhood.] *Praxis der Psychotherapie*, 1969(Oct.), Vol. 14(5), 214-225.—Presents a comprehensive review of the nature of the close symbiotic mother-child relationship during the 1st yr. of life, especially the

formation of the basic behavior structure. The infant's earliest object relation is the infant's relation to the mother's breast which also serves as the 1st love object. Etiological factors involved in disturbances in the development of this relationship are primarily related to maternal anxiety which is seen to result in auto-aggressive, psychosomatic reactions in the child (e.g., asthma, eczema, colitis). The following are discussed as disturbances in maternal behavior which exert adverse influences on normal development in the child: (a) over-protectiveness, (b) cyclic mood changes, (c) overt or latent hostility, and (d) primary rejection of the child.—B. A. Stanton.

8777. Delhees, Karl H., Cattell, Raymond B., & Sweney, Arthur B. (U. Illinois) **The objective measurement of children's intrafamilial attitude and sentiment structure and the investment-subsidiation model.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 87-113.—Reviews alternative schemes and describes a new vector model for family research: the investment-subsidiation model. The factor-analyzed results of its empirical application to 160 children using 4 new, objective motivational devices on 38 intrafamilial attitudes revealed 10 drive factors (pugnacity, gregariousness, fear, assertion, narcissism, appeal, protection, acquisition, sensuality, and curiosity) and 3 sentiments (to father, mother, and sibling). It is proposed to set up batteries (the Family Motivation Analysis Test) useful for diagnosis and research on family attitude change. (34 ref.)—*Author abstract.*

8778. Freeman, Mary A. (Northwestern U.) **A comparative analysis of patterns of attitudes among mothers of children with learning disabilities, and mothers of children who are achieving normally.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5125.

8779. Roche, Dermot D. (New Ulster U., Coleraine, Ireland) **The Bene-Anthony Family Relations Test: Variations and reliability of administration procedure.** *Papers in Psychology*, 1970(Apr), Vol. 4(1 2), 12-15.—The Family Relations Test measures the direction and intensity of a child's feelings towards various members of its family, as well as the child's estimate of their reciprocal regard for him. This study increased the choice range for the child by providing for variations in administration procedures. The profiles from 2 such variations were compared with that obtained by standard procedures. The results showed no significant differences for "self," "father," "siblings 1 and 2," but significant ($p < .01$) differences for "nobody" and "mother." Despite these results, it is concluded that the standard technique possesses the greater utility.—S. L. Warren.

8780. Rosenberg, B. G. & Sutton-Smith, B. (U. California, Berkeley) **Sex role identity and sibling composition.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 29-32.—Examined responses of parents and children in 2-child families (boy-boy, boy-girl) to the Gough Scale of Psychological Femininity (89 families). Results indicate that sibling sex status is a significant source of variance in father sex-role scores while mothers are not similarly affected by the character of the siblings. This finding replicates an earlier finding with girl-girl and girl-boy families that fathers' scores are more feminine when they have sons than when they have daughters. The results suggest that girls' sex role is more affected by other family members, while boys are more

affected by sex-role standards outside the home.—*Journal summary.*

8781. Tocco, Thomas S. (U. Florida) **A mapping of parent-child self-concept transmission in Florida Model Follow Through participants.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5861.

ADOLESCENCE

8782. Biller, Henry B. & Liebman, Donald A. (U. Massachusetts) **Body build, sex-role preference, and sex-role adoption in junior high school boys.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 81-86.—Investigated the relationship between body build and 2 aspects of sex role (preference and adoption) in 9th grade boys. Height, weight, and chest girth were taken into account in body build categorizations. A questionnaire was used to assess sex-role preferences, and teachers rated the Ss on a multidimensional measure of sex-role adoption. Several relationships appeared among body build and the measures of sex role, but body build generally appeared to be more related to sex-role adoption than to sex-role preference. Endomorphs and ectomorphs, as a group, scored somewhat more masculine in sex-role preference but mesomorphs were rated higher (more favorably) on both masculine and feminine traits.—*Author abstract.*

8783. Brand, Judith. **The effect of highly aggressive content in comic books on seventh grade children.** *Graduate Research in Education & Related Disciplines*, 1969(Fal), Vol. 5(1), 46-61. Examined the influence of comic books with aggressive content upon the aggressive feeling of 90 12-yr-old Ss. In groups of 9, Ss wrote stories about 3 TAT cards, read a comic book, and then wrote stories about 3 other TAT cards. 3 types of comic books were used: nonaggressive, aggressive with human characters, and aggressive with nonhuman characters. The TAT stories were rated by 2 school psychologists and the E using the Jensen scale. A 3-way analysis of variance (Prior Level of Aggression \times Sex \times Type of Comic Book Exposure) was done using the posttest TAT ratings for 60 Ss. All 3 main effects were significant ($p < .05$), but none of the interactions was significant.—C. B. Tatham.

8784. Brown, Roger L. & O'Leary, Michael. (U. Illinois) **Pop music in an English secondary school system.** *American Behavioral Scientist*, 1971(Jan), Vol. 14(3), 401-413. The survey included approximately 700 students in 3 secondary English schools. Ss completed 2 self-administered questionnaires, 1 dealing with pop music and communication behaviors, and 1 dealing with friendship patterns, attitudes toward school, and demographic variables. In predicting interest and involvement in pop music, sex proved most evident, with girls scoring higher on most indices. Data further suggest "that involvement in the teen culture is more a function of where youngsters are headed in the social structure than where they have come from in terms of parental status." J. Parnicky.

8785. Casese, Sylvia F. **Contributo sperimentale allo studio dei rapporti oggettuali nell'adolescenza.** [Experimental contribution to the study of objective relationships in adolescence.] *Bollettino di Psicologia Applicata*, 1968, No. 85-87, 25-44. Made an experimental contribution to clarify the type of relationships in the normal adolescent regarding the psychoanalytical interpretation of the personality. 30 15-17-yr-old normal Ss without social inadaptability or character

disorders were given the Phillipson Object Relations Technique. The technique consists of 13 tables of objective relationships of 1, 2, or 3 persons, or a group, sex and age are ambiguous. Results show a prevalence of problems connected to the 1st yr. of life. In the majority of cases, an anxiety arose which indicated the prevalence of an Oedipus theme when confronted with a diagram of 3 figures. A small number of Ss gave answers which can be considered manifestations of depressive anxiety. The Oedipus problem finds solution in the tendency of the adolescent to detach himself from the family. This solution does not create an anxious type situation in the normal adolescent in which primitive defenses reappear. —A. M. Faraglia.

8786. Chaffee, Steven H., McLeod, Jack M., & Atkin, Charles K. (U. Wisconsin) **Parental influences on adolescent media use.** *American Behavioral Scientist*, 1971(Jan), Vol. 14(3), 323-340. Presents data based on a 1968 field study of 1,300 families in 5 eastern Wisconsin cities. Information was obtained via an interview with 1 parent and 2 questionnaires completed by an adolescent from each family. Although "the modeling correlations based on comparisons within each family... are weak and not very supportive of a direct-influence modeling interpretation, it appears that families with similar parent-child communication structures indirectly produce characteristic media use patterns that are shared by parent and adolescent on the average." Implications for future research are briefly suggested. (16 ref.) —J. Parnick.

8787. Clarke, Peter. (U. Washington) **Children's response to entertainment: Effects of co-orientation on information-seeking.** *American Behavioral Scientist*, 1971(Jan), Vol. 14(3), 353-369. Ss were 312 high school students from 2 suburban schools. Questionnaires were administered 4-5 days after students attended a symphony concert. Items included measures of information seeking and of coorientation. 6 hypotheses were tested. 40% of the Ss sought information about the symphony. None of the variables studied accounted for information seeking as much as the presence of favorable co-orientation partners. (32 ref.) —J. Parnick.

8788. Culey, James L. (U. South Dakota) **A study of the self-concept, self-acceptance, and ideal self of adopted and nonadopted adolescent children.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5658-5659.

8789. Danneberg, Erika. **Gruppenbildung in einer Mädchenklasse.** [Group formation in a class of girls.] *Gruppendynamik*, 1970(Apr), No. 2, 155-180. Studied the group structure and the position of individuals within groups of 33 16-yr-old Viennese high school girls because teachers usually know classes as totals, but individuals only in exceptional cases. Methods used were a questionnaire, a sociogram, and in some cases the Family Relations Test. Results point to the formation of 2 groups, 1 of which was homogenous regarding background and vocational interests and followed parental rules and school norms; the 2nd was less homogenous, had more tensions and problems, but was richer in interests and more critical of self and others. Roles of some of the girls, pairing, and isolates are discussed. Despite raising doubts about the general validity of results, it is believed that a description and an attempt at interpretation of group structure can be of help in school guidance and vocational consultations. —M. J. Stanford.

8790. Hill, John P. & Shelton, Jev. (Eds.) **Readings**

in adolescent development and behavior. Englewood Cliffs, N.J.: Prentice-Hall, 1971. xii, 446 p. \$7.50/paper.

8791. Josselyn, Irene M. **The capacity to love: A possible reformulation.** *Journal of the American Academy of Child Psychiatry*, 1971(Jan), Vol. 10(1), 6-22. Suggests 2 instinctual drives: the autoplasic drive or urge to be loved, and the alloplastic drive or the capacity to love others. The assumption is that turning outward for a need becomes a capacity to love as well as accepting love. If the inherent alloplastic drive is minimized, has atrophied from disuse, or is experienced with fear, character distortions and a feeling of loneliness, fulfillment ensues. The adolescent is discussed in relation to all-plastic drives as expressing an awareness of something lacking in himself. The stress placed on the need to be loved with little emphasis on the inherent urge to love, may explain some of the pseudo or genuine social pathologies of both adolescents and adults, thus, indicating guidelines for goals in working with the adolescents. —Journal summary.

8792. Lystad, Mary H. (National Inst. of Mental Health, Bethesda, Md.) **Adolescent social attitudes in South Africa and Swaziland.** *American Anthropologist*, 1970(Dec), Vol. 72(6), 1389-1397. —Analyzed the content of stories written by 42 male and 53 female South African and 52 male and 40 female Swaziland 13-19 yr old urban black students. The nature of the actors and their relationships in the stories suggest that, although South Africans in their early years encounter more elements of modernity than the Swazis, in their present situation they view the world as having less rational elements, fewer psychological satisfactions, and more threats to their physical welfare than do the Swazis. (15 ref.) —Journal abstract.

8793. Quadrio, Assunto & Peri, Giovanni. (Catholic U. of the Sacred Heart, Milan, Italy) **L'evoluzione degli interessi e delle aspirazioni nella pre-adolescenza: Ricerca longitudinale.** [Development of interests and aspirations in pre-adolescence: Longitudinal research.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 210-226. Results tend to confirm Piaget and Inhelder's concepts of "adolescent egocentrism" which represents an inconsistency and a contradiction between certain internal aspects of personality and other precarious, totally heterogeneous, and externally mediated information. This condition produces a marginality that derives from the conflict between infantile models, on the 1 hand, and resistance to change to new and more mature models on the other hand. (26 ref.) —L. L'Abate.

8794. Quadrio, Assunto & Peri, Giovanni. (Catholic U. of the Sacred Heart, Milan, Italy) **L'utilizzazione dei concetti di caso e di fortuna nel pensiero del pre-adolescente.** [Utilization of concepts of chance and luck in the thinking of the pre-adolescent.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 190-209. —In front of a guessing task, preadolescents assume a prevalently egocentric attitude that does not allow them to use correctly the notion of probability. (34 ref.) —L. L'Abate.

8796. Sinha, L. N., Krishna, K. P., & Sinha, J. K. (L. Patna, India) **Sex differences in colour preference of adolescents.** *Manas*, 1970(May), Vol. 17(1), 17-20. —50

13-19 yr. olds ranked 7 colors: red, orange, yellow, green, blue, indigo, and violet. Preferential rankings by the 2 groups were significantly different for red and orange. There was considerable agreement among males in their rankings of the 7 colors. This was not so in case of females. The rank-order correlation for the mean rank value of colors for the 2 sexes was not statistically significant.—C. Mehrotra.

8797. Wade, Serena E. (San Jose State Coll.) **Adolescents, creativity, and media: An exploratory study.** *American Behavioral Scientist*, 1971(Jan), Vol. 14(3), 341-351.—Reports results based on 105 high school sophomores from 2 upper-middle-class communities. Creative "potential" (divergent thinking) was determined by scores on 3 Guilford tests (Ideational Fluency, Alternate Uses, and Consequences); leisure activities were obtained via a questionnaire covering specific media behavior, media selection procedures, integration of media materials into other cognitive and behavioral patterns, and home environment. "The leisure time of the creative adolescent is full....[He] is a 'joiner'; he is also a hobbyist.... He reads about as much, watches TV less, and generally exposes himself to more highly diversified activities (including media) than his less creative peers." (15 ref.)—J. Parnicky.

8798. Ward, Scott & Wackman, Daniel. (Harvard U.) **Family and media influences on adolescent consumer learning.** *American Behavioral Scientist*, 1971(Jan), Vol. 14(3), 415-427.—Data were obtained from a 1970 survey of 1,094 8th-12th graders. Ss filled out self-administered questionnaires in randomly selected classrooms in 12 schools. Variables measured included: recall of ads, attitudes toward TV ads, materialism, effects of ads on buying, exposure to TV and magazines, family communication about consumption, social utility reasons, communication utility reasons, and various consumption reasons. A comparison of results, between younger and older students, indicate no significant differences on the learning variables, but do show differences on nearly all communication variables. (25 ref.)—J. Parnicky.

ADULTHOOD & OLD AGE

8799. Ansello, Edward F. (U. Missouri) **Age and meaningfulness with differentially paired associates: Acquisition and retention.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5190.

8800. Baltes, Paul B., Schaie, K. Warner, & Nardi, Anne H. (West Virginia U.) **Age and experimental mortality in a seven-year longitudinal study of cognitive behavior.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 18-26.—Examined the effect of age-related experimental mortality (e.g., physical survival and dropout) in a longitudinal study of intelligence and involving a carefully selected sample of 500 21-70 yr. old male and female Ss. After 7 yr., 302 Ss could be retested with Thurstone's Primary Mental Abilities Battery and Schaie's Test of Behavioral Rigidity. The performance of retest participants was compared with nonparticipants at the 1st occasion of measurement. 3 independent analyses of variances were conducted using estimated factor and scores for general intelligence, cognitive flexibility, and visuomotor flexibility as dependent variables. Significant differences between retest participants and nonparticipants were obtained for all age groups, with retest participants showing higher mean performances. Implications for the

internal and external validity of cross-sectional and longitudinal age gradients are discussed. (42 ref.)—*Journal abstract.*

8801. Hazen, Bronwyn R. **Is society meeting its responsibility to the aged?** *Australian Occupational Therapy Journal*, 1970(Jul), Vol. 17(3), 24-38.

8802. Leech, Shirley & Witte, Kenneth L. (U. Arkansas) **Paired-associate learning in elderly adults as related to pacing and incentive conditions.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 180.—Tested the hypothesis that the high number of omission errors found in research on verbal learning in elderly Ss may be due to overanxiousness. 12 male and 16 female 59-85 yr. old Ss were tested on a paired-associate task involving 4 pairs of CVC trigrams, presented at a fast or slow rate. All Ss received 3 tokens for correct responses and no tokens for omissions. $\frac{1}{2}$ the Ss received 1 token for commission errors, and the others no tokens for such errors. Reinforcing Ss for commission errors was significantly effective in reducing the omissions and number of trials to criterion ($p < .05$). The 2 incentive groups were not significantly different in commission or total errors. Pacing variables were not significant. Methodological difficulties are discussed.—S. Knapp.

8803. Lynch, Denis J. (U. Toledo) **Future time perspective and impulsivity in old age.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 245-252.—Examined the extent of future time perspective in an aged sample, and stated hypotheses concerning its relationship to other cognitive, behavioral, and personality variables. The hypothesis suggesting a relationship between impulsivity and extent of future time perspective was partially supported. The possible explanations for the lack of agreement between behavioral and self-report measures of impulsivity were considered, particularly in terms of the self-concept of the aged individuals. (22 ref.)—*Author abstract*

8804. Wilkie, Frances & Eldorfer, Carl. (Duke U., Medical Center) **Intelligence and blood pressure in the aged.** *Science*, 1971(May), Vol. 172(3986), 959-962.—Related diastolic hypertension to significant intellectual loss over a 10-yr period among 106 individuals initially examined at 60-69 yr. of age. Such loss was not found in their age peers in association with normal or mild elevations of blood pressure. Of 96 Ss initially examined at 70-79 yr. old, none with hypertension completed the follow-up program, and those with normal and mildly elevated blood pressure showed some intellectual decline over the decade. At the initial examination, hypertension was related to lower intelligence test scores only among those Ss who subsequently did not complete the follow-up program. Results suggest that hypertension is related to intellectual changes among the aged. *Journal abstract*

SOCIAL PSYCHOLOGY

8805. Ancona, Leonardo. (Catholic U. of the Sacred Heart, Milan, Italy) **La dinamica normale e patologica del comportamento sociale.** [Normal and pathological dynamics of social behavior] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 129-158.—From an experimental perspective, social behavior is related to an experimental perspective, social behavior is related to Levin's concepts of democratic, anarchic, and laissez-faire climates, Asch's phenomenological viewpoint, and

Witkin's field dependence-interdependence. From a clinical perspective, social behavior is related to Freudian defense mechanisms, communication theory, and Bateson's "double bind." (52 ref.)—*L. L. Abbot*

8816 Cole, Richard R. (U. Minnesota) **Top songs in the sixties: A content analysis of popular lyrics.** *American Behavioral Scientist* 1971(Jan) Vol. 14(1) 389-400.—The content of top 10 single songs during each yr. of the 1960s, based on ratings by "Billboard," were analyzed by 2 persons on the following variables: mood, love-sex, religion, violence, and social protest. Results indicate that most of the songs were sung by males and love-sex was the predominant theme. No formula for popularity was uncovered. (15 ref.)—*J. Paruleva*

8817 La Fave, Lawrence. (U. Windsor, Ontario, Canada) **Seven deadly sins of sociological scientism.** *et al.* 1967(Wint) Vol. 1(2) 14-15.—Discusses the "sins": (a) Concrete humanism assumes that sociology qua science must explain unique concrete and historical fact. (b) In puppet conformism, a social norm is a point. Once one conceives a social norm, thus it seems logical to conclude that social change cannot occur without nonconformity to this point. (c) In naive phenomenologism a type of unwarranted rationalism is envisioned which assumes a 1:1 relation (veridicality) between one's perception and the external world—that 2 people in the same place at the same time share the same experience. (d) Simplistic conceptualism is defined as an unwarranted type of rationalism in which an under-complicated isomorphism reifies mental experience to behavior. (e) Homocentrism. Since an area such as animal sociology exists, one hardly needs to be autistic to conceive that possibly that field is a part of sociology's domain. (f) Cultural relativism. Absolute and differential limens throw a blanket of soot on Lock's tabula rasa, and side with Gestalt negativism against empiricism in the psychology of perception. (g) Nonexplanationism. Not only are most sociologists ignorant of the new mathematics, but also of the new-new mathematics (the various modal logics) which are especially relevant to the very peculiar needs of the social sciences.—*Author abstract*

8818 Samsonov, R. **Sotsial'naya psikhika i formirovanie ubezhdenii.** [Social psychology and formation of conviction.] USSR: Aftan, 1970. 1 R. 10 K.—Examines basic problems associated with the formation of convictions according to basic laws of social psychology. The substance of the concepts "social psychology" and "ideology" are considered. Interrelationships and interactions of these phenomena with unity in the consciousness of the individual and social as well as rational and emotional factors are analyzed. Warns against the transformation of communistic ideas and convictions of masses during the purging of old ideology from social psychology.—*I. Hales*

CULTURE & SOCIAL PROCESSES

8819 Bergström, Lars. (Stockholm U., Sweden) **What is a conflict of interest?** *Journal of Peace Research*, 1970, No. 3, 197-217.—Presents a preliminary survey of different interpretations and definitions of "conflict of interest." Only those conflicts which involve 2 distinct parties, especially between groups and classes, are discussed. As a point of departure, it is presumed that there is a conflict of interest between 2 parties if, and

only if, their interests are incompatible. Subjective, objectivist, individualistic, and normative interpretations of "interest" are distinguished. The various interpretations of "incompatible" are examined. The suggestion that conflict theories tend to neglect "real" conflicts of interest is discussed. (Russian summary) (20 ref.)—*Journal summary*

8820 Derogowski, Jan B. (U. Aberdeen, Scotland) **Chain-type drawings: A further note.** *Perceptual & Motor Skills* 1971(Feb) Vol. 30(1), 102.—In an extension of H. Werner and W. Hudson's studies, an identification task with a set of 18 assorted animal models was presented to rural Zambian women with little or no education. 27 Ss were presented with 3 possible drawings of the drawings and asked to choose a better drawing, an elephant model being on display. 6 Ss were given 1 drawing and asked to point to the depicted animal in the array of models. Analysis suggests that there is no difference between the side-view and the chain-type drawings, both of which were preferred over the front view. The postulate that preferred chain-type drawing leads less often to identification than the non-preferred drawing was believed to hold if one contrasts the chain-type with the front-view drawing and not with the side-view drawing.—*P. Hertzberg*

8821 Derogowski, Jan B. (U. Aberdeen, Scotland) **Responses mediating pictorial recognition.** *Journal of Social Psychology*, 1971(Jun) Vol. 84(1), 27-33.—Groups of 20 Zambian women of little schooling were used in all 4 possible combinations of 2 kinds of stimuli (toys and their photographs) and 2 response arrays (toys and their photographs). Under all conditions Ss were given a stimulus (a photograph or a toy) and were required to identify the corresponding stimulus in an array. Results suggest that apart from the previously reported difficulties in the handling of pictorial material, additional difficulties arise when Ss are required to translate from 1 level of abstraction into another (photographs into toys and vice versa). (20 ref.)—*Journal summary*

8822 Dobkin de Rios, Marlene. (California State Coll., Fullerton) **A note on the use of ayahuasca among urban mestizo populations in the Peruvian Amazon.** *American Anthropologist*, 1970(Dec) Vol. 72(6), 1419-1422.—Relates the use of the psychedelic vine, ayahuasca (principal chemical agent, harmine), by ayahuasca (principal chemical agent, harmine), by mestizo folk healers to variables, e.g., cultural expectations of drug experiences and belief systems concerning illness. The subjective personal experience inherent in psychedelic use is considered to take on cultural coloration, as determinants of hallucinatory experience show strong relationships to cultural data.—*Journal abstract*

8823 Evans-Pritchard, E. E. (Oxford U., England) **Sexual inversion among the Azande.** *American Anthropologist*, 1970(Dec) Vol. 72(6), 1428-1434.—Describes male and female homosexual relationships as they were practiced among the Azande of the Sudan in pre-European times. Between males such relationships were approved of in the bachelor military companies and provided a sexual outlet for young men who could not marry until well into their 20s and 30s. Between females, especially in large polygamous homes where sexual outlets were limited, homosexual relations were said to have been frequent, but highly disapproved of. Some translations of a few texts on the subject are presented.—*Journal abstract*

Spaltro, Enzo. **Proposta di modelli psicologici dello sviluppo economico.** [Proposal on psychological models of economic development.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 307-315.—Kaldor's model of economic development using concepts of needs, expectations, learning, and risk is discussed and elaborated upon.—*L. L'Abate*.

8818. Spaltro, Enzo. **Psicologia dello sviluppo economico.** [Psychology of economic development.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 240-306.—Economic development needs to be considered according to psychological concepts of threshold awareness of needs, and of unhappiness and discontent. (45 ref.)—*L. L'Abate*.

8819. Testa Alavez, Juan. (Inst. of Political Studies, Youth Inst., Madrid, Spain) **Los jóvenes y la participación política.** [Youth and political participation.] *Revista del Instituto de la Juventud*, 1970(Dec), Vol. 32, 107-129. Develops the concept of patriotism as the "country of sons" rather than of forefathers. The concept of politics embraces both civil and social service. Political preparation and awareness must be emphasized in youth. To participate in politics is to be conscious that anything can be perfected. It is suggested that lowering of the voting age, possibility of eligibility in various areas, and associative action would aid in integrating youth in political areas. The young have a general desire to employ their energies in civil service of underdeveloped areas. Political participation of young people takes on an international picture. Their ideas are not only theoretical; protests against war, organizations which seek cooperation with international institutions, and programs to fight ignorance, hunger, and natural disaster have solid support from the young. The young wish to participate in an international society to construct a world in which the rights of man, peace, and brotherhood are found not only on paper, but in actuality.—*A. M. Farfaglia*.

8820. Tiberi, Emilio. **L'Italia dei francesi: Indagine su modelli socio culturali condotta secondo la metodologia della contingency-content analysis.** [The Italy of the French: Investigation of the socio-cultural models according to the methodology of the contingency-content analysis.] *Bollettino di Psicologia Applicata*, 1968, No. 85-87, 45-107.—Studied critically an investigation of the Italians by Frenchmen. The psychological study of a country cannot confine itself within the narrow limits of sociology or anthropology. It is concluded that because of the formal aspect under

which the study was undertaken, the investigation does not emigrate from the field of applied psychology. An impoverished representation of Italy and of its people is presented—reduced to its nervous system and its skeleton. "This was the scope of the application of a radiographic system of analysis, like the contingency content analysis." Data are explained and elaborated upon in order to clarify some of the findings. (37 ref.)—*A. M. Farfaglia*.

Ethnology

8821. Cowan, Gloria. (Wayne State U.) **Achievement motivation in lower class Negro females as a function of the race and sex of the figure.** *Representative Research in Social Psychology*, 1971(Jan), Vol. 2(1), 42-46. Administered TAT pictures, selected to elicit achievement motivation, to 102 black high school females. The race and sex of the figures in the pictures were varied. The figures portrayed black and white males and black and white females. Results were: (a) more achievement motivation to male as compared to female figures for female Ss, and no effect of race of figure on need achievement; and (b) female Ss wrote longer stories to black than white figures and to female than male figures.—*Journal abstract*.

8822. Glitter, A. George & O'Connell, Stephen M. (Boston U.) **Racial appearance of ideal blacks.** *CRC Report, Boston U.*, 1970(Dec), No. 48, 1-20. Describes a study of racial appearance of black male and female models. Data were collected from 4 issues/yr of *Ebony*, from 1952-1968. Pictures of 24 male and 24 female models were selected for each year. 34 photographs were also selected from 2 current issues and rated for racial appearance variables. Results indicate that (a) both males and females tended to be more Caucasian than Negroid in terms of physiognomy, skin color, and hair texture; and (b) while male models tended, with time, to become more Negroid in appearance in terms of all of these variables, female models did so only in terms of skin color.—*Journal abstract*.

8823. Jones, Stanley E. (Queens Coll., City U. New York) **A comparative proxemics analysis of dyadic interaction in selected subcultures of New York City.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 35-44.—2 studies investigated subcultural and sex differences in spatial orientation behavior. 2-person groups of adults in 4 separate poverty subcultures (Negro, Puerto Rican, Italian, and Chinese) were observed engaging in social interaction on the public streets of New York City. Trained judges made estimates of the interpersonal distance and mutual shoulder orientation of each dyad. Regardless of subcultural group membership, women were found to be more direct in shoulder orientation than men, an outcome which appears to parallel the findings of previous studies of eye-contact behavior. There was some evidence, as informants had predicted, that black males were less direct than males in other minority groups, although this result did not approach statistical significance. Finally, result did not approach statistical significance in all of the interaction distance was strikingly similar in all of the subcultures studied, contrary to expectations, suggesting the inference that poverty groups are rather homogeneous in the structuring of interpersonal distance.—*Author abstract*.

8824. Kiser, Clyde V. (Ed.) **Demographic aspects of the black community.** *Milbank Memorial Fund Quar-*

terly, 1970(Apr), Vol. 48(2, Pt. 2), 368 p. — Presents the proceedings of a conference on demographic aspects of the black community. Papers were presented on (a) specific demographic studies: regional and metropolitan distributions, age, education, occupation, income and poverty, voting, urbanization, and patterns of residential segregation; (b) attitudes toward marriage and the family, marriage and marital stability, and illegitimacy; and (c) fertility and family planning, contraceptive practice, and utilization of contraception and family planning programs. The discussions following each paper are reported. — S. Knapp

8825. Tedeschi, James T. & Levy, Terry M. (State U. New York, Albany) **Task-relevant information, social reinforcement, and race as factors affecting performance.** *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 148-155. — Hypothesized that lower-class blacks, who have been found to have an external control orientation to their environment, would be more responsive to social reinforcements in a skill task than in a chance task situation. Conversely, it was expected that middle-class whites, who have been shown typically to maintain internal control orientations, would be more responsive to social reinforcements in a chance task than in a skill task situation. 48 male 5th and 6th graders (24 lower-class blacks and 24 middle-class whites) were assigned to social reinforcement and control conditions. The independent variables, social reinforcement, type of task, and ethnic group of Ss were used in a $3 \times 2 \times 2$ analysis of variance. Results confirm the original hypotheses. (French summary) (16 ref.) — *Journal abstract*

8826. Yackley, Andrew & Lambert, Wallace E. (Haile Selassie I U., Addis Ababa, Ethiopia) **Inter-ethnic group competition and levels of aspiration.** *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 135-147. — Studied cultural variations of aspirations in a competitive situation using 9-11 yr. old French Canadian and English Canadian boys of similar social class backgrounds. Ss were assigned to solely French Canadian or English Canadian teams for a table hockey tournament. Each team played a same culture and a different culture team. French Canadian boys had higher aspirations for scoring points, especially when competing against English Canadian teams. These aspirations proved to be unrealistic in actual competition. It is argued that French Canadians possibly feel relatively deprived and hence overemphasize affective rather than cognitive factors when setting aspirations. Findings are discussed in terms of social evaluation theory, child-rearing values and practices, and societal influences which discourage the development of need achievement. (French summary) (21 ref.) — *Journal abstract*

Social Structure & Social Role

8827. Hofstetter, Merlin I. (U. Oregon) **The meaning of appropriate role behavior.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5518-5519.

8828. Kakar, Sudhir. (Indian Inst. of Management, Ahmedabad) **The theme of authority in social relations in India.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 93-101. — 31 stories, depicting situations of authority, were collected from 3 Indian states and their contents analyzed. The findings indicate that the most dominant authority theme in the story readers (prescribed texts for Indian schools) pertains to authority in

family situations. The main source of the authority is conditional. Its acceptance is traditional-moral, rational/legal, person, and competence being considerations by their relative insignificance. An interesting finding is that of the image of the superior as portage in these story readers, which in 100% of the cases is that of an autocrat—either assertive or nurturant—and that these authority figures enforce their authority primarily by providing conditional rewards to, and arousing guilt in the subordinate individual. — *Author abstract*

8829. Kaplan, Howard B. (Baylor Coll. of Medicine, Houston, Tex.) **Social class and self-derogation. A conditional relationship.** *Sociometry*, 1971(Mar), Vol. 34(1), 41-64. — Proposes that the lack of empirical support for the hypothesis of an inverse linear relationship between social class and self-derogation is due to the conditional nature of the relationship. The relationship is observed only for those segments of the population for which certain conditions hold. 4 such general conditions are stated. 9 variables were selected which appeared to reflect the presence of 1 or more of the conditions. For each variable it was hypothesized that, for Ss characterized by the variable, self-derogation would progressively increase as social class decreased. 500 personal interviews were studied. All but 1 hypothesis was supported at a statistically significant level. Results are interpreted (a) as congruent with the "conditional relationship" explanation; and (b) as supporting theoretical statements regarding the general conditions under which an experience, attribute, or behavior influence the genesis of self-derogatory attitudes. Methodological limitations and implications for future research are discussed. (5 p. ref.) — *Journal abstract*

8830. Leik, Robert K. & Nagasawa, Richard. (U. Washington) **A sociometric basis for measuring social status and social structure.** *Sociometry*, 1970(Mar), Vol. 33(1), 55-78. — Discusses a procedure for employing an economic input-output model, adapted by C. H. Hubbell (see PA, Vol. 40:2817) for sociometric clique structure analysis, to the analysis of the concepts of social status and structure. The procedure measures aspects of status and structure in a manner which derives directly from the meaning of the concepts, rather than as an assumed correlate of the concepts. Data from 125 members of a women's service club and a women's union are used to illustrate the plausibility and potential utility of the measure. Findings indicate that status and structure so measured covary predictably with certain control variables, and that some new and theoretically important information may be added by this type of analysis. (30 ref.) — *Journal abstract*

8831. Stephan, Walter G. & Stephan, Cookie. (U. Texas) **Role differentiation, empathy, and neurosis in urban migrants and lower-class residents of Santiago, Chile.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 1-6. — Interviewed 60 lower-class male residents of Santiago, Chile. 30 Ss were urban migrants; the other 30 Ss were born in Santiago. Projective measures of role differentiation and empathy were collected, as well as demographic information and a measure of neurosis. As predicted, role differentiation and empathy were positively correlated with each other and negatively correlated with neurosis. Urban-born Ss were higher in role differentiation and lower in neurosis than migrants; both groups were similar in empathy. Age and education seemed to be important variables in-

fluencing these relationships. Results are discussed in terms of transition problems of urban migrants. (20 ref.)—*Journal abstract.*

Religion

8832. Anderson, James D. (Episcopal Diocese of Washington, D.C.) **Pastoral support of clergy-role development within local congregations.** *Pastoral Psychology*, 1971(Mar), Vol. 22(212), 9-14.—Clergymen "who can be helped to see more clearly the specificity of role conflict and misunderstanding can also be helped to utilize the reality of those issues as opportunities in the mission and management of parish life." The consultant can often assist the clergymen in this fashion, at the same time helping him to find guides in decision making and in carrying out his day to day ministry. The consultation principle is illustrated with an example.—*O. Strunk.*

8833. Brown, Thomas E. (Northeast Career Center, Princeton, N.J.) **Career counseling as a form of pastoral care.** *Pastoral Psychology*, 1971(Mar), Vol. 22(212), 15-20.—Describes the activities of the Northeast Career Center in Princeton, New Jersey, in terms of the crises of integrity, power, capacity, failure, destination, role, and meaning. These various crises, experienced by clergymen, may best be resolved by looking within for clarity, since they cannot be resolved in the institution itself.—*O. Strunk.*

8834. Brown, Thomas E. (Northeast Career Center, Princeton, N.J.) **Career counseling for ministers.** *Journal of Pastoral Care*, 1971(Mar), Vol. 25(1), 33-40.

8835. Collie, Robert M. (United Methodist Church, Columbus, O.) **Counseling the middle-aged pastor.** *Pastoral Psychology*, 1971(Mar), Vol. 22(212), 50-53.—No longer faced with a crisis of "image" as is the youthful minister, the middle-aged pastor is struggling with what he has and with the possibilities of new dimensions. The 4 areas which lead the middle-aged clergymen to feelings of entrapment and with which he must cope are: (a) vocational, (b) marital, (c) intrapersonal, and (d) professional.—*O. Strunk.*

8836. de Bont, W. (U. Montreal, Quebec, Canada) **Le célibat sacerdotal aux Pays-Bas.** [The celibacy of priests in the Netherlands.] *Vie Spirituelle Supplément*, 1969(Sep), Vol. 22(90), 430-441.—In 1968 a survey was conducted among all Catholic clergy in the Netherlands. The 39 questions mainly concerned attitudes towards the church law of celibacy. 83% responded (N = 7,381). The present article summarizes the main results and criticizes the statistical analysis, especially the faulty use of multiple correlation techniques.—*Author abstract.*

8837. de Bont, W. (U. Montreal, Quebec, Canada) **Le sécularisation de l'eschaton.** [The secularization of ethics.] *Vie Spirituelle Supplément*, 1969(Nov), Vol. 22(91), 462-482.—Prevalent contemporary morality is shown to be considerably more relaxed than the old Christian one. It is "secular" in a double sense: (a) The goal of human strivings is no longer a faraway contact with God but the more or less immediate satisfaction of man's basic drives, of which there are about 13 according to Cattell's factor analyses, altruism being 1 of them. (b) The means to reach this goal are determined by more or less rational considerations, not by biblical or ecclesiastical authority. A survey of pertinent research shows why the decline of Christian and the upsurge of hedonistic morality does not lead to chaos: (a) Most people have quite limited basic drives, e.g., the low use of

pornography in liberal Denmark. (b) Religious ethics produce only more ascetism but not more altruism than secularized morality. (c) Other faraway absolutes, e.g., democracy, are sometimes substituted for the religious ones, in which case there is a rather limited version of secularization. (d) Most people act very differently from what their official Christian ethics proclaim. So the gap between traditional Christian and hedonistic morals is more verbal than real. (40 ref.)—*Author abstract.*

8838. Godin, Andre. (Lumen Vitae, Brussels, Belgium) **Pastoral psychology in French-speaking Europe (Belgium-France-Switzerland).** *Pastoral Psychology*, 1971(Jan), Vol. 22(210), 41-47.—Although few seminaries or theological institutes in Belgium, France, and Switzerland have introduced psychological supervision of pastoral activities, recent developments show definite trends—Rogerian influences in Belgium, psychoanalytic orientations in France and Switzerland, and training groups in many areas. Described is the program at the Institutes for Cathetics and Pastoral Work in Brussels, Louvain, Paris, Strasbourg, Lyon, Fribourg. These training centers are emphasizing much more direct experience and field work.—*O. Strunk.*

8839. Houts, Donald C. (St. Paul's School of Theology, Kansas City, Mo.) **Ego identity and professional preparation for ministry.** *Journal of Pastoral Care*, 1971(Mar), Vol. 25(1), 12-23.—Basing research on the ego-identity work of Erikson and instrumentation on Marcie's Ego Identity Status scale, 111 male students seeking their 1st professional degree were interviewed to determine identity achievement, foreclosure, moratorium, and identity diffusion. It is suggested that graduate theological education presupposes that effective ministry is more akin to integrity of life style than to mere successful role definitions.—*O. Strunk.*

8840. Mahon, Robert. **An example of the use of professional development groups in support of new ministers.** *Pastoral Psychology*, 1971(Mar), Vol. 22(212), 31-38.—Describes the Parish Internship Program of the Episcopal Dioceses of Washington and Maryland as an example of the use of professional development groups in support of new ministries. Evaluation of this experience indicates that it is "imperative that there be an understanding of the need to restore harmony within the clergy before serious thought can be given to trying to influence the laity."—*O. Strunk.*

8841. Pruyser, Paul W. (Menninger Foundation, Topeka, Kan.) **A psychological view of religion in the 1970s.** *Bulletin of the Menninger Clinic*, 1971(Mar), Vol. 35(2), 77-97.—Argues "that religion will continue to influence the minds of men [discusses the] manifestations of the irrational which influence religion or are intertwined with it, and [sketches] new trends and forces that are likely to influence religion in a creative direction." *J. Z. Fhas.*

8842. Puerta, Ricardo A. **Psychologism and the Catholic Church.** *Cornell Journal of Social Relations*, 1970(Fal), Vol. 5(2), 182-198.—Analyzed the legitimization process of psychologism within the Catholic church within the last 50 yr. 3 differentiated states are involved: (a) total rejection of psychologism because its philosophical foundations seemed to contradict those of the Church; (b) there was a long debate between its practical utility and concepts of man and society behind it, and (c) there was a partial acceptance of its philosophical principles and theories, as well as total agreement with its practices. The symbols and practical consequences that

the legitimization process has brought into the formation of new priests and into the new relationship between the priest and his parishioner are examined. The religious model formulates the understanding of man in terms of "faith" and "religious issues" and the psychological model explains it through "scientific reasons" and "psychological issues."—J. DiGiovanni.

8843. Sims, Bennett J. (Virginia Theological Seminary, Alexandria) **Continuing education as a peer support experience in the dynamics of change.** *Pastoral Psychology*, 1971(Mar), Vol. 22(2), 39-43, 66.—Describes the continuing education program at the Virginia Theological Seminary. Several years of experience led to the conviction that continuing education for ministers must be based in an affirmation of the personhood of the minister and then helping "him develop skills appropriate to the practice of ministry in a time of social and institutional upheaval."—O. Strunk.

8844. Sims, Edward R. (St. Francis Episcopal Church, Potomac, Md.) **WECA: A response to passivity and isolation among parish ministers.** *Pastoral Psychology*, 1971(Mar), Vol. 22(2), 44-49.—Provides a brief history of the founding and development of the Washington Episcopal Clergy Association, an organization attempting to answer the question, "Can a medieval class-profession find happiness in the 20th century?"—O. Strunk.

8846. Thurston, Branson L. (Syracuse 1) **A comparison of selected psychological health factors and perceptions of administrative procedures in those ministers and seminary students perceiving the administrative role to be more integral to an effective ministry and in those perceiving that role to be less integral.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5868.

Cross Cultural Comparison

8847. Kilbride, Janet E., Robbins, Michael C., & Kilbride, Philip L. (U. Missouri) **The comparative motor development of Baganda, American white, and American black infants.** *American Anthropologist*, 1970(Dec), Vol. 72(6), 1422-1428.—Examined the developmental motor quotients (DMQs) of 71 male and 92 female 1-24 mo. old rural Baganda infants. Ss were found to be significantly more advanced in motor development in the 1st yr. of life when compared to the sample of white and black American children studied by N. Bayley (see PA, Vol. 39:11902). Although the Ss were not as precocious as M. Geber's sample of Uganda infants, the same downward trend in degree of motor development during the 2nd yr. of life was found. As age increased, DMQ decreased, but at the age of 24 mo., Ss still obtained an average DMQ higher than either American sample. Several interpretations of these results are considered. (26 ref.)—*Journal abstract*.

8848. Martin, William A. (Victoria U., Wellington, New Zealand) **Word-fluency: Intellect or personality?** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 17-24.—65 European and 62 Maori high school Ss were subjected to a battery of tests which included Thurstone's Word Fluency Test. Maori superiority in word fluency production was found not to rest upon a

personality factor (surgency), but to derive from definite word fluency ability. Of the 8 factors derived from the data, only 7 were applicable to the Maori, including a verbally biased intelligence factor, 2 personality factors, and 2 fluency factors. A "missing link" factor applied to Europeans only. There was some evidence which suggested that there was incompatibility between the Maoris' level of intellectual differentiation, on the 1 hand, and their relatively high "g" ratings, on the other.—*Author abstract*.

8849. Munroe, Robert L. & Munroe, Ruth H. (Pitzer Coll.) **Male pregnancy symptoms and cross-sex identity in three societies.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 11-25.—Investigated the correlates of husband's symptoms during wife's pregnancy in 3 societies—American, Black Carib, and Logoli. Men who experienced symptoms generally gave female-like responses on covert measures of sex identity and hyper-masculine responses on overt measures. The hyper-masculine responses were interpreted as attempts to deal with an underlying cross-sex identity. In 2 societies—American and Black Carib—male symptomatology was associated with father absence or adult male absence during the 1st 10 yr. of life. (28 ref.)—*Author abstract*.

8850. Nerlove, Sara B., Munroe, Ruth H., & Munroe, Robert L. (U. California, School of Social Sciences, Irvine) **Effect of environmental experience on spatial ability: A replication.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 3-10.—This cross-cultural study with 13 Kenya Gusii age-matched, boy-girl pairs and 13 cross-cultural age-matched, boy-girl pairs of Kenya Gusii and Kenya Logoli children, 5-8 yr. old, is a replication of an earlier finding (see R. L. Munroe & R. H. Munroe, PA, Vol. 45:7927) among the Logoli. The results showed that Gusii males were more distant from home than Gusii females ($p = .01$); those Gusii children more distant from home were superior on spatial tasks to those children less distant from home ($p = .01$ for copying block patterns and for copying geometric figures; $p = .02$ for the Arthur revision of the Porteus Mazes); the cross-cultural pairs showed the same sex difference in distance from home, i.e., males were more distant irrespective of cultural affiliation ($p = .01$); and within the cross-cultural pairs those children more distant from home were superior on spatial tasks ($p = .06$ for copying block patterns, and $p = .03$ for copying geometric figures).—*Author abstract*.

Family

8851. Ancona, Leonardo. (Catholic U. of the Sacred Heart, Milan, Italy) **La psicologia dell'amore coniugale.** [Psychology of conjugal love.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 113-128.—Matrimonial bliss rests upon a delicate equilibrium of affectivity and reason. Such a balance needs to be continuously maintained, nourished, and reconquered.—L. L'Abate.

8852. Arasteh, Josephine D. (National Inst. of Mental Health, Bethesda, Md.) **Parenthood: Some antecedents and consequences: A review of the mental health literature.** *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 179-202.—This preliminary survey of the mental health literature discusses both the "antecedents" and "consequences" of parenthood. Under the former heading are grouped such topics as: (a) sex attitudes, knowledge of contraceptive information

and birth control programs to impart such knowledge effectively; (b) "unwanted" conceptions in terms of illegitimacy and abortion; (c) sterilization; and (d) family counseling. If conception is allowed to take place and a child is born, a vast and intricate network of family dynamics gradually emerges. Of relevance here are: (a) the effect of family size and spacing ("density") on the child and his parents, and (b) the ordinal position and sex of the child. (104 ref.)—*Author abstract.*

8853. Bragg, Barry W. & Allen, Vernon L. (U. Toronto, Ontario, Canada) **Ordinal position and conformity: A role theory analysis.** *Sociometry*, 1970(Dec), Vol. 33(4), 371-381.—Applied role theory to the problem of birth order and conformity to a same-sex peer group. 73 male and female undergraduates from 2-sibling families were studied. Results show highest conformity for later-born females with a same-sex sibling, and least for later-born males with a same-sex sibling. An intermediate level of conformity was exhibited by later-born Ss having cross-sex siblings. In the case of 1st-borns, no difference in conformity occurred as a function of sex of their sibling. The pattern of results for conformity is congruent with predictions made from role theory. (20 ref.)—*Journal abstract.*

8854. Havassy-de Avila, Barbara. (Whitby Psychiatric Hosp., Ontario, Canada) **A critical review of the approach to birth order research.** *Canadian Psychologist*, 1971(Apr), Vol. 12(2), 282-305.—Reviewed the birth order literature to demonstrate that the present emphasis on birth order differences with a deemphasis on theory has resulted in confusion. Birth order research topics reviewed were: child-rearing practices; affiliation, dependence, and conformity; intelligence and achievement; and alcoholism. 2 suggestions are made concerning the direction of future birth order research: (a) the importance of theoretically-derived research as opposed to research focused on differences, and (b) the value of a moderator variable. (French abstract) (55 ref.)—*Journal abstract.*

8855. Hedri, A. (53 Bächlerstr., Zurich, Switzerland) **Wohstands-Ehekrisen.** [Marital crises in prosperous families.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1971(Jan), Vol. 21(1), 35-38.—Describes a syndrome of marital crises in relatively financially prosperous families. 1,350 married couples (seeking divorces) were investigated between 1960 and 1961 for sources of marital conflict. Results show that 49% attributed character clashes as sources; 35%, infidelity; 20%, alcoholism; 18%, financial difficulties; 16.5%, sexual problems; and 13.5%, miscellaneous difficulties. Illustrative cases are presented to substantiate statistics. —B. A. Stanton.

8856. Mundigo, Axel. (Cornell U., International Population Program) **Scarcity and family planning in Honduras.** *Cornell Journal of Social Relations*, 1970(Fal), Vol. 5(2), 102-118.—Presents a case for the usefulness of the concept of scarcity which, differing from poverty, extends beyond the economic characteristics of the environment to include social-psychologically scarce resources. Data from a fertility and family planning survey conducted in Honduras to demonstrate the scarcer the resources—as measured by both material and sociopsychological indicators—the more difficult it is to plan not only the children a family wants to have, but also any other activity involving distant goals. Honduras has had an official family planning program since 1965, and the Family Planning Association dates from 1962.

While the total population is 2½ million, 50% of its population is less than 15 yr. of age. Declining mortality and high fertility have made the rate of population growth soar to 3.4% per year, among the highest in the hemisphere.—J. DiGiovanni.

8857. O'Keefe, Garrett J. (U. Wisconsin) **Family communication orientations and interpersonal agreement, accuracy and congruency.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6161.

8858. Okel, Edward. (Ohio State U.) **Modes of resolving differences as a function of marital relatedness and need for approval.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5632-5633.

8859. Smith, Robert C. (U. California, Irvine) **Verbal discussion versus note passing tasks in the study of family role structure.** *Journal of Nervous & Mental Disease*, 1971(Mar), Vol. 152(3), 173-183.—Compared 2 methods of eliciting family interaction: verbal discussion (discussion tasks) and note passing in a communication network (communication network tasks). A small sample of white, middle-class families consisting of mother, father, and adolescent child performed 8 tasks in which they had to reach a single final decision on family relevant problems. Analysis of data showed that the communication network medium yielded (a) a significantly more equal influence and equal communication family role structure, (b) an influence structure which was more unusual or less expected than the role structure on discussion tasks, and (c) an influence structure which correlated significantly less well with the competence structure perceived by all family members. These results support the contention that the communication network cannot be substituted for the representation of role structure obtained from verbal discussion tasks (20 ref.)—*Journal abstract.*

Social Change & Social Programs

8860. Born, David O. (Southern Illinois U.) **Psychological adaptation and development under acculturative stress: Toward a general model.** *Social Science & Medicine*, 1970(Apr), Vol. 3(4), 529-547.

—Examined psychological stresses affecting individuals from tradition-oriented societies who are subjected to acculturative pressures from Western, modernized societies. A cognitive construct, the *mazeway*, was used as a psychological frame-of-reference because of its adaptability to several sociocultural approaches to behavior theory. Primary stress is seen to derive from relative deprivation and, in particular, withdrawal of status respect. Adaptation to socially-induced stress approximates 4 modes: retreatism, reconciliation, innovation, and withdrawal. Innovation and withdrawal are seen to be improbable in the tradition-oriented society. Both retreatism and reconciliation can lead to successful psychocultural adaptation. Several case studies lend support to this theoretical framework (French Spanish, & German summaries) (70 ref.)—*Journal abstract.*

8861. Ehrenberg, Miriam. (New School for Social Research) **Attitudinal and personality differences between entrepreneurial and bureaucratic men.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5517-5518.

8864. Sawyer, Jack. (Northwestern U.) **Relative deprivation: A politically-biased concept?** *Psychiatry*, Washington, D.C., 1971(1 Feb), Vol. 34(1), 91-99. Considers "relative deprivation" as used by F. J. Crawford and M. Naditch (see PA, Vol. 45, 8061) to be a biased use of a concept and because it "fits with the competitive orientation of the dominant institutions of our society it does not readily appear as a bias."—E. M. Upchurch.

SEXUAL BEHAVIOR

8865. Jesser, Clinton J. (Northern Illinois U.) **Reflections on breast attention.** *Journal of Sex Research*, 1971(1 Feb), Vol. 7(1), 13-25. Outlines the psychoanalytic, phylogenetic and sociocultural approaches to breast attention. Psychoanalysis treats breast attention as a consequence of events occurring at the oral stage of infancy, as a consequence of sexual and/or authority problems with mothers, or as a manifestation of interest in survival. The phylogenetic approach deals with the preconditions to sexual attraction and sexual involvement at the nonhuman level. The sociocultural approach treats breast attention in the context of social controls and sex-learning patterns. (2* ref.)—E. B. Juffa.

8866. Kaats, Gilbert R. & Davis, Keith E. (U.S. Air Force Academy) **Effects of volunteer biases in studies of sexual behavior and attitudes.** *Journal of Sex Research*, 1971(1 Feb), Vol. 7(1), 26-34. Attempted to determine whether or not individuals who are willing to report their sexual behavior and attitudes are significantly different from those who will not report such behavior. An extensive questionnaire including 24 items from Reiss' scales of sexual standards was administered to 1 control group consisting of 84 males and 97 females, a "voluntary selection" group of 26 males and 65 females, and a "voluntary completion" group of 155 males and 222 females. With respect to Ss who selectively completed the self-report sexual behavior and attitudes questionnaire, the data do not support the conclusion that volunteers are different from nonvolunteers. As compared to nonvolunteers, volunteers who took the effort of going to the research site reported more liberal sexual attitudes, had more noncoital experience, but were not different with respect to premarital coital rites. It is concluded that changes in sexual behavior are not merely a reflection of changes in reporting.—E. B. Juffa.

ATTITUDES & OPINIONS

8869. Baer, Daniel J. & Mosele, Victor F. (Boston

Coll.) **Political and religious beliefs of Catholics and attitude toward involvement in the Vietnam war.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 16-24. For a sample of 688 adult Catholics, significant associations were found between a Likert-type statement concerning support of American commitment in Vietnam and their political and religious beliefs. Ss who favored involvement in Vietnam more likely felt that the country should be independent from government control, that local tax revenues should remain within the local community, and rejected the suggestion of forming a common market with Europe. With regard to religious beliefs, supporters of official American policy less likely felt that clergy should marry, that fasting laws of the church should be relaxed, or that contemplative religious orders are no longer needed. It appears that acceptance of religious freedom as is related to conservative political views.—Journal summary.

8870. Blank, Esther P. & Aronson, Sidney J. (Johns Hopkins U.) **Effects of previous order and proportion of similar attitude statements on attraction during a subsequent series of dissimilar statements.** *Psychological Science*, 1971(1 Feb), Vol. 22(4), 245-246. "Under conditions in which groups received completed attitude questionnaires of 'strangers,' which were filled out by E in accordance with the Ss' responses to an initial questionnaire. Order and proportion of similar attitude statements for the 1st 12 statements were varied, and the effects of these variations were measured during the presentations of the subsequent 12 dissimilar statements, using a continuous mode of responding. Previous exposure to different orders and proportions had no effect on later responses. Regardless of previous experiences, different groups responded with similar strength of attraction when exposed to blocks of dissimilar or all dissimilar attitude statements."—Journal abstract.

8871. Blizard, Peter J. (Victoria U., Wellington, New Zealand) **The social rejection of the alcoholic and the mentally ill in New Zealand.** *Social Science & Medicine*, 1970(Dec), Vol. 4(5), 513-525. Interviewed a representative urban sample of 263 Ss on their attitudes toward the mentally ill and alcoholics. Ss completed the Social Distance Scale after reading each of 5 case histories describing a normal person, a compulsive neurotic, a simple schizophrenic, an alcoholic, and a paranoid schizophrenic. Results indicate that (a) attitudes were closely related to the extent to which behavior departed from "normal," (b) age and educational status of respondents was unrelated to attitudes, and (c) previous contact with mental illness and authoritarianism were significantly related to attitudes. It is concluded that social judgments and rejection of the mentally ill are based on moral-normative criteria. (French & German summaries) (35 ref.)—Journal abstract.

8872. Cauthen, Nelson R., Robinson, Ira E., & Krauss, Herbert H. (Veterans Administration Hosp., New Orleans, La.) **Stereotypes: A review of the literature 1926-1968.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 103-125. Stereotypes are conceptualized as models of the world guiding behavior. The literature on minority group stereotypes is discussed in the framework of 5 dimensions: content, uniformity, direction, intensity, and familiarity. Stereotypes are regarded as linguistic models guiding the expression of prejudice. Several illustrations of stereotypes guiding behavior are offered.

A brief theoretical sketch of stereotypes as linguistic behavior is presented. (95 ref.)—*Author abstract.*

8873. Crosby, Richard W. (Canadian Facts Co., Toronto, Ontario.) **Attitude measurement in a bilingual culture.** *Journal of Marketing Research*, 1969(Nov), Vol. 6(4), 421-426.—In order to determine whether French-English measured differences in attitude were a function of the scaling devices used, 2 experiments were conducted. Results from bipolar (balanced) scales showed more French-English agreement than unipolar (unbalanced). Subsequently, the concept of target-hit-accuracy was judged using bipolar (balanced) positively and negatively loaded and numerical scales; results showed no French-English differences.—*J. C. Franklin.*

8874. Dawson, William E. & Brinker, Richard P. (U. Notre Dame) **Validation of ratio scales of opinion by multimodality matching.** *Perception & Psychophysics*, 1971(May), Vol. 9(5), 413-417.—Requested 71 male and 1 female undergraduates, in 3 experiments, to adjust loudness and force of handgrip (and in 1 experiment apparent duration) to match the strength of their opinions regarding racism, occupational desirability, and pronounceability of trigrams. For each stimulus item, median settings of 1 continuum were plotted as a function of median settings of the other. The resulting power-function exponents agree with previous cross-modality matches and with results of a cross-modality match of loudness and duration produced by Ss in the present experiments. Results provide validation of ratio scales of opinion and further establish the direct scaling methods used to obtain them.—*Journal abstract.*

8876. Feinberg, Lawrence B. (Syracuse U.) **Nonimmediacy in verbal communication as an indicator of attitudes toward the disabled.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 135-140.—Relatively unstructured statements about disabled and nondisabled persons, obtained from 25 undergraduate students, were analyzed for nonimmediacy and correlated with scores on the Attitude Toward Disabled Persons Test. Results revealed a significant inverse relationship between measured attitudes toward the disabled and the degree of nonimmediacy in communications about the disabled. Statements about the disabled contained significantly more nonimmediacy than statements about the nondisabled among Ss with low (negative) measured attitudes toward the disabled.—*Author abstract.*

8877. Gillmore, Gerald M. (Michigan State U.) **Legalism, antinomianism, situationalism: Three moral decision-making orientations.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6158.

8878. Larsen, Knud S. (Oregon State U.) **Affectivity, cognitive style, and social judgment.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 119-123.—Investigated whether cognitive style contributes to item displacement using the Thurstone method of equal-appearing intervals. 263 undergraduates rated 121 statements on each of 3 issues (communism, liquor by the drink, and TV), representing a gradient of affectivity from highly intense to neutral. The predictor variables were cognitive complexity and dogmatism. For cognitive complexity, the overall results were not significant. Dogmatism was relatively independent of affectivity,

and highly dogmatic Ss consistently displaced more items into the extreme categories across all 3 issues, including the neutral issue. Results suggest that a cognitive style, independent of any affectivity dimension, may contribute to item displacement and to distortion of social judgment. (22 ref.)—*Journal abstract.*

8879. Lawson, E. D. (State University Coll. New York, Fredonia) **Semantic differential analysis of men's first names.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 229-240.—To investigate stereotypes associated with men's 1st names, 180 Ss completed semantic differential scales. In Exp. I, 50 men and 50 women rated common 1st names. In Exp. II, 40 men and 40 women rated a sample of common and random men's 1st names. Significance tests show the relationship of names to concepts assumed to measure the evaluative, potency, and activity factors. 3-dimensional models constructed for both studies show the relative positioning of names. Results indicate: (a) confirmation of the existence of stereotypes, (b) positive evaluation of common names, and (c) general agreement on evaluation of names by men and women. (17 ref.) *Journal summary.*

8880. Mack, Jeanne. (Texas Woman's U.) **The dating and rating preferences of a group of male and female college students.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5519. **Dating & rating preferences, popularity & characterization of prospective marriage partner, college students.**

8881. Ofshe, Richard & Ofshe, Lynne. (U. California, Berkeley) **A comparative study of two scaling models: Paired comparisons and scalogram analysis.** *Sociometry*, 1970(Dec), Vol. 33(4), 409-426.—Reports the results of a study in which the same set of attitude statements were scaled with paired comparisons and scalogram procedures, which theoretically, should produce identical rank orders. Data from 4 independent samples of a total of 209 undergraduates were scaled using both models. Resulting paired comparisons and scalogram estimates of the rank orders of the statements correlated with values of .24, +.14, =.14, and .05. When the attitudes were measured and the respondents ranked with respect to the strength of their attitudes, the rank orders correlated with values of .14, =.06, +.13, and +.13. Data are presented which suggest that the scalogram procedure produced the incorrect results. A tentative explanation for the different results is reported. (30 ref.)—*Journal abstract.*

8882. Rambo, William W. (Oklahoma State U.) **Attitude measurement: The problem of predictability.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 43-48. **Attitude scale construction techniques give, at best, only indirect attention to the prediction capabilities of individual items. Although conventional scaling procedures can be augmented by an item analysis sequence that uses known-affiliation groups, many uncertainties surround this approach. Laboratory analogues of the social processes central to a scale are recommended as a source of data for item analysis. The group autokinetic experiment is suggested as an example of a laboratory analogue of the social processes central to a scale intended to measure attitudes toward dissent.**—*Journal abstract.*

8883. Reich, John W. & Moody, Carl A. (Arizona State U.) **Stimulus properties, frequency of exposure, and affective responding.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 27-35.—Investigated several variables which might be useful in explaining the

and used to guide the study of both collective and noncollective behavior transactions. It is concluded that the dimensions of associations specify both the nature and degree of bondness present between participants. (29 ref.)—*Journal abstract.*

8912. Criddle, William D. (U. British Columbia, Vancouver, Canada) **The physical presence of other individuals as a factor in social facilitation.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 229-230.—Attempted (a) to establish whether or not the physical presence of other individuals is a necessary condition for the occurrence of social facilitation in humans, and (b) to examine the drive hypothesis of social facilitation using 60 female nursing students. Ss learned competitive or noncompetitive lists of paired associates while alone or while observed from behind a 1-way screen. Analysis of the competitive list data suggest that dominant responses were enhanced at the expense of subordinate responses when Ss were observed through a 1-way screen. No affect attributable to observation was found in the noncompetitive list data.—*Journal abstract.*

8916. Fiedler, Fred E. (U. Washington) **Note on the methodology of the Graen, Orris, and Alvares studies testing the contingency model.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 202-204.—Discusses some methodological shortcomings of the study by G. Graen, J. Orris, and K. Alvares (see PA, Vol. 46:Issue 4) on the contingency model. The critique points out that (a) the position power manipulation was probably ineffective and at best very weak; (b) differences between supposedly structured and unstructured tasks were unnecessarily small, especially since other tasks were readily available; and (c) an analysis of variance of leader Least Preferred Co-worker (LPC) scores yielded a highly significant F ratio indicating that some octants in the 2nd study contained primarily high LPC leaders while others contained primarily low LPC leaders. In view of their methodological inadequacies, it is concluded that the experiments did not constitute an adequate test of the contingency model.—*Journal abstract.*

8918. Frank, Frederic & Anderson, Lynn R. (Bowling Green State U.) **Effects of task and group size upon group productivity and member satisfaction.** *Sociometry*, 1971(Mar), Vol. 34(1), 135-149.—Tested I. Steiner's (see PA, Vol. 40:10588) model for predicting the interaction of group size and task type. 144 male and 144 female undergraduates were assigned to same-sex groups of 2, 3, 5, or 8 persons and worked conjunctive or disjunctive tasks. Results show that increases in group size (a) enhanced quantitative performance of disjunctive tasks where performance was a function of the most

competent member, and (b) were detrimental to performance on conjunctive tasks where performance was a function of the poorest member. The same Size \times Task interaction was found in ratings of the tasks for pleasantness and enjoyment. Other satisfaction and group atmosphere ratings show main effects due to task type and group size, with disjunctive tasks and odd-size groups producing more satisfaction.—*Journal abstract.*

8919. Gallo, Philip & Sheposh, John. (San Diego State Coll.) **Effects of incentive magnitude on cooperation in the Prisoner's Dilemma game: A reply to Gumpert, Deutsch, and Epstein.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 42-46.—Attempted to isolate the variables responsible for the finding by P. Gumpert, M. Deutsch, and Y. Epstein (see PA, Vol. 43:8275) that Ss played the Prisoner's Dilemma game more cooperatively when imaginary money rather than real money was used. In Exp. I, 60 male and 60 female undergraduates were assigned to 1 of 3 groups: (a) imaginary money, (b) initial payment and imaginary money, and (c) real money. The instructions were modified in Exp. II with 40 male and 40 female undergraduates. In both studies, Ss playing for real money were more cooperative than those playing for imaginary money, but the differences did not reach significance. A combined analysis did yield a significant difference in favor of real money. It is suggested that the relationship between real money and cooperative behavior is a highly complex function of a number of variables.—*Journal abstract.*

8922. Graen, George; Orris, James B., & Alvares, Kenneth M. (U. Illinois) **Contingency model of leadership effectiveness: Some experimental results.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 196-201. Conducted 2 parallel experiments with 78 and 96 undergraduates to replicate and further study the contingency model of leadership effectiveness proposed by F. Fiedler. Ss were assigned to 3-man groups and completed a high and a low structured task after selecting a leader. Ss completed a measure of leadership style, the Least Preferred Co-worker (LPC) scale, a group atmosphere scale, and a leader behavior scale. None of the observed correlations for either study reached significance, and in Exp. II, only 2 of the 7 correlations were in the hypothesized direction. Results along with those of other studies are discussed as casting doubt on the plausibility of the contingency model.—*Journal abstract.*

8923. Graen, George; Orris, James B., & Alvares, Kenneth M. (U. Illinois) **Contingency model of leadership effectiveness: Some methodological issues.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 205-210.—Discusses a number of methodological issues raised by F. Fiedler (see PA, Vol. 46:Issue 4) concerning empirical studies designed to test several hypotheses derived from his contingency model of leadership effectiveness. A number of recommendations are suggested to enhance the information-producing value of

future studies designed to test these hypotheses.—*Journal abstract*

8924. Hackman, J. Richard & Vidmar, Neil (Yale U.) **Effects of size and task type on group performance and member reactions.** *Symmetry* 1978(Mar), Vol. 33(1): 31-54. Assessed the effects of group size (2-7 members) and certain task characteristics (production, discussion, and problem solving) on group performance and member reactions. 162 male undergraduates from each of 2 universities performed 3 15-min tasks. Results show that (a) size had negligible effects on performance characteristics and strong effects on member reactions; (b) dyads tended to be most satisfied and dissatisfaction increased in approximately linear fashion for larger groups; (c) type of task strongly affected both performance characteristics and member reactions; and (d) there were no substantial interactions between size and task type in predicting member reactions or group performance. Results are discussed in terms of (a) the uniqueness of dyads in comparison to other groups sizes; (b) the question of "optimal" group size; (c) the means by which the strong effects of task type may take place; and (d) questions raised by the finding that some substantial differences were obtained for Ss from the 2 different universities. (20 ref.)—*Journal abstract*

8925. Harrison, Roger. (Development Research Assoc. Cambridge, Mass.) **Research on human relations training: Design and interpretation.** *Journal of Applied Behavioral Science* 1971(Jan), Vol. 7(1): 71-85. Presents a review of the methodological problems involved in planning and conducting research on changes in interpersonal behavior as a function of the teaching-learning process. The article is directed to both creators and consumers of research on human relations training. (16 ref.)—*D. Jewell*

8926. Hewitt, Jay. (U. Missouri, Kansas City) **Interpersonal attraction as a function of the type of favorable and unfavorable evaluation.** *Psychonomic Science* 1971(Feb), Vol. 22(4): 197-198. In an experiment with 30 male undergraduates, Ss received personal evaluations from 3 confederates and then rated their liking for each individual. Favorable evaluations produced more attraction than unfavorable evaluations regardless of whether they were consistent or inconsistent with S's perception of himself. The specific content of the evaluation was more important when the evaluation was unfavorable than when it was favorable. Different types of favorable evaluation were not associated with differential degrees of liking. Unfavorable evaluations that were inconsistent with S's perception of himself produced greater hostility than those that were consistent with S's perception of himself.—*Journal abstract*

8927. Horai, Joann. (U. Miami) **The attribution of intent and the norm of reciprocity under dyadic conflict.** *Dissertation Abstracts International* 1971(Mar), Vol. 31(9-B): 5664.

8928. Kahan, James P. & Pichevin, Marie F. (U. Southern California) **Free-choice dissonance: An interpersonal simulation.** *Representative Research in Social Psychology* 1971(Jan), Vol. 2(1): 11-20. Prepared a videotape in which a French translation of J. W. Brehm's (see PA, Vol. 31:4251) free-choice cognitive dissonance experiment was acted out. This tape in high school to 54 undergraduate women, who were asked to predict the S's final responses to a desirability ques-

tionnaire. Following D. J. Bem (see PA, Vol. 41:1358-), was predicted that the Os would successfully predict the responses and show an awareness of the effects of dissonance. Results indicate that there were no differences in the judgments between dissonance conditions. Some trends over all Ss are examined.—*Journal abstract*

8929. Lane, Irving M., Messé, Lawrence A., & Phillips, James I. (Louisiana State U.) **Differential inputs as a determinant in the selection of a distributor of rewards.** *Psychonomic Science* 1971(Feb), Vol. 24(1): 25-29. Investigated perceived differences in the belief that others will allocate rewards equitably in an experiment with 60 male undergraduates. Results indicate that Ss incorrectly perceived that individuals with inputs that were both the highest and most similar to their own would be the most equitable in their allocation of distributors tended to allocate rewards equitably regardless of their own inputs.—*Journal abstract*

8930. Levinger, George; Senn, David J., & Jorgensen, Bruce W. (U. Massachusetts) **Progress toward permanence in courtship: A test of the Kerckhoff-Davis hypotheses.** *Symmetry* 1978(Dec), Vol. 33(4): 427-431. Attempted to replicate and extend the study of A. Kerckhoff and K. Davis (see PA, Vol. 37:1536) on the effects of value consensus and need complementarity on mate selection. Samples of 330 "steadily attached" couples from 2 state universities reported on their courtship relationships in both the fall (Time) and the spring (Time) of the school year. Previous findings, that value consensus and need complementarity would enhance progress toward permanence, received only marginal support. Additional analyses of other Time paper-and-pencil compatibility indices also failed to relate substantially to the Time changes. The best predictors were the partners' own Time feelings about their relationship. It is suggested that there are 2 supplementary processes involved in deep-going relationships: (a) member similarity governing the manner partners discover one another, and (b) pair communality, determining the development of the relationship. (19 ref.)—*Journal abstract*

8931. Lindskold, Svann & Tedeschi, James T. (Ohio U.) **Reward power and attraction in interpersonal conflict.** *Psychonomic Science* 1971(Feb), Vol. 22(4): 211-213. 72 male and 72 female undergraduates played a Prisoner's Dilemma game, modified to include occasional promises to the S stating that he would be given extra points if he cooperated on the next trial. The probability and magnitude of promised reward and the overall cooperativeness of the promisor were manipulated. Females cooperated more and evaluated the promisor more favorably than did males. It is concluded that the norm of reciprocity overrode the effects of the manipulations on compliance for the reason that the promisor was unconditionally accommodative on the promise trials. An indirect relationship between ratings of the promisor's potency and his rewardingness was obtained. (18 ref.)—*Journal abstract*

8932. Luszki, Walter A. (165 Maple St., Charleston, S.C.) **Psych yourself to better tennis.** Hollywood Calif. Creative Editorial Service, 1971. xiii, 148 p. \$3.50 (paper). Discusses the psychology of tennis from 7 aspects: ego, emotional, and interpersonal relations. Ego aspects are discussed from the viewpoints of using your IQ, concentration and distractions, foreknowledge

psychological warfare, and behavior modification. Emotional aspects, from the viewpoints of love and kill in tennis, Freud on the tennis court, controlling jitters in tournament tennis, and magical thinking in tennis. The interpersonal relations are covered under social psychological aspects in tennis. Psychological principles are applied to tennis. The book's intent is to guide players from "public-parks players" to the career tournament player. Illustrations of principles are drawn from the author's experience and from observations and comments of many of the world's best tennis players.
—Author abstract.

8933. Mackenzie, Kenneth D. (U. Waterloo, Ontario, Canada) **An analysis of risky shift experiments. *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 283-303.** Analyzed risky shift experiments, including the decision problem, the concept of risk employed, contending hypotheses, and statistical deficiencies. The Wallach-Kogan choice dilemma instrument used in most experiments on group risk taking has 12 questions. Each question has a status quo or sure thing with a utility U_1 and a risky alternative which, if successful, yields a utility of U_1 and if unsuccessful, a disutility of $-U_2$. Allowing for possible utilities for gambling or risk-taking and caution, an expected utility function for taking the risky alternative can be formed. Ss' task of determining the minimum probability for accepting the risky alternative is the solution of the utility function for p . This solution and its changes in value have infinitely many possible explanations. The concept of risk used in such experiments is shown to be questionable. Analysis of current explanations of risky shift demonstrates that these explanations are not testable using the Wallach-Kogan questionnaire. Suggestions are made to reformulate the research problem. (63 ref.)—*Journal abstract*.

8934. Mascaro, Guillermo F. (U. Florida) **Interpersonal attraction and uncertainty reduction as functions of judgmental similarity. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 71-75.**—Tested the effects of 3 levels of judgmental similarity on evaluative attraction and on uncertainty reduction. 36 male undergraduates served as Ss. A significant increase in evaluative attraction and a nonsignificant increase in certainty were found, as similarity in quantitative (error-choice type) judgments increased. Findings extend the generality of the similarity-attraction hypothesis and suggest limited support for the effectance-reduction hypothesis. (15 ref.)—*Journal abstract*.

8935. McDaniel, James W., O'Neal, Edgar, & Fox, Ellen S. (Adrian Coll.) **Magnitude of retaliation as a function of the similarity of available responses to those employed by attacker. *Psychonomic Science*, 1971(Feb), Vol. 22(4), 215-217.**—Under the guise of a stress and problem-solving experiment, 56 male undergraduates in a $2 \times 2 \times 2$ factorial design were given either electric shocks or a negative point rating at 1 of 2 levels (control or attack). Ss were then allowed to retaliate with electric shock or a negative point rating. As predicted, retaliation was greater under the attack condition. Ss in the attack condition who were allowed to respond in the same manner by which they were attacked retaliated more than Ss responding in the different mode. Results are interpreted in terms of their implications for the frustration-aggression hypothesis.
—*Journal abstract*.

8936. Mezei, Louis. (U. Detroit) **Perceived social**

pressure as an explanation of shifts in the relative influence of race and belief on prejudice across social interactions. *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 69-81. Measured the degree of acceptance and rejection of 4 stimulus persons, varying in race and belief, for 10 social interactions. 131 white and 28 black male and female undergraduates served as Ss. The race of the stimulus persons was black or white, and the beliefs used were pro- or anticomunism or strong civil rights legislation. For the 2 beliefs combined, race prejudice was significantly higher than belief prejudice for marriage, dating, and accepting as kin. For 6 interactions, belief prejudice was higher than race prejudice. Perceived social pressure to race prejudice was significantly higher than to belief prejudice for the interactions for which race prejudice was higher than belief prejudice. Adjustment of both race and belief prejudice scores for the operation of perceived social pressure resulted in the reversal of the observed relationship between race and belief prejudice for the 3 intimate interactions. (25 ref.)—*Journal abstract*.

8937. Mills, Judson & O'Neal, Edgar. (U. Missouri) **Anticipated choice, attention, and halo effect. *Psychonomic Science*, 1971(Feb), Vol. 22(4), 231-233.**—Conducted an experiment with 44 male undergraduates to clarify the interpretation of a finding by E. O'Neal and J. Mills that the anticipation of making choices about other persons increases the intercorrelation of traits attributed to those persons. An attention interpretation of their finding assumes that greater attention was paid to the choice stimuli and that increased attention increased the intercorrelation of traits. Although the O'Neal-Mills finding was obtained, no support was found for either of the assumptions of the attention interpretation. Ss did not spend longer ranking the choice stimuli, and a successful manipulation of attention did not increase the intercorrelation of the rankings. It is concluded that a desire for certainty about the prospective choice provides the best explanation of the influence of anticipated choice in the halo effect.—*Journal abstract*.

8941. Patterson, Miles L., Mullens, Sherry, & Romano, Jeanne. (U. Missouri, St. Louis) **Compensatory reactions to spatial intrusion. *Sociometry*, 1971(Mar), Vol. 34(1), 114-121.**—Examined reactions to the "immediacy" of an intruder in a university library. 40 male and 40 female undergraduates seated alone at a study table were selected as targets for intrusion by 1 of the 2 female Es who alternated between the roles of intruder and rater. Approaches to the S involved 4 seated positions: (a) adjacent, (b) across, (c) 2 seats adjacent, and (d) 3 seats adjacent to S. Hypothesized compensatory reactions to increased immediacy were found in leaning and blocking responses, while differences opposite those predicted were found in frequency of cross

glancing. Although few Ss left during the 10-min period of intrusion there was evidence that among those who left the shortest latencies were in the condition of greatest immediacy. *Journal abstract*

8946. **Saks, Stephen M.** (Carnegie-Mellon U.) **Need for stimulation as a factor in social behavior.** *Journal of Personality & Social Psychology*, 1971(Jan), Vol. 19(1), 124-134. Sketches a theory which would account for the findings in recent experiments that (a) Ss classified as "reducers" on the kinaesthetic aftereffects task are particularly likely to seek out and respond favorably to complex, interesting, and intense stimulus situations, and (b) that Ss classified as "augmenters" are particularly likely to seek out and respond favorably to quiet, dull and simple stimulus situations. These differential tendencies are considered to stem from differences among individuals in a putative need for stimulation. 4 experiments with a total of 97 male and 56 female undergraduates were conducted to investigate various ramifications of the theory. Results indicate that individuals high in measured need for stimulation: (a) react favorably to interesting stimuli, (b) attend closely to complex verbal communications, (c) exhibit high levels of activity in a deprived stimulus situation, and (d) show high levels of talking in a group discussion. (35 ref.) *Journal abstract*.

8947. **Shaw, Marvin E. & Breid, George R.** (U. Florida) **Effects of attribution of responsibility for negative events on behavior in small groups.** *Sociometry*, 1970(Dec), Vol. 33(4), 382-393. Examined the effects of attribution of responsibility (AR), sanctioning, and number of accusers on the reactions of others to the accused and on the effectiveness of groups in which the accused holds membership. 168 male undergraduates served as Ss. In Phase 1, 1 team was composed of either 2 or 3 naive Ss, the other of 1 naive S and either 1 or 2 confederates. During the course of the game the confederate(s) accused the naive team member of being responsible for team losses and, under some conditions, sanctioned him for the losses. In Phase 2, the accused and members of the other team (the nonaccused) worked together as members of a problem solving group. Results of Phase 1 demonstrate clearly that AR to a person for negative events induces that person to: (a) view his accusers less favorably, (b) be less satisfied with the performance of his team, and (c) see accusers as having less ability and as being less cooperative. The nonaccused saw the accused and his team in a similar way.

The nonaccused preferred not to work with the accused. The number of Phase 1 had no effect on problem solving effectiveness in Phase 2. *Journal abstract*.

8948. **Shaw, Marvin E. & Breid, George R.** (U. Florida) **Some effects of attribution of responsibility upon the effectiveness of small problem-solving groups.** *Psychological Science*, 1971(Feb), Vol. 22(2), 129-134. Examined the effects of attribution of responsibility for a negative event to 1 member of a group upon the effectiveness of that group. 3 experimental conditions were studied: (a) attribution of responsibility (AR + S) — members of the group were made aware that 1 of them had been accused of passing bad checks and had been sanctioned (given a suspended sentence for it); (b) AR only — members of the group were made aware that 1 of them had been accused of the passing of bad checks (passing bad checks) but was not sanctioned for it (charges were dropped); and (c) control — no information about the negative event. Each group solved 2 problems. Results show that the AR + S condition required the longest time for task completion, the AR only condition an intermediate amount of time, and the control condition, the least amount of time. Findings are interpreted in terms of member acceptance of the accused member was not fully accepted by the group and this rejection interfered with effective group interaction. *Journal abstract*.

8949. **Turney, John R.** (Cornell U.) **The cognitive complexity of group members, group structure, and group effectiveness.** *Cornell Journal of Social Relations*, 1970(Fall), Vol. 5(2), 152-165. Examined the effectiveness of small groups performing a complex information processing task over an extended time period as a function of the cognitive abstractness-concreteness of the group members. Groups having a majority of cognitively abstract members were more effective than groups with a majority of concrete members. Reason for the relative effectiveness of the groups was their ability or inability to establish functional group structures. The relative advantages and disadvantages for group effectiveness of abstract and concrete persons are discussed. 35 members of 8 teams were assigned based on their scores on a sentence-completion test measuring cognitive concreteness-abstractness. The emergent leaders were 2 of the group's abstract members. A heterogeneous abstract-concrete team may be more effective than a homogeneous abstract team in some task situations where there are a number of such highly structured tasks. — *DiGeronimo*

8950. **Vroom, Victor H. & Deci, Edward L.** (Carnegie-Mellon U.) **Leadership, social value, and the risky shift.** *Representative Research in Social Psychology*, 1971(Jan), Vol. 2(1), 33-41. Hypothesized (a) that there is, in general, a correlation between riskiness and esteem and (b) that if high esteem persons within any group are and (b) that if high esteem persons within any group are high esteem people are conservative, there will tend to be a conservative shift. To test this hypothesis, 50 29-33 yr old business executives were divided into groups composed so as to have high positive or high negative correlation between riskiness and esteem. An 8-item version of the Wallach and Kogan Choice Dilemma Task questionnaire and a sociometric questionnaire were given to all Ss. It was predicted that the groups with positive correlation would have a significantly more risky shift than those with negative correlation. Neither hypothesis was supported. However, implications were

found for a "value hypothesis," and 2 formulations are discussed. (17 ref.)—*Journal abstract.*

Edinburgh, Scotland) **We are what we do.** *Papers in Psychology*, 1970(Apr), Vol. 4(1-2), 21-23.—Comments on Goffman's view of the self and of self-interaction and how this view is related to the study of life institutions, demonstrating the truth in the statement that all the world's a stage and we are all in fact players.—S. L. Warren.

8954. Zander, Alvin & Ulberg, Cyrus. (U. Michigan, Research Center for Group Dynamics) **The group level of aspiration and external social pressures.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 362-378.—Describes an experiment with 96 11th grade boys in which the difficulty of an external standard pressed upon a group and the success or failure of the group on its task were made to be independent events. When Ss' usual preference for harder aspiration levels was ruled out, a harder external standard was no more influential than an easier one. Regardless of its difficulty, an external standard was less influential if it was inappropriate to the prior performance of the group or to an S's strength of desire for group success; in such an instance, an S's aspiration for his group was determined by the preference of his teammates. Ss with greater desire for group success set harder aspiration levels and performed better than those with less.—*Journal abstract.*

8955. Zellner, Miriam & Levinger, George. (Hunter Coll., City U. New York) **Liking and self-evaluation: Comfort and respect as sources of attraction.** *Representative Research in Social Psychology*, 1971(Jan), Vol. 2(1), 58-65.—Employed L. Festinger's social comparison theory to qualify the assertion that similarity leads to attraction. It was proposed that such a statement is applicable more to liking relations based on feelings of comfort than on feelings of respect for the liked other. A study conducted with 80 undergraduates confirms this proposal. Nevertheless, for both sorts of liking, similar characteristics of the liked other were considered more attractive and important by respondents than dissimilar characteristics. Implications of these findings are discussed.—*Journal abstract.*

8957. Craig, Kenneth D. & Weiss, Stephen M. (U. Calgary, Alberta, Canada) **Vicarious influences on pain-threshold determinations.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 53-59.—Examined the effects of having models dissimulate different levels of pain susceptibility on Os' pain thresholds. 30 male undergraduates and a confederate model ostensibly received identical electric shocks, increasing from an undetectable level in increments of .5 ma. up to the level at which the S reported pain. Making responses contingent upon the S's ratings, the model either delayed or hastened advances along a 5-point rating scale of the severity of the experience. Observing a model tolerate pain led to pain thresholds more than 3 times greater than the thresholds reported by Ss observing a model who was less tolerant. Findings are discussed in the context of the effects of social influences on pain reports and theories of vicarious experience. (22 ref.)—*Journal abstract.*

8958. De Long, Alton J. (Pennsylvania State U., Coll. of Human Development, Div. of Man-Environment Relations) **Seating position and perceived characteristics of members of a small group.** *Cornell Journal of Social Relations*, 1970(Fal), Vol. 5(2), 134-151.—Considers the perceived characteristics of group members on 8 rating scales as a function of seating position in order to ascertain aspects of the communicative "leading" of seating positions in the group environment. The perceived characteristics of members of a small group, across all rating scales, were directly related to the linear distance between their respective seating positions and the seating position of the recognized leader of the group. Those closer to the leader spatially were rated higher across all scales, while those farther away were rated lower. Seating position, in terms of territorial propinquity to the leader, does possess a considerable range of communication value, the specifics of which are a function of the overriding context. J. DiGiovanni.

8960. Hillmann, Günther. (U. Munich, W. Germany) **Zentralisierte Organisation und Gruppenprozesse.** [Centralized organization and group processes.] *Gruppendynamik*, 1970(Apr), No. 2, 134-154. Because of changes in society, the lives of individuals and groups have taken on new forms. Individuals are more dependent upon groups and groups are more rigidly organized and have lost human aspects. In order to cope with the masses, groups or organizations go through various stages of development in which they are exposed to various forces. Through cooperation organizations may handle their members but need strong centralization. This central organ or management is plagued by demands of members and is the target of unsolvable conflicts. However, management and persons constituting it are different organisms and behave differently. Reasons for this stem from expectations members of organizations have and from the fact that sometimes individuals reach these managerial positions who use it as a "mousehole." Problems of organizations and their members cannot be solved from within and by organizational means. (42 ref.)—M. J. Stanford.

8961. Lapassade, Georges. (U. Tunis, Tunisia) **Von der Gruppendynamik zur institutionellen Analyse.** [From group dynamics to institutional analysis.] *Gruppendynamik*, 1970(Apr), No. 2, 124-133.—Prior to group seminars a structure has been set up constituting the "inner institutional system" which stands in relation to "outer institution" that produced the seminars. Analysis of events has to consider relations between inner and outer institutions. These dimensions are accessible to experience as elements of the seminar situation, have to be analyzed and conveyed by feedback to everybody concerned. This structural analysis as part of the sociopsychological process leads to new modalities for the practice of seminars, i.e., to 2 stages. In Stage 1, there are 2 supplementary groups: (a) the T-group learning group dynamics, and (b) the total group engaging in structural analysis. In Stage 2, participants take totality of the educational organization in their own hands; as a "committee" they become organizers for training. This is designated as a seminar for "autoformation."—M. J. Stanford.

8962. Lewis, Gordon H. (Carnegie-Mellon U., School of Urban & Public Affairs) **Bales' Monte Carlo model of small group discussions.** *Sociometry*, 1970(Mar), Vol. 33(1), 20-36.—Simulated R. F. Bales' Monte Carlo model of group discussions and compared this to data from actual discussions. 5 simulated 5-man groups and 28 real 5-man groups were studied. Comparison shows that the model is inadequate in its attempt to represent the process of act initiation. A fundamental deficiency of the model is considered to be its requirement that the reaction probabilities be equal for all members of a group. (16 ref.) *Journal abstract.*

8963. Reid, David W., & Ware, Edward E. (U. Waterloo, Ontario, Canada) **A factorial study of judgments of vocally expressed emotion and meaning.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 161-162.—Studied the vocal expression of 10 different emotions in content-free speech by 5 encoders to 20 decoders. 3 significant main effects and 2 significant interactions between emotions and encoders, and emotions and decoders were found. No significant relationships were found between S's ratings of the emotions on 12 semantic differential scales and any of the 5 statistically significant effects. *Author abstract.*

8964. Schlenker, Barry R., Bonoma, Thomas; Tedeschi, James T., & Pivnick, William P. (State U. New York, Albany) **Compliance to threats as a function of the wording of the threat and the exploitativeness of the threatener.** *Sociometry*, 1970(Dec), Vol. 33(4), 394-408.—Varied accommodative or exploitative strategies of a simulated source of threats and compellant or deterrent wordings of the threat in a $2 \times 2 \times 2$ orthogonal design. 20 male and 20 female undergraduates participated in a message-modified version of the Prisoner's Dilemma game. Results indicate that when a threatening simulated source was accommodative following the sending of a threat, the target was more compliant to the threat and informed the source of his intention to comply more frequently than when the source employed an exploitative strategy. Results are interpreted in terms of the signaling capacities of threats when followed by subsequent beneficent behavior of the source. Compellant wording of a threat was found to (a) heighten the perception of a hostile and exploitative source, (b) increase compliance to threats, and (c) cause the target to try to deceive the source with statements of intention. Overall, females were more cooperative than

males but in the compellant-exploitative condition they were much less cooperative. (28 ref.)—*Journal abstract.*

8965. Stephenson, Geoffrey M., & Fielding, Geoffrey T. (U. Nottingham, England) **An experimental study of the contagion of leaving behavior in small gatherings.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 81-91.—It is suggested that certain examples of "behavioral contagion" can be interpreted in terms of C. Homans' theory of distributive justice. The action of an initiator may give him an advantage over the other members of the group. Behavioral contagion occurs when the remaining group members seek to nullify the initiator's advantage by following him. Experiments are described which demonstrate behavioral contagion and test the theory in relation to the act of leaving a small coacting group. Deprived groups contagied more than equitably treated groups, and privileged groups contagied least of all, compared with deprived, equity, and privileged control groups of Ss who worked in isolation.—*Author abstract.*

8975. Kaplan, Martin F. (Northern Illinois U.) **Context effects in impression formation: The weighted average versus the meaning-change formulation.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 92-99.—Conducted 2 experiments with a total of 136 undergraduates in which Ss formed impressions of persons described by sets of personality-trait adjectives, and then rated the likeableness of 1 test trait in the set. Test-trait ratings were shifted toward the values of the other traits in the set. This context effect was the same for traits high and low in connotative variability, as predicted by the weighted average model, but contrary to a change-in-meaning hypothesis. Trait credibility and extremity of person-impression ratings directly influenced the magnitude of the context effect in agreement with the weighted average model.—*Journal abstract.*

8976. Koulack, David. (U. Manitoba, Winnipeg, Canada) **Level of aspiration: A function of group scores, sample questions, and anchor distance.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 155-156.—2 studies dealing with the effects of different types of anchors on the level of aspiration were carried out. In Study I (N = 150 undergraduates), it was demonstrated that sample-question difficulty as well as bogus group anchor points play a role in determining the level of aspiration. Study II (N = 61 undergraduates) examined the effect of changing the upper limit of possible scores on the level of aspiration. It was found that increasing the ceiling permitted judgments exceeding bogus group scores.—*Author abstract.*

8978. Miller, Arthur G. (Miami U.) **Social perception of internal-external control.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 103-109. 420 male and 324 female undergraduates were given photographs, previously scaled as being high, moderate, or low in physical attractiveness, and were instructed to fill out Rotter's Internal-External Locus of Control (I-E) Scale as they thought the person in the photograph would. Persons low in attractiveness were perceived as more external in I-E control than persons either high or moderately attractive, there being no difference between the latter. Males perceived females as significantly more external than males, although female Ss did not make this distinction. Results demonstrate the relevance of I-E in interpersonal perception, and in particular the cue value of physical attractiveness in evoking varying perceptions of I-E in a 1st impression setting. (24 ref.)—*Journal abstract.*

8979. Moore, James C. & Krupat, Edward. (York U.,

Toronto, Ontario, Canada) **Relationships between source status, authoritarianism, and conformity in a social influence setting.** *Sociometry*, 1971(Mar), Vol. 34(1), 122-134.—Experimentally confronted 45 male undergraduates, who varied in level of authoritarianism, with disagreements from a "high" or "low" status source on an ambiguous perceptual task. It was found that low authoritarians conformed greatly to the high status source and very little to the low status source while high authoritarians were not differentially susceptible to the 2 sources. The behavior of high authoritarian Ss did not vary as a function of self-esteem, while low authoritarians demonstrated a strong negative relationship between self-esteem and conformity. Results are interpreted as supportive of W. McGuire's analysis of the relationship between authoritarianism and influenceability. It is suggested that in the typical social influence experiment it is important to view the S as an active source rather than simply a passive recipient of information. (29 ref.)—*Journal abstract.*

8980. Porter, Euan; Argyle, Michael, & Salter, Veronica. (Oxford U., Inst. of Experimental Psychology, England) **What is signalled by proximity?** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 39-42. Attempted to determine how proximity is perceived as a cue in dyadic interaction with 54 15-17 yr old boys Ss held conversations with 3 confederates at distances of 2 ft, 4 ft, and 8 ft, and completed 21 7-point rating scales. Proximity did not account for any significant amount of variance in any scale. Confederates were perceived differently after interviews than after informal conversations. Ss did not give more favorable ratings to confederates who sat nearer their own preferred proximity, as determined by the method of limits. It is concluded that while proximity has certain clear determinants, e.g., liking and emotional adjustment, these are not reflected in the way proximity is perceived. *Journal abstract.*

8982. Rosnow, Ralph L., Wainer, Howard, & Arms, Robert L. (Temple U.) **Personality and group impression formation as a function of the amount of overlap in evaluative meaning of the stimulus elements.** *Sociometry*, 1970(Dec), Vol. 33(4), 472-484.—Tested the hypothesis implicit in S. Feldman's set-theoretic model of impression formation that averaging is prepotent when the elements in a stimulus manifold are independent, whereas summation predominates when elements have overlapping meaning. 72 male and 35 female undergraduates made comparative judgments of pairs of individual men or women and of groups of men or women described by sets of correlated or uncorrelated personality trait adjectives. Contrary to Feldman's prediction but consistent with an alternative hypothesis implied by D. Dustin and P. Baldwin (see PA Vol. 40:669), there was increasing evidence of the differential effectiveness of adding as the amount of overlap in meaning of the stimulus elements decreased. No differences in the mode of stimulus integration were attributable to sex differences or personality vs. group impressions. (31 ref.)—*Journal abstract.*

8983. Rule, Brendan G., Haley, Hugh, & McCormack, James. (U. Alberta, Edmonton, Canada) **Anti-Semitism, distraction and physical aggression.** *Canadian Jour-*

Journal of Behavioural Science, 1971(Apr), Vol. 3(2), 174-182. — Examined the aggressive responses of persons who varied in level of anti-Semitism and who were either distracted or not distracted from an insulter. 34 male undergraduates, chosen as Ss through a questionnaire which included the 10-item Anti-Semitism Scale and the 28-item California F Scale, participated in a paired associate learning task in which their performance was determined by a tape recorded series of disparaging remarks presumably given by their peer. Following this critical Ss either relaxed under conditions where voice and movement cues from their insulter were heard, or Ss observed a film designed to distract them from their insulter. The critical Ss were then requested to teach their peer a paired associate list under conditions in which they administered shock to their partner. Results of the $3 \times 2 \times 3$ repeated measures analysis of variance with 3 levels of anti-Semitism, 2 distraction conditions, and 3 levels of shock delivered to the peer. Ss tended to rate themselves as less annoyed and less anxious under distraction conditions. Ss varying in anti-Semitism did not differ in the amount of shock delivered to their partner. The situational demands may have been powerful enough to override the effects of personality differences. 2 interpretations are offered for the finding that the highly prejudiced Ss perceived the shock delivered to their peer as more painful than the less prejudiced Ss: (a) the possibility that this difference reflected the highly prejudiced Ss' lower guilt level for aggressing, and (b) the possibility that the highly prejudiced Ss used different mechanisms to reduce the discomfort engendered by harming another person than those used by their less prejudiced peers. (French summary) (25 ref.)—*Journal abstract*

8984. Sheikh, Anees A. & Miller, Patrick A. (Marquette U.) **Investigation of some variables influencing stereotypy in interpersonal perception.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 213-216. — 3 groups of 26 white Ss each (8th graders, high school seniors, and undergraduate university students) were tested in 2 sessions: (a) they rated 2 black and 2 white individuals, after listening to their interviews and seeing their photographs, on 6 evaluative and 6 nonevaluative semantic differential scales, and (b) 1 wk later they rated "blacks in general" and "whites in general" on the same scales. Results indicate that stereotypy in interpersonal perception did not differ as a function of age. The stereotypy was greater on the evaluative than on the nonevaluative dimensions, and this was more so for the white interviewees than for the black interviewees. —*Author abstract*

8985. Tiberi, Emilio & Maderna, Alessandro M. **Ricerca sugli effetti di un premio in denaro che precede un comportamento di scelta competitiva.** [Research on the effects of a money prize which precedes an action of competitive choice.] *Bollettino di Psicologia Applicata*, 1968, No. 85-87, 3-24. — Studied 2 possible behaviors in competitive situations: (a) the behavior of the person who profits from a privileged condition in terms of wealth and social status, and (b) the behavior of the person who finds himself in the opposite position. 40 Ss were divided into 2 groups. B was the group which was given the advantage and A was at a disadvantage. The inequality was created by means of a money prize given to B in 2 different instances arbitrarily, and as an

earned prize in a test given in the presence of 4 competitors who were incorporated in which no prize was given. It is concluded that (a) B was more competitive than A in the situation where the money prize was earned, (b) A was more competitive than B in the situation where the money prize was arbitrary, and (c) the difference in the competition was equalized.

8986. Wyer, Robert S. (U. Illinois). **The prediction of the evaluation of social role occupants as a function of the favorableness, relevance and probability associated with attributes of these occupants.** *Sociometric Psychology*, Vol. 3(4), 79-96. — Investigated the evaluation of persons occupying various social roles as a function of 3 variables: (a) the subjective probability of the role occupant being evaluated possesses various personal attributes, (b) the favorableness of the attributes, and (c) their relevance to the evaluation of the role. Each variable was defined on the basis of "university students" ratings along a category scale. A partial extension of M. Fishbein's (see PA 68-1076) formulation was used in generating estimates of the favorableness of a role occupant in the absence of specific information about him, and the effects of specific information about the occupant along specific trait dimension. The value of considering the variables in predicting the magnitude of evaluation was demonstrated. *Journal abstract*

COMMUNICATION

8987. Akhmanova, O.S. (Ed.) **Voprosy optimizatsii testestvennykh kommunikativnykh sistem.** [Optimization of natural communicative systems.] Moscow: SSR, Moscow U., 1971. 1 R. 40 K. — Discusses optimization of human communications with the aid of natural language. Changes in language should be carefully deliberated and rules should be simplified. An urgent problem of modern linguistic theory and of theory of communications. General problems of semantics are presented, and characteristics of people's communicative behavior are described. — J. Haller

8988. Cooper, Robert D. (Kent State U.) **A conceptual model and semantic differential technique for semantic communications research.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5195-5195.

8989. DeVito, Joseph A. (Herbert H. Lehman Coll., City U. New York). **Communication: Concepts and processes.** Englewood Cliffs, N.J.: Prentice-Hall, 1970. viii, 231 p. \$8.50 (cloth), \$4.95 (paper).

8990. Dropsy, Jacques & Sheleen, Laura. **Expression corporelle et relations humaines.** [Bodily expression and human relations.] *Bulletin de Psychologie*, 1969-70, Vol. 23(13-16), 750-757. — Discusses the importance of the body and mind being jointly used in communication. Some Oriental conceptualizations of man as a unit are reviewed. Also, presented is the evolution of the author's method of educating toward integration of consciousness of the body in our relations with reality. — J. E. Smith

Problemy sotsial'noi psikhologii i propagandy. [Problems in social psychology and propaganda.] USSR: Politizdat, 1971. 73 K.

8993. **Rubio Dominguez, Jose R. El "rock": Lenguaje de una nueva cultura.** [The "rock": Language of a new culture.] *Revista del Instituto de la Juventud*, 1970(Dec), Vol. 32, 57-84.—Studied rock music in records and festivals. Rebellion and skepticism as reflected in the music of the Beatles are examined. The Rolling Stones' Mick Jagger is considered to be an agitator of masses, sex symbol, and "a great and alarming spectacle." The record is the principal vehicle of expression. The rock record is compared to records of symphonic music and jazz. Bob Dylan's influence is evaluated as "the brain conductor of the new music." The rock style and music festivals are a part of the culture of the young communes, university and intellectual circles, racial minorities, and the artistic vanguard. Rock controls and directs itself. "The human element is now a product of the rock, but not vice versa."—A. M. Farfaglia.

8994. **Sechrest, Lee & Olson, A. Kenneth.** (Northwestern U.) **Graffiti in four types of institutions of higher education.** *Journal of Sex Research*, 1971(Feb), Vol. 7(1), 62-71.—Male toilet wall inscriptions were studied in trade schools, junior colleges, 4-yr colleges, and professional schools. Trade schools had more inscriptions per stall; heterosexual inscriptions had their highest frequency in the trade schools and junior colleges, and the lowest frequency in the 4-yr and professional schools; and hostile comments were more frequent in the trade schools and junior colleges. The inscriptions reflected the directions of preoccupation and interest of the groups involved, and the results were consistent with differences expected on the basis of socioeconomic status.—E. B. Jaffa.

8995. **Spatro, Enzo.** **The role of mass communication in development process.** *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 227-239.—Discusses mass communication in terms of information, theory concepts, economic concepts, and payoffs.—L. L'Abate.

8996. **Weiss, Walter.** (Hunter Coll., City U. New York) **Mass communication.** *Annual Review of Psychology*, 1971, Vol. 22, 309-336.—Reviews literature within a 3-yr period beginning in January 1967 which indicates that "at this time the area of mass communications lacks conceptual coherence and comprises diverse research interests." Discussions include (a) the information function, (b) uses and gratifications of the media, (c) Negroes and the media, (d) violence and the media, (e) diffusion and national development, and (f) political campaigns. (180 ref.)—P. Hertzberg.

Language

8997. ———. **Novoe v lingvistike: VI. Yazykovye kontakty.** [New in linguistics: VI. Language contacts.] USSR: Progress, 1970. 1 R. 90 K.—Analyzes methods used when studying language contacts including sociological aspects of contacts, new methods (also statistical ones), descriptions of various situations, e.g., the bilingual, and recent psycholinguistic investigations of the interference process in bilingualism. Language changes during the process of contacts are described, e.g., the phenomena of borrowing the phonological,

morphological, and syntactical changes of speech structure.—I. Halev.

8998. **Barron, Nancy M.** (U. Missouri) **Grammatical case and sex role: Language differences in interaction.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6155.

8999. **Bourque, Linda B. & Back, Kurt W.** (California State Coll., Los Angeles) **Language, society and subjective experience.** *Sociometry*, 1971(Mar), Vol. 34(1), 1-21.—Considers that the availability of language codes determines the individual's ability and willingness to describe feeling states. Reports of transcendental experiences, for which 2 language codes, religious-mystical and aesthetic, are available in United States' society, were studied. A weighted sample of 3,218 cases based on 1,553 interviews was taken from data collected through a national survey organization. Ss were asked a series of 10 questions on whether they had had a transcendental experience, what had caused it, how frequently they had had such experiences, and whether the experience had affected their lives in any way. Data give tentative confirmation to the hypothesis that the kind of feeling state does not depend on the nature of the experience, but on the person's position in the social structure. (29 ref.)—*Journal abstract.*

(115 ref.)—L. L'Abate.

9005. **Gross, Albert E. & Lohman, Barry M.** (Rutgers State U.) **Attributes of German and English adjectives and nouns.** *Psychonomic Monograph Supplements*, 1970, Vol. 3(15), 243-248.—Reported values for selected attributes of 20 German nouns, 20 German adjectives, and a common English equivalent of each. 40 female undergraduates who were naive in German served as Ss. The attributes are produced meaningfulness, ratings of concreteness, familiarity, imagery, pronounceability, specificity; 4 descriptive constants of distributions of 1st

associations and of 2nd associations, and 3 estimates each of spoken and written frequencies of stimuli and of primacies of 1st and 2nd associations. Relationships among these attributes of words are described across Ss and for meaningfulness and rated attributes, for individual Ss. The relationships are compared with those obtained in other recent extensive assessments of attributes of verbal stimuli. (US ref.)—*Journal abstracts*

9008. Panfilov, V. Z. *Vzaimootnosheniye yazyka i myshleniya*. [Interrelationship of language and thought.] USSR Nauka, 1971. 1 R. 31 K. Examines the relation between the logical forms of thought and the grammatical structure of language. The principle of relative independence of the language was presented, and an original interpretation was given to the theory of sentences. A series of important problems in logic and grammar was investigated.—*J. Hulev*

9009. Perjak, Vid. *Semantičke zavisanosti među pojmovima*. [Semantic dependences between concepts.] *Psichologija*, 1969-1970 (Oct.), Vol. VI(1), 5-13. The network model of concepts shows the interdependence of concepts. In 2 experiments, the following is verified: (a) dependence of internal ties between concepts (i.e., ties between concepts within the conceptual category) on the external ties (i.e., ties between concepts which belong to different conceptual categories) and (b) dependence of external ties between concepts. Generally, results confirm both dependencies which stem from the model. However, in certain cases, there are deviations from the predicted trends. (Russian summary)—*English summary*

9010. Russ, Kenneth L. (U. Pittsburgh). *Prediction of language behavior as a function of induced anxiety in subjects and judges*. *Dissertation Abstracts International*, 1971 (Mar), Vol. 10(9-B), 5639-5640.

9011. Shriberg, Lawrence D. (U. Kansas Medical Center, Kansas City). *Phonetic symbolism in four voiceless fricatives*. *Perceptual & Motor Skills*, 1970 (Feb), Vol. 30(1), 295-299. 48 college students rated 4 voiceless fricatives /f, s, sh, and th/ on 12 bipolar scales of a semantic differential. Analysis of variance revealed significant main effects and significant interaction effects for Sound × Dimension ($p < .001$) and Sound × Scale ($p < .001$). The greater sensitivity of the presumed kinesthetic scales for some sounds suggests that both the scale and the articulatory characteristics of a sound may determine whether ratings reflect primarily denotative or connotative semantic systems.—*Journal abstract*

9012. Smith, Olin W. & Koutstaal, Cornelius W. (Bowling Green State U.). *Some correlates of language distance and their factor structure*. *Perceptual & Motor Skills*, 1970 (Feb), Vol. 30(1), 207-210. 4 studies have yielded 8 variables that are related to J. H. Greenberg and J. J. Jenkins' concept of language distance. These values for each of the 24 CCVCs of Greenberg and Jenkins' List I were correlated. The correlations were subjected to a principal components analysis with a varimax rotation. 3 factors that account for 96% of the variance are reported: (a) the perception and production of speech sounds, (b) language distance, and (c) the effort involved in pronouncing sounds subvocally.—*Journal abstract*

9013. Taylor, Insup. (York U., Toronto, Ontario, Canada). *How are words from two languages organized in bilinguals' memory?* *Canadian Journal of Psychology*, 1971 (Jun), Vol. 25(3), 228-240. 30 English-speaking undergraduates, skilled in French, gave con-

tinuous word associations to equal numbers of French and English key words. The 1st response could be in either language. Thereafter, in 1 experimental condition, Ss could switch languages at will. In the other conditions, Ss were instructed to switch language each time. Rapid switching produced fewer, as compared to slower, free switching resulted in as good performance as unilingual association, perhaps because Ss chose to switch at their natural word organization boundaries. The free switching condition revealed that the probability of switching out of either language was lower than the probability of remaining in the current language, indicating stronger intra- than interlanguage associations. (Summary of French summary)—*Journal abstracts*

9014. Upadhyay, S. N. (Ravishankar U. Raipur, India). *Order of presentation as a factor in the speed of free associative responses*. *Indian Psychology Review*, 1970 (Jan), Vol. 6(2), 88-91. Studied the speed of free associations to 4 types of 20 words each: a frequently used and less frequently used, emotionally charged and uncharged syllables, as a function of the order of presentation using a 4 (List) × 4 (Order) Latin square design. 48 postgraduate boys and girls were divided into 4 groups and were given 1 min to associate freely to as many items in the list as they could. Analysis of results using analysis of variance showed that the items presented first were less frequently responded to in terms of free associative responses. Less frequently used words and uncharged syllables were less promptly associated compared to frequently used and emotionally charged words. The List × Order interaction was not significant.—*K. C. Pandita*

Psycholinguistics

9015. ———. *Semanticheskaya struktura slova*. *Psicholingvistiicheskie issledovaniya*. [The semantic word structure. Psycholinguistic investigations.] USSR Nauka, 1971. 70 K. Considers the problem of the meaningful structure of words. New theoretical principles are presented and a series of new experimental methods for the analysis of meaning are described.

9016. Cromer, Richard F. (Medical Research Council, Developmental Psychology Research Unit, London, England). *In defence of the empirical method: A reply to Broadbent concerning psycholinguistics*. *Bulletin of the British Psychological Society*, 1970 (Oct), Vol. 23(3), 271-279. This article constitutes a rejoinder to an earlier article by D. E. Broadbent who is described as having chosen "the field of psycholinguistics to vent his attack on those he feels to be unempirical." The author admits that many heated arguments have arisen between those who have offered theories that the human mind is innately endowed in some way to acquire language, and those who cannot countenance such notions. Broadbent's views are discussed as well as some of the ongoing studies of language acquisition, after which it is stated that "it is simply untrue to claim that the transformational account of language acquisition plays down the importance of the empirical method."—*J. S. Sexton*

9017. Fillenbaum, Samuel. (U. North Carolina). *Psycholinguistics*. *Annual Review of Psychology*, 1971, Vol. 22, 251-308. Reviews work in psycholinguistics from 1965-1969. The historical background is presented and the relation between linguistic and psychological

formulations discussed. Highlights include (a) biological foundations and the problem of universals (the nativistic thesis and language universals); (b) language acquisition (methodological issues, theoretical perspectives, and semantic and syntactic development); and (c) experimental psycholinguistics (speech perception and phonology, syntax, semantics, the analysis of word meaning, processing strategies, uses of language, and processing in real time). (209 ref.)—*P. Hertzberg*.

9022. Reiter, Henry H. (C. W. Post Coll., Long Island U.) **Some EPPS differences between smokers and non-smokers**. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 253-254.—Reports that 30 smokers and 30 nonsmokers differ significantly on the EPPS in change (Chg), nurturance (Nur), exhibition (Exh), and deference (Def). Smokers scored higher in Chg and Exh while

nonsmokers were higher in Nur and Def. The differences supported previous findings regarding less social responsibility among smokers.—*Journal abstract*.

PERSONALITY

9023. Cammer, Leonard. (110 E. 82nd St., New York, N.Y.) **Personality: A biologic system**. *Conditional Reflex*, 1971(Jan), Vol. 6(1), 52-61.—The personality of man is a biologic system structured on the individual's genetic and anatomic-physiologic potentials for species-specific adaptations. The system also projects him into a social and physical environment. His relationship with this environment is as integral to his being as the unity of his organ parts are to the function of his body. His personality is the end product of all the processes inherent in this biosocial interaction. It is the final statement of his biologic presence on this planet.—*Journal summary*.

9024. Pease, Kenneth. (U. Manchester, England) **The myth of the moral personality**. *Papers in Psychology*, 1970(Apr), Vol. 4(1-2), 16-20. This essay starts with the premise that our judgment of others as moral or immoral is central to our view of them. It then asks why, if morality as a personality trait is so important, psychologists have not recognized it as such by intensive investigation. Examining the history of the study of morality, it is concluded that the reason for disillusionment is the fact that morality is not a useful concept for the psychologist. The only thing that moral behaviors "have in common is the attribution to them of the words good, bad, right or wrong by those who look on." It is pointed out that there is not a personality trait on which defines that a person will act morally in all situations. Morality is, then, a blanket term useless for the scientific analysis of personality. 2 strategies which may be fruitful in the continued study of morality by psychologists are described. (27 ref.)—*S. I. Warren*.

9025. Rosenberg, E. H. (Tel-Aviv U. Medical School, Israel) **A changing view of experience**. *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 117-124.—"A brief look at the implications of scalar usage, with Erikson as an example of this type of scale, suggests that normative concepts, concepts of good and bad, health and unhealth, are tautological, lack relevance to a criterion of mental health, and are unrealistic in accounting for change." A probabilistic and inter-actional network is discussed—a nondevelopmental construction free from deterministic mechanisms of causality.—*W. Vernon*.

9026. Sarason, Irwin G. & Smith, Ronald E. (U. Washington) **Personality**. *Annual Review of Psychology*, 1971, Vol. 22, 393-446. Reviews literature on personality with the view that "the science of personality revolves around the study of individual difference variables and behavioral predispositions which underlie trans-situational consistencies in behavior." In this light, the relevance of situational vs. dispositional variables to the study of behavior is considered. Attention is focused on work in (a) personality assessment (new scales, recent developments, construct validation approaches, birth order, and sex); (b) personality development (developmental trends, response to reinforcements, behavioral antecedents, and behavior acquisition); (c) personality and social behavior (altruistic behavior, interpersonal attraction, aggression, and cognitive dissonance); (d)

behavior therapy; and (e) interpersonal aspects of experiments. (317 ref.)—*P. Herzberg.*

PERSONALITY TRAITS & PROCESSES

9027. **Ancona, Leonardo & Pareyson, Rosetta.** (Catholic U. of the Sacred Heart, Milan, Italy) **Contributo allo studio della aggressione: La dinamica della obbedienza distruttiva.** [Contribution to the study of aggression: Dynamics of destructive obedience.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 70-99. The Italian replication and enlargement of S. Milgram's study on obedience and disobedience to authority, under conditions of actions against another person is related to Anna Freud's "identification with the aggressor," Fromm's "authoritarian conscience," and the Adorno, et al. "authoritarian personality."—*L. L'Abate.*

9028. **Bhushan, L. I.** (Bhagalpur U., India) **Personality factors and leadership preference.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 125-126.—Explored the relationships between certain personality factors and preference for authoritarian and democratic types of leadership. Ss were 400 male college students who came from middle- and lower-middle-class families. A 30-item Likert-type leadership preference scale (in Hindi), Hindi versions of California F Scale, A-S Reaction Study, Budner's scale of tolerance-intolerance of ambiguity, and the Eysenck Personality Inventory were used to measure the personality factors and leadership preferences. Results showed that preference for a democratic type of leadership is negatively related to authoritarianism, intolerance of ambiguity, and neuroticism, and is positively related to ascendance and extraversion. Organismic variables, i.e., age, education, and residential background, are not related to leadership preference.—*K. C. Panda.*

9029. **Block, Jack; Block, Jeanne; Siegelman, Ellen, & von der Lippe, Anna.** (U. California, Berkeley) **Optimal psychological adjustment: Response to Miller's and Bronfenbrenner's discussions.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 325-328.—Evaluates the interpretations and criticisms offered by D. Miller (see PA, Vol. 45:6296) and U. Bronfenbrenner (see PA, Vol. 45:4219) of an earlier article by E. Siegelman, J. Block, J. H. Block, and A. van der Lippe (see PA, Vol. 45:4232). Miller's view that clinical psychologists will not agree among themselves in defining optimal psychological functioning does not appear to be empirically supported. His interpretation of the findings in terms of social class and the bureaucratic-entrepreneurial distinction did not receive support when further analyses of the data were undertaken to test his views. While agreeing with Miller that psychologists should be aware of the social requisites of a culture and subculture in formulating their evaluations of character, it was further argued that the idea of cultural relativism unwittingly could operate to justify pathogenic, growth-limiting cultural arrangements. The Bronfenbrenner critique was judged not helpful.—*Journal abstract.*

9030. **Cattell, Raymond B.** (U. Illinois) **Estimating modulator indices and state liabilities.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 7-33.—Proposes an extension of the familiar factor analytic model which deals with traits to enable it to fit the psychological theory of modulation of behavior by ambient situations which change individuals' state levels and role involvements. More substance is given to this devel-

opment, defining more precisely the basic assumptions, the new concepts and setting out procedures for calculating new parameters. Most important among the latter are (a) the modulator values for each person in a situation, (b) the characteristic individual state level, and (c) the change in the group state level as a result of individual state changes. This model is also particularly development for integrating the traditional interest of psychometricists, centered on individual differences, with the tradition interests of experimentalists (researchers in learning and perception) centered on group changes in group means. It is suggested that this model brings to practical experimental work with concepts of mood, role, and the measurement of ambient-situational factors the precision characteristic of individual difference psychometry in a way not previously possible in this domain. (31 ref.)—*Journal abstract.*

9033. **Larsen, Knud S. & Schwendiman, Gun.** (Brigham Young U.) **Perceived aggression training as a predictor of two assessments of authoritarianism.** *Journal of Peace Research*, 1970, No. 1, 69-71. Investigated correlations between perceived aggression training practices, dogmatism, and chauvinistic nationalism. 157 male and 148 female 17-35 yr. old university students completed (a) a scale dealing with various forms of aggressive behavior as a child and the perceived reactions of the mother and father, (b) Levine's Internationalism-Nationalism Scale, and (c) Rokeach's Dogmatism Scale. Results indicate that perceived aggression training was significantly related to both dogmatism and chauvinism. No sex differences were found. Findings suggest that dogmatism and chauvinism are separate factors.—*S. Knapp.*

9034. **Lester, D. & Collett, L. J.** (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Fear of death and self-ideal discrepancy.** *Archives of the Foundation for Thanatology*, 1970, Vol. 2(3), 130.—Partial support was found for the hypothesis that those persons who perceive a large discrepancy between their real self and ideal self fear death more than those who perceive little discrepancy.—*Author abstract.*

9035. **MacDonald, A. P. & Hall, Janet.** (West Virginia U.) **Internal-external locus of control and perception of disability.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 338-343.—Collected ratings of the seriousness of various disabilities from 211 male and 200 female undergraduates. Ss rated the disabilities as they would affect "self" and "other" in their feelings about themselves and in their social relationships. As predicted, externally controlled Ss (as measured by the Rotter Internal-External Control Scale) rated physical disabilities as more debilitating than did the internally controlled. In contrast to externals, internals rated emotional disorders as being more debilitating relative to physical disabilities. Data are interpreted as adding to the construct validity of internal-external locus of control. Implications pertaining to reaction to disability are discussed.—*Journal abstract.*

9038. Sharma, Sagar. (Government Coll. of Education, Chandigarh, India) **Self concept and adjustment.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 71-76.—Reviews research studies on self-concept along 2 dimensions: (a) positive-negative self-concept, and (b) perceived self- and ideal-self-discrepancies. Studies conducted on normal Ss report a linear relationship between self-concept and adjustment. A curvilinear relationship is reported between the 2 variables when Ss were neurotics, psychotics, alcoholics, etc. Some methodological deficiencies of the existing measures of self-concept are discussed and further research directions are suggested. (36 ref.)—K. C. Panda.

Behavior Correlates

9039. Ancona, Leonardo & Croce, Maria A. (Catholic U. of the Sacred Heart, Milan, Italy) **Dinamica psichica e dinamismo cinematografico.** [Psychic dynamics and cinematographic dynamism.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 1-19.—Emotional consequences of movies are longer lasting and more impactful than previously assumed. Individuals with depressive tendencies tend to prefer movies with themes of intimacy and slow action. Extroverts prefer exciting, action-packed movies. War movies or sadistic themes are preferred by individuals who seem to deny these feelings in themselves. Themes of power, despotism, and oppression may be preferred by individuals with authority conflicts.—L. L'Abate.

9040. Bhushan, Rajnish. (H. D. Jain Coll., Arrah, India) **Intolerance of ambiguity in conformists and nonconformists.** *Manas*, 1970(May), Vol. 17(1), 35-39.—Using Bernberg's Human Relations Inventory for measuring social conformity and Budner's 7-point Likert-type scale for assessing intolerance of ambiguity it was found that conformist males were more intolerant of ambiguity than the nonconformist males.—C. Mehrotra.

9041. Donahue, Daniel & Sattler, Jerome M. (Ohio U.) **Personality variables affecting WAIS scores.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 441.—Assigned 32 undergraduate Es and 32 undergraduate Ss to 1 of 4 groups based on their scores on a hostility and a dominance scale. Each E interviewed 1 S for 10 min., rated the S on warmth and likability, and scored 4 WAIS verbal subtests completed by the S. Each S also rated the E for warmth and likability. Results indicate that (a) nonhostile Es gave more credit to hostile-dominant Ss and to nonhostile-nondominant Ss than to nonhostile-dominant Ss, (b) E's liking of S and rating of S's warmth were significantly related to total scores, and (c) S's ratings of E's warmth and likability were not positively related to S's test scores. It is concluded that E bias was present.—S. Knapp.

9042. Kumari, Kiran. **Sensory-motor learning in high and low anxious male and female undergraduates.** *Manas*, 1970(May), Vol. 17(1), 29-34.—On the basis of scores on the MA scale 20 male and 20 female undergraduates were divided into high and low

anxious groups. They were then asked to perform a sensorimotor task using a mirror star-tracing device. 3 measures were obtained for performance on this task: time taken in sec. on each trial, number of errors made, and the number of trials taken to reach the criterion of 1 errorless trial. Low anxious females took more time in performing the task than high anxious females; a reverse pattern was seen for high and low anxious males. Results obtained on the other 2 criterion measures were in the same direction.—C. Mehrotra.

9043. Lindauer, Martin S. & Reukauf, Lynn C. (State University Coll. New York, Brockport) **Introversion-extraversion and figure-ground perception.** *International Personality & Social Psychology*, 1971(Jan), Vol. 1(6), 107-113.—Investigated the relationship between figure-ground perception and introversion-extraversion in 3 groups of 5 male and 15 female undergraduates each, selected on the basis of their scores on the Introversion-Extraversion scale of the Eysenck Personality Inventory. Results for 6 ambiguous patterns, measured in terms of the initial percept, its latency and duration, and the number of reversals fail to confirm either W. McDougall's or H. Eysenck's theories relating the 2 phenomena. Only the reversal rate, which was lowest for introverts, and high for both extroverts and introverts, indicates any link between the perceptual and personality dimensions. The nature of figure ground, especially with respect to personality and of introversion-extraversion with reference to perception is discussed. Although data suggest some relationship between the 2 perceptual variables, certain cautions are considered. It is suggested that additional clarification appears necessary prior to further investigation of the existence of an effect and its determinants. (33 ref.)—Journal abstract.

9044. O'Connor, Constance A. (U. Southern California) **A study of personality needs involved in the selection of specific leisure interest groups.** *Dissertation Abstracts International*, 1971(May), Vol. 31(1), A5585.

9045. Ojha, H. (Bhagalpur U. India) **An experimental study of prestige suggestion in female extraverts and introverts.** *Manas*, 1970(May), Vol. 17(1), 1-5.—Tested whether extraverted females are more suggestible than introverted females. The MPI was administered to 200 female undergraduates. 2 distinct groups were then formed on the basis of MPI scores. In Session I of the prestige suggestion experiment all Ss ranked 12 slogans of national importance. In Session II the Ss ranked the same 12 slogans but this time they were paired with the names of leaders. The pairing was done in a reversed order for each S. In the pairing Session I was linked up with the leader whom S had given a rank of 12. The mean prestige suggestion score of introverts was significantly higher than that of extraverts.—C. Mehrotra.

9046. Paulson, Michael D. (U. North Dakota) **Differential behavior on skill and chance tasks as a function of perceived locus of control.** *Dissertation Abstracts International*, 1971(May), Vol. 31(1), A5586.

9047. Pederson, Andrew M. (U. North Dakota) **Effects of test anxiety and coaching groups on learning and performance.** *Perceptual & Motor Skills*, 1971(Jun), Vol. 33(2), 62.—Explored the relationship between a personality variable and behavior in coaching groups of male undergraduates differing in test anxiety (high, middle,

low) were equally divided at random into 2 groups and given either a paired-associate learning task or 2 performance tasks (vowel cancellation and multiplication problems) under 1 of 2 conditions. The Ss worked in coaching groups of 4 Ss each while the remainder worked on the tasks alone. With the learning task, no significant differences were found between Ss who learned in groups and those who learned alone regardless of anxiety level. With the performance tasks, the group situation was detrimental for both the high- and middle-anxious Ss while facilitative for the low-anxious Ss on the vowel cancellation task; however, no significant effects were found on the multiplication task. —*Journal abstract.*

9048. Selvey, Carmel L. (Columbia U.) **Concerns about death in relation to sex, dependency, guilt about hostility, and feelings of powerlessness.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5641.

9049. Sinha, R. M. (Gaya Coll., Magadh U., India) **Perceptual judgements of dependence prone persons in presence and absence of external cues.** *Mamta*, 1970(May), Vol. 1(1), 41-47. —Dependent proneness taken independently does not influence the perception of either time or length of a line. However, it is effective in interaction with a contextual factor in influencing the extent of error on the Müller-Lyer illusion. Male college students scoring high on dependent proneness overestimated the standard. Ss with low scores on this variable were more sensitive to the contextual factor whereas high scorers were more easily influenced by their personality disposition. —C. Mehrotra.

9050. Smith, Ronald F. & Flenning, Frank. (U. Washington) **Need for approval and susceptibility to unintended social influence.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 383-385. —Investigated the relationship between Ss' need for approval and their susceptibility to the subtle unintended influence of biased Eas. 48 female undergraduates divided into high- and low-need-for-approval groups (on the basis of their Marlowe-Crowne Social Desirability scale scores) were tested by 6 male Eas. It was suggested that prior failures to find such a relationship were due to the absence during the programmed pretask interaction of L and S of cues which would be likely to arouse Ss' approval motivation and thereby make him more susceptible to E's influence. A single sentence designed to arouse Ss' motivation was thus inserted into the standard pretask instructions. Under these conditions, Ss high in need for approval demonstrated a significant susceptibility to E's expectancy effects, while low-approval-motivation Ss did not. —*Journal abstract.*

9051. Sieln, Steven H. (Veterans Administration Hosp., Brooklyn, N.Y.) **Arousal level in repressors and sensitizers as a function of response context.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 386-394. —Gave 30 male and 30 female undergraduate repressors and sensitizers "noncontextual" and "contextual" tasks, with GSR as a measure of arousal. In the contextual situation, Ss were aware that they would be required to give free associations which might be self-revealing. In the noncontextual situation, Ss were not aware that they would eventually be required to form free associations. Results from the noncontextual task show that repressors had lower arousal levels than sensitizers during perception and verbal report, but higher during free association. Findings were reversed in

the contextual condition. Analogies were drawn to the behavior of repressors (hysterics) and sensitizers (obsessives) in psychoanalysis: repressors are more easily induced by the free association condition, whereas sensitizers are able to use free association to diminish emotional reactivity. —*Journal abstract.*

9052. Williams, J. G. (U. Bath, School of Education) **Personality factors and the acquisition of swimming skill.** *Papers in Psychology*, 1970(Apr), Vol. 4(1-2), 10-12. —Investigated personality and motor fitness differences between groups of 100 swimmers and 100 nonswimmers, 12 yr. of age. Swimmers scored significantly higher on measures of extroversion and slightly higher in stability (using the Junior Eysenck Personality Inventory). It is concluded that extroversion is an important variable associated with learning to swim and as such may rate as helpful information in the preparation of strategies for teaching the skill. —S. L. Warren.

9053. Williams, John L. (U. Waterloo, Ontario, Canada) **Personal space and its relation to extraversion-introversion.** *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 156-160. —Empirical, behavioral and questionnaire measures to test the hypothesis that extroverts would prefer to be physically closer to people with whom they were interacting than would introverts. Ss were 40 male extrovert and introvert undergraduates selected on the basis of either a high or low score on the Extraversion scale of the MMPI and a score close to the group mean on the Neuroticism scale. It was found that extroverts did not generally differ from introverts in their distance preferences but did consistently indicate that they could comfortably allow people to get closer to them than did introverts. (French summary). —*Journal abstract.*

INTELLIGENCE

9054. Bukvić, Aleksandar. **IQ granice za test Domino-48.** [IQ interval for Domino-48 Test.] *Psihologija*, 1969, 1970(Oct), Vol. 3(1), 127-128. —Administered the Domino-48 Test to a sample of 962 Yugoslavian college freshmen. The IQ norms thus established were, in all probability, more rigorous than the ones that would be arrived at for a more representative sample of this population. (Russian summary). —*English summary.*

9055. Dyer, Frederick N. (U.S. Army Medical Research Lab., Ft. Knox, Ky.) **A comparison of chromatic and achromatic versions of the Stroop Color-Word Test.** *Psychonomic Science*, 1971(Feb), Vol. 22(4), 235-237. —Administered the Stroop Color-Word Test to 25 chromatic versions of the Stroop Color-Word Test to 25 male 17-34 yr. old soldiers with visual acuity and color vision within normal limits. When the patches were rectangles, achromatic shades were named slightly faster than colors. With interference to naming from the use of incongruent names as stimuli, achromatic shades were named much faster than colors. Interference from incongruent names thus appears to amplify processing time differences and may prove useful for temporal analysis of the visual processing of hue, luminance, and saturation. Extensions of the Stroop test to other perceptual attributes should allow similar analyses of these attributes. —*Journal abstract.*

9057. Janković, Dženana. **Povezanost faktora introvertnost-ekstravertrnost i neurotičnost-emocionalna stabilnost sa uspehom ispitnika na subtestovima "Opšta informisanost" i "Shvatanje"** (Wechsler-Bellevue skala inteligencije, forma I). [Relationship between the factors of introversion-extraversion and neuroticism-emotional stability, and the Ss' performance on the Information and Comprehension subtests (Wechsler-Bellevue Intelligence Scale, Form I).] *Psihologija*, 1969-1970(Oct), Vol. 3(1), 95-102.—Using a sample of 118 female 1st- and 2nd-yr psychology students, 4 basic subsamples were formed based on results on the Eysenck Personality Inventory: (a) neurotic extroverts, (b) neurotic introverts, (c) emotionally stable extroverts, and (d) emotionally stable introverts. Ss responded individually to items which were contained in the Information and Comprehension subtests; prior to this, the groups had been equalized in respect to the mean IQ obtained by the Domino Test. By comparing the average performance of these subsamples on the subtests, the conclusion was that simultaneous effect of both of Eysenck's personality dimensions could influence the performance on an intelligence test. Qualitative analysis of responses, as well as the Ss' behavior in the test situation, also revealed differences between the different subsamples. Results substantiate the notion of the necessity of a systematic examination of the "nonintellectual" factors which enable their influence to be controlled when administering the general intelligence tests. (Russian summary)—*English summary*.

9058. Jensen, Arthur R. (U. California, Inst. of Human Learning, Berkeley) **The role of verbal mediation in mental development.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 39-70.—Various types of verbal and symbolic mediational processes which facilitate learning and comprise largely what is meant by "intelligence" are viewed in terms of both maturation and learning. Current research gaps and some directions for future research in this field are indicated. The practical importance of research on verbal mediation is that it suggests some of the processes by which instructional techniques might inculcate and train cognitive skills that facilitate learning and problem solving. (49 ref.)—*Author abstract*.

9059. Roche, Dermot. (New Ulster U., Coleraine, Ireland) **On the concurrent validity of the Goodenough-Harris Draw-A-Person Test.** *Papers in Psychology*, 1970(Apr), Vol. 4(1/2), 5-7.—The Goodenough-Harris Draw-A-Person Test and the Bender-Gestalt were administered to 113 7-9 yr. old 3rd graders (60 girls, 53 boys). Statistical analysis using Spearman's rank-order correlation techniques indicated a concurrent validity coefficient of .40 ($p < .001$). This result is of the order found in other concurrent validity studies of the test and found to indicate that the Goodenough-Harris shows reasonable concurrent and discriminant validity. The reasonable concurrent and discriminant validity. The latter concept asserts that a valid test should not only measure what it is supposed to measure, but also that it should not measure anything else. (17 ref.)—S. L. Warren.

9060. Thumin, Fred J. (U. Missouri, St. Louis) **The Mental Dexterity Test: A study of reliability and validity.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 163-166.—Ascertains the reliability and concurrent validity of a new omnibus mental ability test which has considerably more ceiling than most group intel-

ligence tests, and which is proposed for use either as a speed or power device, once the appropriate norms are established. When administered to 184 college students under untimed conditions, the Mental Dexterity Test was found to have a split-half reliability coefficient of .84 and a Kuder-Richardson 20 reliability coefficient of .85. Regarding validity, the test correlated significantly with grades assigned in the classes which participated in the study (.26) and also with cumulative GPA based on all courses taken at the university (.40).—*Journal abstract*.

9061. Thyssen, Sven. **Om muligheden for at konstruere diagnostiske intelligensprøver.** [Diagnostic tests of intelligence.] *Skolepsykologi*, 1970, Vol. 7(5), 350-358.—Presents a psychological outline as a basis for construction of diagnostic intelligence tests. Key concepts are motives, goals, and methods, with intellectual functions defined as arrays of ways to reach a goal. Intellectual aspects of behavior then must be described by exploring the personal world and ascertaining substantive relations.—*English summary*.

9062. Wessler, Richard L. (Parsons Coll.) **Estimating IQ: Expertise or examiner effect?** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 268.—Studied examiner (E) estimates of IQ by having 16 graduate students estimate the IQs they thought they would obtain from their Ss. Each examiner gave at least 5 WAIS or WISC tests and no more than 10 others for a total of 15 tests as part of an individual testing course. Data were analyzed separately for the 12 Es who gave the WAIS and the 4 who gave the WISC. Es tended to overestimate IQs and length of acquaintance with Ss was negatively correlated with accuracy of estimate. The need for a more extensive investigation of E differences in the administration and scoring of psychometric instruments is indicated.—P. Hertzberg.

9063. Williams, Robert L. (Washington 1) **Abuses and misuses in testing black children.** *Counseling Psychologist*, 1971, Vol. 2(3), 62-73.—Concerned with whether lower scores obtained by blacks are attributable to heredity or biased intelligence tests, the validity of ability tests as accurate measures of black intelligence is questioned. Tests have resulted in labeling black children falsely, leading to "dehumanization and Black intellectual genocide." The meaning of intelligence is found too diverse and poorly understood, and the definition of intelligence rests on problem solution and response to various questions. Tests can shape teaching in schools, for occasionally the test itself is taught. Accordingly, in order to improve the educational system, 1 strategy is to alter the tests' content, and to employ items relevant to the black experience. Black educational models for black children should be the task of black professionals. Although some individuals, e.g., Bennett, argue for the intellectual inferiority of blacks, the courts overrule their allegations. (22 ref.)—W. S. Sahakian.

CREATIVITY

9064. Bhan, Rajnath. (Kurukshetra U., India) **Social factors in creative potentiality.** *Manas*, 1970(May), Vol. 17(1), 21-27. High- and low-creative potential groups were formed by administering the Rorschach test to 66 graduate students. These 2 extreme groups were then interviewed to obtain data on social variables. None of the social factors were found to be significantly related to creative potential.—C. Mehrotra.

9065. Bloomberg, Morton. (Western Connecticut State Coll.) **Creativity as related to field independ-**

ence and mobility. *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 3-12.—Mobility (shift in developmental level) was assessed to clarify previous results on the relationship between field independence and creativity. Ss were 60 paid volunteer male undergraduates. A slim majority of creative Ss were field dependent. No significant effect of field independence or mobility or interaction effect was found for creativity, but mobility had a significant effect in an analysis of verbal intelligence. These findings were used as a basis for reexamining the roles of vertical and horizontal mobility. (30 ref.)—*Author abstract*

9066 Calvi, Gabriele. (Catholic U. of the Sacred Heart, Milan, Italy) **La natura e i limiti della creatività nevrotica.** [Nature and limits of neurotic creativity.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 685-702.—Kubie's theory of neurotic distortions on the creative process was applied to the case of an Italian painter A. Rotondi, who became progressively disorganized in his work. (25 ref.)—*L. I. Abate*

9067 Calvi, Gabriele. (Catholic U. of the Sacred Heart, Milan, Italy) **L'ideazione di un test (TAU) per la misura del potenziale mentale.** [Rationale for a test (TAU) for the measurement of mental potential.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 703-721.—Presents a self-administered test of creative potential assessing logical-formal and imaginative components. (14 ref.)—*L. I. Abate*

9068 Csikszentmihalyi, M. & Getzel, J. W. (U. Chicago) **Discovery-oriented behavior and the originality of creative products: A study with artists.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 47-52.—Examined the significance of the "problem-formulation" stage of creative activity. 31 advanced art students were observed in a quasi-naturalistic setting of an art school while carrying out an assignment to produce a still-life drawing. Observations of "discovery-oriented" behavior were recorded for each S from the organization of the objects until drawing completion. The finished art work was independently evaluated by an expert panel on 3 dimensions: (a) overall value, (b) originality, and (c) craftsmanship. A positive relationship was found between discovery-oriented behavior at the problem-formulation stage and the originality, but not the craftsmanship, of the creative product. Results affirm the theoretical and empirical importance of the problem-formulation stage of the creative process and suggest a method for observing and analyzing behavior at this stage. (22 ref.)—*Journal abstract*

9069 Hlavsa, Jaroslav. (Research Inst. for Administration & Automatization, Prague, Czechoslovakia) **Psychologické prostředky pro rozvoj kreativity.** [Psychological methods of creativity development.] *Psychologie v Ekonomické Praxi*, 1969, No. 2, 57-66.—Describes methods which stimulate various kinds of creativity and which represent purposeful cultivation of creative activity. The description is presented as instruction, and is psychologically explained and placed within the context of other psychological knowledge. Among the cultivation methods described are (a) management and economic games, (b) day dreaming, (c) new attitude creation, (d) drugs, and (e) hypnosis. Facilitation methods considered are (a) heuristic methods, (b) self-questioning, (c) problem analysis, and (d) "brainstorming." Applications of the various methods to fields of human work are discussed. (Russian & German summaries)—*English summary*

9070 Hlavsa, Jaroslav. (Research Inst. for Administration & Automatization, Prague, Czechoslovakia) **Určování a měření tvůrčích schopností.** [Identification and measurement of creative abilities.] *Psychologie v Ekonomické Praxi*, 1969, No. 3, 124-132.—Considers creativity as indispensable for success in many areas of human activity, e.g., technology, science, art, diplomacy, politics, industry, science, education, and management. Experimental and diagnostic methods to facilitate study of the creative structure process and the degree of development of creative abilities are reviewed. General directions for the selection of suitable means for creativity evaluations are presented. (Russian & German summaries) (15 ref.)—*English summary*

9071 Khatena, Joe. (Marshall U.) **Repeated presentation of stimuli and production of original responses.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 9-14.—An analysis of the responses of 50 junior and senior men and women in undergraduate educational psychology classes using alternate forms. Onomatopoeia and Images as tests of originality and of 27 graduate students in a seminar on creative behavior using Form I of Sounds and Images and Form II of Onomatopoeia and Images shows increasing originality with each repetition of the stimuli. The break away from perceptual set for the production of original responses seems to be effective in both instances and the results support the present mode of presentation of Onomatopoeia and Images and Sounds and Images. Results also support the idea that original thought requires considerable effort. (10 ref.)—*Journal abstract*

9072 Kvasčev, Radivoj. **Konformistička i nonkonformistička ličnost i stvaralaštvo.** [Relationship between the conformist and nonconformist personality and Creativity.] *Psichologija*, 1969-1970(Oct), Vol. 3(4), 45-61.—Presents theoretical considerations on conformity and nonconformity, their social implications, and the psychological mechanisms through which they are manifested. An analysis of the different methods of conformity measurement as a characteristic of the personality is also included. A wider research project is described which deals with different factors of creative thinking and with the possibilities of training in the field of creative thinking. Some preliminary results are reported. (Russian summary)—*English summary*

PERSONALITY MEASUREMENT

9073 Bernhardtson, Clemens S. & Fisher, Ronald J. (U. Saskatchewan, Saskatoon, Canada) **The relationship between personal desirability and endorsement with a forced-choice technique.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 63-73.—Reliability differences were found between the personal desirability ratings given by individual Ss to the 2 statements comprising the EPPS items. Ss were 82 undergraduates. Also the statement which the S had rated as the more desirable member of the pair tended to be endorsed. Measures of personal desirability based on all the items on each EPPS scale were found for each EPPS scale for each S. I consisted of the sum of difference scores obtained by subtracting the rating of the nonkeyed statement from the rating of the keyed statement. The other consisted of the number of items with the keyed statement rated more desirable than the nonkeyed statement. Both of these measures were positively related

to scores obtained on the scales. (16 ref.)—*Journal abstract.*

9074. Dayries, John L. & Grimm, Ronald L. (U. Montana) **Personality traits of women athletes as measured by the Edwards Personality Preference Schedule. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 229-230.**—Administered the EPPS to 21 women intercollegiate athletes and compared scores with those of a normative group of 749 college women. Results indicate that the women athletes were significantly different on 2 of the 15 variables measured by the EPPS, i.e., they scored significantly lower ($p = .05$) on order than the normative group and significantly higher ($p = .05$) on intracception.—*Journal abstract.*

9075. Eisenman, Russell & Huber, Herman. (Temple U.) **Creativity, insolence, and attractiveness of female experimenters. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 515-520.**—In a study with 73 male and 70 female undergraduates, correlations were run between scores for (a) insolence and creativity, and (b) insolence and adventurousness. 2 different conditions were employed: an attractive female served as E, or E was a female chosen for her unattractiveness. The Insolence Scale and the Personal Opinion Survey were combined into 1 86-item test called the Personnel Test Battery and administered to the Ss. Significant correlations were obtained for both a and b among female Ss, but males showed a significant correlation between creativity and insolence only in the condition in which E was an attractive female. Females were significantly less insolent than males. Results have implications for creativity research and for the issue of artifacts in experimental research. (19 ref.)—*Journal abstract.*

9076. Howarth, Edgar & Browne, James A. (U. Alberta, Edmonton, Canada) **Investigation of personality factors in a Canadian context: I. Marker structure in personality questionnaire items. *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 161-173.**—Constructed a 100-item personality questionnaire by adapting 67 marker items from S. B. Sells, R. G. Demaree, and D. P. Will and 10 from Eysenck in order to see whether restructured items would reappear as factors in item factor analysis. The questionnaire was administered to 329 undergraduates and the data factor analyzed by principal axis and rotated by varimax. The following factors were identified: emotional stability, sociability, conscience, shyness, relaxed composure, impulsiveness, individual tolerance, considerateness, group tolerance, physical prowess, energy, trust vs. suspicion, group affiliation, rathymia, and paranoid sensitivity. The attempted replication was reasonably clear-cut, showing 44 out of 77 markers in an appropriate position and suitably marked by salients greater than .30. The implication is that certain widely used personality questionnaires, not based on item analysis of the most stringent kind but on prior item groupings, should be carefully reevaluated. Comparisons are drawn between the factors obtained in independent item-factoring and it is concluded that the method holds considerable promise for the replicable measurement of personality structure. (French summary) (15 ref.)—*Journal abstract.*

9077. Mikesell, Richard H. & Calhoun, Lawrence G. (U. Georgia) **Response set on the Zung Self-Rating Depression Scale. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 22.**—Assessed the effect of the order of items on total scores on the Zung Self-Rating Depression Scale (SDS), using 60 female high school

seniors, randomly assigned to 1 of 2 groups. Group I was administered the standard form of the SDS and Group II a form in which the 20 items were arranged in random order. No significant order effects were found. Since total scores did not appear to be influenced by the standard clustering of items according to symptom categories, the SDS appeared to be useful and reliable.—P. Hertzberg.

9078. Stanton, H. E. (Flinders U., School of Social Sciences, Bedford Park, South Australia) **The Taylor scale: A measure of chronic anxiety or of emotional reactivity? *Australian Journal of Psychology*, 1971(Apr), Vol. 23(1), 69-72.**—Administered the MA scale to 132 male and 108 female undergraduates and assigned them to high, moderate, and low anxiety groups on the basis of their scores. Members of each group were then randomly tested under stress or nonstress experimental conditions. Under both conditions Ss learned the order in which 14 colored geometric forms were presented to them. 5 trials were given. Results support the hypothesis that the MA scale is a measure of emotional reactivity, and not a measure of chronic anxiety as is often supposed.—*Journal abstract.*

Inventories

Projective Techniques

9079. Beck, Michael & Bart, Leonard. (St. John's U., Jamaica, N.Y.) **Inter-rater and test-retest reliability of a proportionality measure for the D-A-P. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 89-90.**—Describes satisfactory test-retest (.81) and interjudge (.91) reliabilities obtained on a measure of proportionality for male figure drawings. The Draw-A-Person Test was administered to 20 male and female undergraduates. Results suggest that, over a 2-mo period, the proportional accuracy of male human figure drawings for the above sample is quite stable and that 2 judges working independently can reliably score male figure drawings.—*Journal abstract.*

9080. Cull, John G. & Hardy, Richard F. (Virginia Commonwealth U.) **Concurrent validation information on the Machover Draw-A-Person Test. *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 211-215.**—Attempted to determine if it was possible to identify specific personality characteristics as indicated by a recognized personality inventory through the use of the Draw-A-Person Test. Ss were 69 male and 33 female school teachers. Results indicate that definite personality characteristics are identifiable through the use of the Machover Draw-A-Person Test. Results also indicate that certain priorities, procedures, and methods of response do significantly affect interpretive results. Since in all questions posed by the researchers were answered in the affirmative, it appears that this research substantially supports the contention that the Machover Draw-A-Person Test is an instrument of high concurrent validity.—*Author abstract.*

9081. Faidherbe, D., Choisel, G., & Bléder, J. **Le test de la main. [The Hand Test] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 582-589.**—Faced with the proliferation of projective tests there is a special value attached to those which are simple and easily administered that can be rapidly scored and interpreted. The Hand Test meets these requirements. Like the

Canada) **Psychological aspects of a sex chromatin abnormality.** *Canadian Psychologist*, 1971(Apr), Vol. 12(2), 270-281.—Compared 147 male special security patients with no demonstrated chromosome abnormality, and no evidence of brain damage or psychosis, with 2 groups of genetically abnormal male patients ($n = 32$) evincing an XXY or XYY chromosome pattern. All groups received a full-scale WAIS and an Eysenck Personality Inventory. XXY Ss were significantly lower in verbal and performance ability than Ss in the other 2 groups. They were also more defensive in answering a personality questionnaire, partly a function of their lower intelligence. Both genetically abnormal groups contained a higher proportion of Ss with significantly depressed verbal abilities than the control group, though the trend was similar for all 3 groups. Approximately 1% of both genetically abnormal groups had committed some form of sex crime. It is suggested that this might indicate a specific genetic-based lag in mental aspects of sexual maturation in addition to the already demonstrated general social instability. 9098. Pethő, B. (U. Budapest, Neuropsychiatric Clinic, Hungary) **Von der Anwendung der Testmethoden in der Psychiatrie, mit besonderer Rücksicht auf den Aufbau der Diagnose und auf die Ausbildung der Holopsychiatrie.** [The application of test methods in psychiatry, with particular consideration of diagnosis and the development of holopsychiatry.] *Psychiatria Clinica*, 1971, Vol. 4(2), 100-123. Discusses the confusion in present-day psychiatry and test psychology, and proposes that the introduction of test methods into psychiatry offers the opportunity for clarification through an organically-oriented approach. This means that the basis must be at the level of sensorimotor signs, functions, and performances which can be ascertained by neurological methods. One must exploit those aspects of tests which offer a broader spectrum than the normal psychiatric examination. It is suggested that this approach be called the "holopsychiatric approach." The holopsychiatric approach must be nosocentric and anthropocentric at the same time (i.e., it must be oriented towards a comprehension of the illness at the somatic, as well as the psychic, cultural, and individual levels). (39 ref.)—*English summary*.

9099. Redlich, F. C. (Ed.) (Yale U., Medical School) **Social psychiatry: Proceedings of the Association for Research in Nervous and Mental Disease, December 1 and 2, 1967, New York, N.Y.** Baltimore, Md.: Williams & Wilkins, 1969. xiii, 354 p. \$21.

9100. Remschmidt, H. (Philipps U., Psychiatric Clinic for Children & Youth, Marburg/Lahn, W. Germany) **Redundanz und Regression: Informationstheoretische Gesichtspunkte zum Verständnis psychopathologischer Phänomene.** [Redundancy and regression: Aspects of an information theory concerning the understanding of psychopathological phenomena.] *Psychiatria Clinica*, 1971, Vol. 4(2), 65-81.—Presents a model of development based on the information theory. The model of development is based on 3 parallel steps: (a) dismantling of fixed redundant behavior patterns, (b) dismantling of less fixed behavior patterns, and (c) secondary reduction

in the degree of choice of behavior. This information-theoretical model of development is seen to permit the accommodation of various levels of organization of behavior, mathematical presentation, and classification of psychopathological phenomena as redundant behavior patterns. Illustrative examples are provided. (39 ref.)—*English summary*.

9101. Rotter, Julian B. (U. Connecticut, Clinical Psychology Training Program) **Clinical psychology.** (2nd ed.) Englewood Cliffs, N.J.: Prentice-Hall, 1971. x, 117 p. \$6.50(cloth), \$2.75(paper).

9102. Sarró, Ramón. **Psiquiatria oriental-occidental.** [Eastern-Western psychiatry.] *Revista de Psiquiatria, Psicología Médica*, 1970(Apr), Vol. 9(6), 367-382.—After discussing some of the philosophers and theosophists of the 19th century who have concerned themselves with the wisdom of the East, the views of Fromm, Jung, and J. H. Schultz are considered. Fromm's analogies between psychoanalysis and Zen Buddhism are considered to be inappropriate, the author siding more with Jung and Schultz. The views of psychosis held by both Freud and Jung are considered deficient because in their private practice these psychiatrists lost their contact with the world of the schizophrenic. The classic view of psychiatry of psychotic delusions is not shared: (a) the delusions do not reflect distorted judgment, the patient's judgments are adequate to the new reality that he is facing; (b) the contents of the delusions are not just extensions of his normal life experiences, they are exceptions; and (c) while the primary delusion is pathological in nature, it is not automatic but a process of creative activity. The biographical emphasis on the interpretation of delusions in classical psychiatry is underplayed in favor of an analysis of mythological themes in delusions. These deal with universal topics, such as the End of the World and the World Savior, but are unlike the archetypes since they do not represent racial memories but are actual beliefs.—*L. Zisne*.

9103. Selderman, Arthur S. (Fairleigh Dickinson U.) **Motor planning and developmental apraxia.** *Journal of the American Optometric Association*, 1970(Oct), Vol. 41(10), 846-857.—Presents a discussion of developmental apraxia, which is characterized by a deficiency in the ability to motor plan. A review of this type of perceptual-motor dysfunction is presented along with its associated syndrome. The basic principle of treatment is the enhancement of tactile and kinesthetic discrimination through control of sensory input followed by the demands of a purposeful skilled motor task. Several case studies are included to illustrate the theoretical discussion. (27 ref.)—*Journal abstract*.

9104. Sinha, T. C. **On repression.** *Samiksha*, 1969, Vol. 23(2), 60-64.—Unlike Freud, Bose traces the mechanism of repression in the field of opposite wishes of the patient. For every wish there is an opposite wish—I being of the active type and the other of the passive type. For the theory of the opposite wish Bose posits a new concept of theoretical ego which is different from the ego postulated by Freud. This hypothetical entity maintains the continuity of mental experience during all time. A wish is a product of experience gained by the ego, and it has no existence of its own other than in a relationship with or as a function of the ego.—*C. Mehrotra*.

9105. Spurlock, Jeanne, et al. (Meharry Medical Coll.) **The private practice of child psychiatry by members of the American Academy of Child Psy-**

chiatry. *Journal of the American Academy of Child Psychiatry*, 1971(Jan), Vol. 10(1), 53-64.—The 1966 Workshop on Private Practice evoked an interest in attaining specific facts on private practice of child psychiatry. The Committee devised a questionnaire sent to 263 members which dealt with direct child patient practice, and salaried positions. Direct child patient practice was divided into 2 categories: (a) direct patient care, and (b) consultation. Regarding salaried positions, 4 areas were investigated: (a) administration, (b) teaching and supervision, (c) direct patient care, and (d) research. Findings indicate that a substantial part of most private practice time is used for treating adult patients. This time increases with the increasing age of the therapist. In addition, findings regarding referrals, time of session, consultation, and teaching are discussed as well as an awareness of several new types of practices of child psychiatry.—H. Reiter.

Germany) **Aktuelle Probleme der psychoanalytischen Ausbildung in den USA.** [Actual problems of psychoanalytic training in the USA.] *Psyche, Stuttgart*, 1970(Aug), Vol. 24(8), 611-637.—Reviews the development of the institutionalization of psychoanalytic training including theoretical seminars, didactic training analysis, and control analysis. Commonalities and differences are noted regarding the corresponding conditions in the United States, England, and West Germany. It is suggested that analysts in all 3 countries, concentrate on the psychoanalytic didactic relationship and frequently overlook group dynamic processes and organizational problems which are of utmost importance for the efficacy of training programs. *Journal summary.*

9112. Burnand, G. (High Wycombe Coll. of Technology & Art, England) **A study of the concept of change at work for senior hospital staff, via the semantic differential technique.** *Social Science & Medicine*, 1970(Apr), Vol. 3(4), 627-637. Studied the emotional interrelationships between different sorts of change encountered at work among 16 30-55 yr old senior hospital staff members, by means of a modified semantic differential technique. It was hypothesized that there are 2 emotional structures underlying the attitude to change. 2 factors were extracted which could be consistently labeled the "adventure" and "insecurity" factors. The adventure factor was characterized by the freedom to (a) meet different people, (b) change the method of working, (c) use a variety of equipment, and (d) look at things at different distances. The concept most reliably linked to this factor was "holiday," and included both high evaluation and activity. The "insecurity" factor was most frequently characterized by change in instructions given, method or level of pay, and, less reliably, change of management. This factor was reliably "tense" and particularly unrelated to the more relaxed leisure pursuits of TV and dancing. It is concluded that the most disturbing aspects of change may vary with the work situation, the position in the hierarchy, and with personality and past experience (16 ref.).—*Journal abstract.*

9117 Harrison, Saul L., McDermott, John F., Schragar, Jules, & Showerman, Earl R. (U. Michigan) **Children's Psychiatric Hosp.: Social status and child psychiatric practice. The influence of the clinician's socioeconomic origin.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 652-658. Investigated the influences of class background on the diagnoses, clinical perceptions, prognosis, and recommendations for treatment of 2 groups of child psychiatrists: those who were born into the upper middle class and those whose childhood was spent in the lower class or lower middle class. 360 psychiatric evaluations were performed by the former, and 228 by the latter. The differences found point up the need for clinical training to draw the psychiatrist's attention to understanding the role his social background may play in his interaction with his patients. *Journal abstracts*

9118 Heising, G. & Beckmann, D. (U. Giessen) **Psychosomatische Clinic W. (Germany) Gegenübertragungsreaktionen bei Diagnose- und Indikationsstellung.** [Countertransference reactions in diagnosis and indications disposition.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1971(Jan), Vol. 21(1), 2-8. Investigated countertransference reactions and indication criteria for several psychotherapeutic and group-analysis procedures in the outpatient ward of a psychosomatic clinic in Giessen, West Germany. Various countertransference stereotypes could be demonstrated with the therapists; these were statistically correlated with personality characteristics and the analytical level of training of the therapists. They influenced the indication as well as the actual selection of the patient for psychotherapeutic procedure. It is suggested that a control of these subjective factors can be the 1st step toward withdrawal of individual stereotyped biases. Institutionally dependent attitudes which arise against entire patient groups (e.g., insured or private patients) are discussed. *English summary*

An exercise in education and community organization.** *Minnesota Mental Health Journal*, 1971(Mar), Vol. 16(1), 25-31. Outlines the background, need for, and implementation of a training program for a group of county welfare workers representing 10 counties in southwestern Minnesota. The program, which evolved from a community effort by 2 community mental health centers, is described in terms of its philosophy, content, and results. Implications for extended training of welfare and other social service personnel are denied. *Journal abstracts*

9123 Rothman, Leslie K. (Indiana U.) **Toward a theoretical conceptualization of the Whitehorn-Betz A-B scale.** *Journal of Consulting & Clinical Psychology*, 1971(Jan), Vol. 39(1), 442. Administered the Whitehorn-Betz A-B scale, the Sundland and Barker Therapy Orientation Questionnaire, and a biographical information scale to 30 male doctoral level counselors. Results of analyses indicate that (a) the therapists' orientation was independent of his A-B disposition and (b) A therapists were socially dependent conforming, while B therapists were socially independent nonconforming. It is suggested that the results support a complementary hypothesis in which "the counselor able to handle the interpersonal and intrapersonal skills the client needs."—S. Knapp

9124 Shapiro, Theodore & Frosch, William A. (New York U. Medical School) **Faculty response to student confrontation.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 599-605. A psychiatric faculty was confronted with the need for change by 130 discontented 1st-yr medical students. A description of the events and some of the factors involved in the faculty response to the student demands is presented. There were a number of irrational and emotional factors influencing faculty attitudes; these variously reinforced prior tendencies in favor of or against change. Recognition of these irrational tendencies is essential if polarization is to be prevented and cooperation and problem solving are to be promoted. *Journal abstracts*

9125 Sherr, Rose L. (U. Kansas) **Dogmatism as a factor in preprofessionals' evaluations of persons with physical disabilities.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6164.

9126 Smail, D. J. **Values in clinical psychology.** *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 313-315. A rapid process of change is seen as taking place in clinical psychology in Britain. This change threatens radically to alter the kinds of situation in which future clinicians will find themselves working, and which is resulting in a shift in the fundamental scientific philosophy which has until recently supported the discipline. The failure to recognize the difference between objectivism in measurement and objectivism in manipulation is central to the change which threatens to affect the clinical psychologist's role.—V. S. Sexton

9127. Zenz, H. (Justus Liebig U., Psychosomatic Clinic, Giessen, W. Germany) **Gruppenprozesse in einer Stationspersonalkonferenz.** [Group processes in a hospital ward personnel conference.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Nov), Vol. 20(6), 236-246.—Reports results of an interaction process analysis of a hospital conference for ward attendants. The purpose of the conference was to foster independence, on the part of attendants, dealing with neurotic patients. Responses were computed during the 6-hr conference using a slightly modified Bales interaction process analysis. Matrices of transition probabilities from physicians to ward personnel were computed, and a flow chart of the group process was formulated. Results demonstrate the constancy of voting (decision) behavior on the part of physicians and oscillating behavior on the part of ward attendant personnel. (English summary)—B. A. Stanton.

9128. ———. **Toward therapeutic care: A guide for those who work with the mentally ill.** *GAP Report*, 1970(Mar), Vol. 7(77), 126 p.

9129. Banerji, Saradindu. **Psychoanalytic therapy, theory and morality.** *Samiksa*, 1969, Vol. 23(2), 73-80.—Instead of inducing the S to immorality, psychoanalysis helps him to renounce his impulses by bringing them to consciousness. Self-knowledge is the goal of spiritual life. This goal cannot be achieved if looking into the instinctive aspect of the self is considered immoral. Although analysis is against repression it does not allow unlimited gratification. Unlike a normative science, psychoanalysis is concerned with the facts as they are and not what they ought to be. The psychoanalyst does not take the role of a moral mentor. Psychoanalysis can serve the cause of morality in many ways.—C. Mehrotra.

9130. Baranger, Madeleine. (3044 Ramón Castilla, Buenos Aires, Argentina) **Introducción al grupo B: Teoría e institución psicoanalítica: La formación psicoanalítica.** [Introduction to Group B: Psychoanalytic institution and theory: Psychoanalytic training.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 211-219.—Discusses the values and goals of psychoanalysis as an institution, noting a dissociation between formal rules and statutes and those which are adhered to in reality. This lack of sincerity is attributed to 3 reasons: (a) the influence of the social image of psychoanalysis and the social status of the psychoanalyst; (b) the structure and functioning of the institution not only with regard to its organization as a whole, but its distinct parts, its hierarchical structure, and promotion system; and (c) the difficulties inherent in the analytic process. In the last case, it is suggested that the analyst should be particularly alert during countertransference reactions to remain an instrument of interpretation and avoid introjecting his own feelings and judgments. Commentaries by N. Scornik and F. Elman de Schutt follow.—P. Hertzberg.

9131. Baranger, Willy. (3044 Ramón Castilla, Buenos Aires, Argentina) **Introducción al grupo D: Teoría psicoanalítica e ideología: Interacción mutua.** [Introduction to Group D: Psychoanalytic theory and ideology: Mutual interaction.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 227-234.—Considers (a) the ambiguity in regarding psychoanalysis as a science or

ideology; (b) to what extent psychoanalysis originated and developed according to its own laws; (c) to what point it reflects the sociocultural conditions of its environment; and (d) the multiplicity of psychoanalytic theories and their "fan-like" development. Warnings against the dangers of success are discussed, i.e., psychoanalysis becoming an "establishment" institution. Commentaries by J. R. Paz and J. P. Schust follow.—P. Hertzberg.

9132. Bergen, Bernard J. & Rosenberg, Stanley D. (Dartmouth U., Medical School) **The new neo-Freudians: Psychoanalytic dimensions of social change.** *Psychiatry*, Washington, D.C., 1971(Feb), Vol. 34(1), 19-37.—Discusses contemporary criticisms of society as meaningless, and delineates an emergent theory of culture more in tune with radical perspectives. The theory is based on the works of H. Marcuse, P. Rieff, and N. O. Brown—the new neo-Freudians who interpret contemporary crises as a bankruptcy of society's collective symbols. It is asserted that "play" which is erotic, dionysian, and narcissistic—is the counterpoint of culture which protects the ego boundaries through social controls. And while play can make man lonely and vulnerable, it can also give him the freedom to love himself and others more fully.—E. M. Upchurch.

9133. Bowers, Margaretta K., et al. (Adelphi U.) **Therapy of multiple personality.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Apr), Vol. 19(2), 57-65.—In multiple personality, conflicting portions of the original personality have become 2 or more, largely disparate and autonomous personalities. Being a portion, each may be called a subpersonality. Of each 2 subpersonalities, at least 1 has some amnesia for the other. The therapist must be especially competent, particularly if he uses any hypnosis, deep analysis, or strong suggestion. He must avoid whatever may separate the subpersonalities further, and help the subpersonalities to unite in common understanding, interests, memories, and living as a complete person. ECS is contraindicated. Useful methods may include group therapy, especially when the other members, as witnesses, can help each subpersonality to remember each other subpersonality's behavior, feelings, and thoughts and to merge to become whole. (Spanish & German summaries)—*Journal abstract*.

9134. Breggin, Peter R. (Washington School of Psychiatry, D.C.) **Psychotherapy as applied ethics.** *Psychiatry*, Washington, D.C., 1971(1cb), Vol. 34(1), 59-74.—Analyzes Freudian psychotherapy as an ethical system with a basic rule that "the patient ought to say everything that occurs to him, and the therapist ought not to take advantage of this candor." It is stated that the distinction between thoughts (such as I want to kill my father) and actions are a "basic ethical distinction." The ethical bases of theories of Alexander, Erikson, and Szasz are examined. The basic goal of psychotherapy is seen as autonomy which "refers to the internal life of the individual—to his capacity to think for himself and to remain the absolute ethical and moral judge of his own thoughts and conduct." Also discussed are 3 basic ethical issues in therapy: love, suicide, and termination.—E. M. Upchurch.

9135. Collomb, H. & de Preneuf, Chantal. **N'doep et psychodrame.** [N'doep and psychodrama.] *Bulletin de Psychologie*, 1969 1970, Vol. 23(13-16), 745-749. Presents an analysis, based on analogy, of the relationship between psychodrama and the African therapeutic

- technique of n'doep practiced by the Lebou and Wolof peoples of Senegal.—R. J. Smith.

[A serious case of dyspareunia and vaginismus.] *Acta Psiquiátrica y Psicológica de América Latina*, 1971(Feb), Vol. 17(1), 19-32.—A 35-yr-old woman, suffering from severe dyspareunia and vaginismus which prevented her from having normal sexual intercourse with her husband over a 5-yr period, was treated within the framework of Rogers' client-centered psychotherapy. The treatment lasted 7 months in biweekly sessions and a further 3-wk period with 1 session/wk only. The patient became aware of the fact that her sexual problem was closely related to the conflicts she had with her mother. Later in therapy the patient overcame a phobia to water. Further evidence which attests to the success of the treatment is the fact that the patient conceived and after a difficult delivery had a normal baby.—*English summary*.
9148. May, Philip R. (U. California, Neuropsychiatric Inst., Los Angeles) For better or for worse? Psychotherapy and variance change: A critical review of the literature. *Journal of Nervous & Mental Disease*, 1971(Mar), Vol. 152(3), 184-192.—It has been suggested that psychotherapy makes some persons better and some worse, and that this might explain why investigators have failed to demonstrate overall improvement by comparison with a control group. Other studies have inferred that this variance in psychotherapy outcome is related to therapist levels of empathy, warmth, and genuineness. A critical survey of the evidence, the experimental studies cited in support are reviewed separately. The review indicates that, with the exception of 1 study of which the findings were equivocal, the conclusion that psychotherapy may induce a mixture of improvement and deterioration rests upon a flimsy and poorly controlled or weakly documented base. Although it is important to realize that psychotherapy, like any other treatment, may have adverse effects, there is no convincing evidence.

that, in situations where psychotherapy is on the average ineffective, there is greater outcome variation than in a control group. (46 ref.)—*Journal abstract.*

9149. Mintz, Ronald S. (U. California, Center for the Health Sciences, Los Angeles) **Basic considerations in the psychotherapy of the depressed suicidal patient.** *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 56-73.—Discusses a number of frequently occurring motivations for suicide. Detection and assessment of suicide danger is discussed, as are a number of important precautionary steps which the therapist should take. A short overview of various procedures to be undertaken during therapy is presented, including suggestions for pharmacotherapy. (52 ref.)—*W. Vernon.*

9150. Mom, Jorge. (1938 Juncal, Buenos Aires, Argentina) **Introducción al grupo E: Teoría psicoanalítica y forma de vida.** [Introduction to Group E: Psychoanalytic theory and life style.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 238-248.—Discusses the discrepancies between theory and reality in psychoanalysis, noting problems on both the institutional and personal levels. Modern psychoanalysis is criticized for distorting the original theories and perpetuating a system of contradictions. Comments by B. López and E. Pavlovsky follow.—*P. Hertzberg.*

9151. Morgenthaler, Fritz. (41 Utoquai, Zurich, Switzerland) **Introducción a la mesa redonda sobre trastornos de la identidad masculina y femenina tal como se observan en la práctica psicoanalítica.** [Introduction to the round table on masculine and feminine identity disturbances that are observed in psychoanalytic practice.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 249-260.—Discusses the psychodynamics of sexual identity disturbances in homosexuals, stressing the importance of transference reactions as indicators of previous sexual identity states from which future developments may be evaluated. Homosexuality is considered to be a developmental problem in which the patients experience all types of sexual differentiation in a regressive manner: superiority vs. inferiority, strength vs. weakness, and omnipotence vs. helplessness. The therapist's role in guiding the homosexual to his correct sexual identity without damaging his self-esteem is elaborated. A commentary by M. Langer follows. (45 ref.)—*P. Hertzberg.*

9152. Rolla, Edgardo H. (2698 Avenida del Libertador, Capital Federal, Argentina) **La interpretación en el psicoanálisis de psicóticos.** [Interpretation in the psychoanalysis of psychotics.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 261-270.—Proposes that psychoanalysis of psychotics should include both verbal and nonverbal interpretations, the former being complemented by kinetic models which lead to denotative and connotative bases for communications. The importance of nonverbal gestures and actions in psychotics is stressed, noting that patients with ideational disturbances have minimal contact with reality and perceive themselves within a schema of object relations. Treatment experience with an 18-yr-old male is cited. (English & French summaries) (19 ref.)—*P. Hertzberg.*

9153. Rosenthal, Alan J. & Levine, Saul V. (Stanford U., Medical School, Palo Alto, Calif.) **Brief psychotherapy with children: A preliminary report.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 646-651.—Presents some of the results of a pilot study to test the efficacy of brief psychotherapy with 33 children with various disorders and to compare its usefulness with

traditional, long-term psychotherapy with a control group of 35 children. More than 1/2 the experimental group were successfully treated and maintained their improvement over the 1-yr follow-up period. Criteria for the selection of Ss and techniques for treatment that may improve the rate of success achieved with brief psychotherapy are discussed. (21 ref.)—*Journal abstract.*

9154. Samorajczyk, John. (Prince George's County Health Dept., Bureau of Mental Health, Hyattsville, Md.) **The psychotherapist as a meaningful parental figure with alienated adolescents.** *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 110-116.—Discusses therapeutic management of alienated youth in a hospital setting. A combination of therapeutic models was used in a "responsibility training" effort. Lack of individual identification was suggested as a basic problem, and the therapist functioned as a parent figure who increased the patient's autonomy. *W. Vernon.*

9155. Schütze, G. (U. Tübingen, Div. of Adolescent Psychiatry & Neurology, W. Germany) **Therapeutische Erfahrungen bei Pubertätsmagersuchtigen.** [Therapeutic experiences with anorexia nervosa in puberty.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1971(Jan), Vol. 21(1), 14-20.—Presents initial results of treatment of 9 female, adolescent patients with anorexia nervosa utilizing in- and outpatient psychotherapy. The mean age of patients was 12.9 yr. Inpatient treatment duration was an average of 51 days, while outpatient treatment duration averaged from 1-14 mo. Positive results were achieved with both forms of treatment. 8 patients evidenced a complete recovery, and 1 patient suffered a relapse. Family constellation patterns of these patients are discussed in relation to progression of treatment and relapse rate. (English summary)—*B. A. Stanton.*

9156. Stone, Alan A. (Harvard Medical School, Boston, Mass.) **Suicide precipitated by psychotherapy: A clinical contribution.** *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 18-26.—Many therapists unwittingly contribute to the probability of serious suicide attempts in suicide-prone patients. Case material illustrates 3 patterns: (a) A few therapists succeed in "externalizing the superego" by mirroring the patient's self-revilings, leading to hopelessness, agitation, and suicide. (b) Some therapists "interrupt autistic defenses." Without their previous wish-fulfilling fantasies the patient confronts an unbearable and depressing reality. (c) The therapist develops a "symbiotic transference" of an extremely primitive nature, which is then broken off. This is the most frequent pattern. Awareness of these patterns of "malignant intervention" is urged.—*W. Vernon.*

9157. Torda, Clara. (101 W 12 St., New York, N.Y.) **An effective therapeutic method for the LSD user.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 79-88.—Reports observations obtained during the 1st 6 mo of a psychoanalytically oriented psychotherapeutic procedure, capable of shortening and easing the initial phase of psychotherapy of LSD users. Observations were of 50 16-29 yr. old Ss from a wide variety of ethnic, cultural, religious, and financial backgrounds. The procedure consisted of combined individual and group therapy, adding the LSD users to open mixed groups of abstinent patients. This procedure enabled the LSD users to participate in psychoanalysis, using the classical procedure, within less than 6 mo. Specific character trends and the underlying psychodynamic processes are

also suggested. These processes appear to be specific for the LSD user and differ from those of the heroin addict and the chronic alcoholic (23 ref.)—*Journal abstract*

9158 van Ameringen, Suzanne F. (Boston, Psychoanalytic Inst. Mass.) **The psychoanalysis of a young adolescent girl.** *Journal of the American Academy of Child Psychiatry*, 1971(Jan), Vol. 10(1), 23-32. A case study following the patient's analysis gives rise to the study of: (a) the psychological issues salient for successful intellectual perfection and achievement and (b) the vicissitudes of her psychosexual development during her adolescent years. The case attempts to show: (a) how the rise of an unfavorable self-image can occur in a girl whose history did not reveal major disturbances and whose parents provided her with an above average favorable milieu; (b) the girl's ability to obtain masochistic and narcissistic gratification from her underachievement from adhering to a prepubertal stance; and (c) how a traumatic experience in her preschool years became a source of guilt and a blockage to "knowing" and "growing up."—*Journal abstract*

9159 van Kiliac, J. (U. Louvain, Brussels, Belgium) **Une thérapie des rôles figés. L'apport de G. Kelly.** [A therapy of set roles. The contribution of G. Kelly.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 793-798. Presents a distillation of the work of George Kelly who is not well known in French-speaking countries, covering core constructs, role constructs, and the exercise of playing the role of a totally different person for long periods of time. It is emphasized that the task of therapy is creation not repair (22 ref.)—*R. E. Smith*

9160 Well, Pierre G. (U. Belo Horizonte, Brazil) **Psychodrame et psychoanalyse.** [Psychodrama and psychoanalysis.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 726-735. Presents a detailed description of similarities and differences, origins, language, and viewpoints of psychodrama and psychoanalysis. The possible integrations, modifications, and the challenge for the future in perfecting these psychotherapeutic methods are discussed (26 ref.)—*R. E. Smith*

9161 Zac, Joel. (1476 Anchorena, Buenos Aires, Argentina) **Consideraciones sobre el acting out y aspectos técnicos de su tratamiento.** [Considerations on acting out and technical aspects of its treatment.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 307-364. Discusses the analyst's role and acting-out situations, noting that a precarious balance exists between the neurotic and psychotic parts of a patient's personality in which the latter is kept in balance by inoculatory acting out on the analyst or the setting. The analytic week is regarded as playing a central role in determining characteristics of the weekend, which, in turn, influences the analytic week. The interacting relationship between week and weekend has special significance for the Monday session which serves to reestablish the projective identification which the patient manifests with regard to the analyst. Case material and different types of acting out to disturb the analytic setting are described. Interpretation and some countertransference problems are discussed. The distortion of the setting in certain cases and the possible abuse by the analyst of the transference relationship is discussed. (English & French summaries) (25 ref.)—*P. Hertzberg*

Therapeutic Process

9162. Barrucand, Dominique. **Catharsis et psy-**

chodrame. [Catharsis and psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 736-738.—Presents a critical assessment of the concept of catharsis from Aristotle and Freud through Breuer, Freud, and Moreno. The process of catharsis in psychodrama is followed both theoretically and descriptively.—*R. E. Smith*

9163. Berzans, Juris L., Barnes, Daniel F., Cohen, Daniel I., A. Ross, Wesley F. (Kentucky) **Reappraisal of the A-B therapist "type" distinction in terms of the Personality Research Form.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 360-369. A revised personality dimensions involved in the personality type distinction which has proved controversial in patient compatibility in several clinical and research studies. The A-B scale scores of 221 patients and 100 normals were related to the 22 variables of the Personality Research Form. Multiple discriminant analysis and factor analyses strongly support the hypothesis that A-B status is explicable in personality terms. So-called A-type Ss (predicted to be compatible with neurotic patients) were characterized by emotional regression, social ineptness, and a restricted socialization. B-type Ss (presumably compatible with neurotic patients) appeared socially ascendant and "open" to life experiences. Results were supported by a cross-validation study of 50 professional Ss. As a prior research, the variables differentiating A-B status appeared to have a prominent "masculinity-femininity" component (30 ref.)—*Journal abstract*

9164. Cesari, Fidias R. (2829 Santa Fe, Buenos Aires, Argentina) **Introducción al grupo A: Teoría y técnica psicoanalítica. Contratransferencia: Interpretación transferencial y contratransferencial.** [Introduction to Group A. Psychoanalytic theory and technique. Countertransference. Transference and countertransference interpretation.] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 201-210. Discusses the development of countertransference in the analytic setting within the context of the transference process. Definitions of countertransference by H. Racker and Freud are presented. The countertransference experience of Freud with his 6-yr-old patient Dora is described. It is noted that contradictions arise between practice and theory in regard to countertransference. 2 commentaries on countertransference by C. Sluzki and J. C. Marotta are included.—*P. Hertzberg*

9165. Gale, Jay. (U. Tennessee) **The effects of expectation and suggestion upon symptom substitution.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5621

9166. Irwin, Tom J. (U. Missouri) **An investigation of the expression of empathy of A and B therapists in a quasi-therapeutic encounter.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5128-5129

9167. Lavenaire, Michel & Picard, Françoise. (U. Nancy, Medical School, France) **Transfert en psychothérapie de groupe et psychodrame.** [Transference in group psychotherapy and psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 715-725.—Presents a resume of transference from Freud to Lacan and of definitions by Laplanche and Pontalis out of which arise the similar points of view of group psychotherapy and the psychoanalysis. Moreno's views of transference, the "dilution" of transference, group cohesiveness, and the actions of the therapist are discussed. (44 ref.)—*R. E. Smith*

9168. Mendes Leal, Rita. (Lisbonne U., Portugal) **Revécu, réexpérience, "tele" et transfert.** [Reliving, reexperiencing, "tele" and transference.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 927-930.—Considers the question of transference, both Freudian and Morenoian, in terms of the constructs underlying each system. The various uses of the concept arise out of the need to understand what memory is in the dynamics of psychological functioning. The concepts of "tele" and transference do not reduce to a common factor but each serves to describe processes which propose, by different ways, to attain totalization of psychic operations, i.e., equilibrium of the personality in relation to the self and others.—R. E. Smith.

9169. Prager, Richard A. (Columbia U.) **The relationship of certain client characteristics to therapist-offered conditions and therapeutic outcome.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5634-5635.

9170. Voutsinas, Dimitri. **A propos de la catharsis.** [About catharsis.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 998-999.—Presents a historical and philosophical review of catharsis. Through catharsis in its many forms man is raised to a higher moral religious sphere, feels joyous, and is reconciled with the virtuous ethic.—R. E. Smith.

Group Therapy

9171. Ancelin-Schutzenberger, Anne. (U. Nice, France) **Introduction au(x) psychodrame(s).** [An introduction to psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 713-714.—Serves as an introduction to and an evaluation of articles on psychodrama. The collection intends to show, by the bits chosen for publication, just where psychodrama stands currently as a focal point for a wide variety of viewpoints and activities.—R. E. Smith.

9172. Ancelin-Schutzenberger, Anne. **Présentation du psychodrame.** [Presentation of psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 969-993.—The purpose of devoting an entire issue to the subject of psychodrama is to present it "in such a way as to make the philosophy and techniques comprehensible to the reader and avoid the numerous misunderstandings and impassioned reactions that the technique sometimes unleashes because of lack of understanding." (9 p. ref.)—R. E. Smith.

9173. Ardooin, Jacques. **Reflexions sur le psychodrame en tant qu'expérience cruciale.** [Reflections on psychodrama as a crucial experience.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 740-744.—Psychodrama is the science "that seeks truth" through dramatic methods, a crucial place of privileged encounter of the real and the imaginary at the intersection of time and space. It is a method of exploration of the whatever underlies the functional illegality of the pleasure principle as opposed by the reality principle. As part of this picture, psychodrama is a means of exploring the truth.—R. E. Smith.

9174. Basquin, Michel; Dubuisson, Paulette; Lajeunesse, Bertrand, & Testemale-Monod, Genevieve. **Réflexions sur le couple thérapeutique en psychodrame.** [Reflections on the therapeutic couple in psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 775-778.—Presents the methods whereby

pairs of psychotherapists utilize spontaneous dramatization with individuals and in limited groups. R. E. Smith.

9175. Battegay, R. (U. Basel. Psychiatric Polyclinic, Switzerland) **Klinische Gruppenpsychotherapie in ihrer analytischen und verhaltenstherapeutischen Potenz.** [The potential analytical and behavioral therapy of clinical group psychotherapy.] *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 281-294. Reports personal experiences based on 15 yr. experience with the use of group psychotherapy at the Basel University Psychiatric Hospital. Group psychotherapy was conducted with both large and small diagnostically-integrated groups. 5 stages in group psychotherapy (explorative contact, regression, catharsis, insight, and change) are described in relation to their accomplishment in a collective situation. The group-centered psychiatric hospital is advocated as a means of enabling patients to experience the demands of society without exposure to the restlessness of the "outside world." The group process itself encourages insight, personality development, assumption of social roles, and adaptation through corrective learning. (English summary) (25 ref.)—B. A. Stanton.

9176. Blatner, Howard. **Commentaires sur quelques réserves ordinairement faites concernant le psychodrame: Aspects théoriques du psychodrame, données générales: La place du psychodrame dans l'arsenal psychothérapeutique: L'utilisation du contact corporel comme complément au psychodrame: Quelques indications et réserves.** [Comments upon some reservations concerning the achievements of psychodrama: Theoretical aspects of psychodrama, general data: The place of psychodrama in the psychotherapeutic arsenal: Utilization of bodily contact to complement psychodrama: Some indications and cautions.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 957-968. Discusses uses and abuses of "immediate intimacy" or the "fusion tendency." An evaluation of body contact spontaneously arising in psychodrama is presented.—R. E. Smith.

9177. Bonabesse, Maurice. (Hôpital Psychiatrique de St. Alban, Lozère, France) **L'utilisation du psychodrame dans le traitement des alcooliques.** [The utilization of psychodrama in the treatment of [The utilization of psychodrama in the treatment of] alcoholics.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 834-838. Many forms of psychotherapy are not suitable for the treatment of alcoholics. Group therapies, particularly psychodrama, are most successful because isolation and verbiage are reduced, transference is not manipulatable, and reality is present in the here and now. R. E. Smith.

9178. Chatel, Marie M. **Les groupes de rencontre.** [Encounter groups.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 994-997. Encounter groups, as opposed to training groups, are sociotherapeutic. Despite the separateness of individuals and the refusal of any group identity a group culture is identifiable. Training groups became encounter groups in response to the conjoint importance of psychology and social change in the United States. R. E. Smith.

9179. Cuvellier, Ferdinand & Mattheeuws, Annie. **Le psychodrame de l'alcoolique.** [Psychodrama for the alcoholic.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 829-833. Discusses psychodrama when used as a tool in the multidisciplinary treatment of alcoholics. Selection of patients, psychodrama treatment process,

and dynamics of patients treated are described.—R. E. Smith

9180 Fontaine, Pierre J. L. *Le psychodrame chez les adolescents handicapés en institution* [Psychodrama with institutionalized adolescents] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 923-926. Psychodrama was used with wholly and partially institutionalized adolescents all of whom were verbally handicapped on a mental and physical basis. The mentally handicapped group showed greater spontaneity, freer conception, and easier group interaction, etc. The motor problem group revealed intense affect around parental rejection. Handled individually a child could be given meaning of his situation and expression of affect via a psychodramatist double that he had not previously been able to achieve by himself.—R. E. Smith

9181 Gounod, Solange. *Le jeu de rôle ou l'irruption des possibles* [Role playing and the possibilities of irruption.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 158-159. Discusses role playing in sensitivity groups and human relations training. Examples of individual distressing experiences arising out of role playing are cited. It is suggested that the use of role playing is a promising means of investigating the personalities involved in group therapy if the therapist is certain of his capacity to deal with possible unanticipated emotional outbursts.—R. E. Smith

9182 Kestenberg, J. & Deubert, S. *Approche psychanalytique pour la compréhension de la dynamique des groupes thérapeutiques* [Psychoanalytic approach to the understanding of the dynamics of therapeutic groups] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 802-815. Presents an account of the establishment of drama psychoanalysis groups utilizing part verbalization and part dramatization and with male and female analysts as therapists the technique is effective with certain psychotic patients. Case demonstrations are included. (25 ref.)—R. E. Smith

9183 Lebovici, S., Diatkine, R., & Kestenberg, E. *Bilan de dix ans de pratique psychodramatique chez l'enfant et l'adolescent*. [A ledger of ten years practice of psychodrama with children and adolescents.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 839-888. Psychodrama as a means of expression with supporting clinical excerpts is viewed as understandable in all of its aspects if the therapist makes use of theories of psychoanalytic technique. Transference, resolution of transference neurosis, transference interaction, resistance, countertransference, and regression are all discussed as they relate to psychodrama. General techniques of psychodrama, indications for its use, and the results and conclusions of 10 yr experience with the techniques are included. (34 ref.)—R. E. Smith

9184 Lema, Michel. *Réflexions sur le psychodrame triadique avec enfants et adolescents dans le cadre d'un centre médico-psycho-pédagogique*. [Reflections on triadic psychodrama with children and adolescents in a medico-psycho-pedagogical treatment center.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 784-792. Presents informative observations from 5 yr experience in a treatment center setting with the objective not of establishing a hierarchy of different treatments but of refining and seeking to make more precise the indications and perhaps some contraindications of each.—R. E. Smith

9185 Lemoine, Gennie. *L'imaginaire, le*

symbolique et le réel confrontés à l'expérience psychodramatique. [The imagined, the symbolic, and the real confronted in the psychodrama experience.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 827-831. Discusses the necessary limits, dynamic use of imaginary, symbolic, and real facets in the psychodrama experience.—R. E. Smith

9186 Lemming, Paul. *L'oedipe et ses repères en psychodrame*. [Oedipus and its referents in psychodrama] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 884-887. Discusses psychodrama as here-and-now enactment of familial role, treated as projection of the past. Dynamic, diagnostic, and case material included and handled from the psychoanalytic frame of reference.—R. E. Smith

9187 Mathé, André. *Psychothérapie de groupe de délinquant*. [Group psychotherapy with delinquents.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 827-831. Briefly describes methods used in the administration of group therapy to an undefined population of 25-35 yr old prison inmates in France. Attendance at group therapy was voluntary. Voluntary Ss were seen to be attracted to participation in group psychotherapy through curiosity and a need to participate in voluntary activity. The duration of therapy ranged from 6 mo to 1 yr. Results were evaluated on the basis of subjective criteria and overt behavior. The value of the use of group psychotherapy in penal institutions is stressed as seen to promote resocialization and reduced feelings of alienation.—B. A. Stanton

9188 Menchenbaum, Donald H., Gilmore, J., Barnard, & Fedoravskis, A. L. (U. Waterloo, Ontario, Canada). *Group insight versus group desensitization in treating speech anxiety*. *Journal of Consulting & Clinical Psychology*, 1971 (Jun), Vol. 36(3), 410-42.

Compared 3 forms of group treatment for their relative therapeutic effectiveness in reducing speech anxiety: (a) desensitization, (b) insight, and (c) combined desensitization and insight. 53 18-26 yr. old volunteers were assigned to 9 groups including a discussion group (attention placebo) and a waiting list control group. Ss filled out several self-report measures (The Confidence of Speaking, Social Avoidance and Distress, and Fear of Negative Evaluation scales) and a speech anxiety questionnaire. Results indicate that the insight group was as effective as the desensitization group in significantly reducing speech anxiety over control group levels as assessed by behavioral, cognitive, and self-report measures given immediately after posttreatment and at a 3-mo follow-up. The desensitization group treatment appeared to be significantly more effective than insight treatment with Ss for whom speech anxiety was confined to formal speech situations, conversely, insight group treatment appeared to be significantly more effective with Ss who suffer anxiety in many varied social situations. (42 ref.)—*Journal abstract*.

9189 Mendes Leal, Rita. *Le transfert analytique dans l'analyse de groupe*. [Analytic transference in group analysis] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 760-764. Discusses the analytic conceptual structure of transference and the differences occasioned by mirror feedback, multiple levels, free association, etc. in groups.—R. E. Smith

9190 Mintz, Elizabeth E. (41 5th Ave., New York, N.Y.) *Therapy techniques and encounter techniques: Comparison and rationale*. *American Journal*

of *Psychotherapy*, 1971(Jan), Vol. 25(1), 104-109.—Encounter techniques are seen as having valuable symbolic meanings which can be lost upon group leaders who have little awareness of their psychodynamics. It is suggested that encounter techniques would be most useful when combined with conventional group or individual therapy.—*W. Vernon.*

9191. Moreno, Zerka T. "Psychodrame de nourrissons" dans une consultation infantile. ["Psychodrama of infants" in a baby consultation.] *Bulletin de Psychologie*, 1969 1970, Vol. 23(13-16), 826-828. —Describes a psychodrama session in which 10 mothers of 4-6 wk. old babies, with the infants on their laps, participated in therapeutic counseling with the auxiliary ego in the role of "baby."—*R. E. Smith.*

9193. Nodiot, Simone. Quelques réflexions à propos du psychodrame. [Some thoughts concerning psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 771 774. —Presents reflections drawn from classical Morenian psychodrama. The inclination of psychodramatists to undergo psychoanalysis is characterized as a fad but it is conceded that they may find the theory that permits them to understand and control the real requisite is considered to be voluntary seeking and participating in the group activities and directions of the therapist's efforts.—*R. E. Smith.*

9194. Ossorio, Abel G. & Fine, Leon. Le psychodrame dans un hôpital psychiatrique. [Psychodrama in a psychiatric hospital.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13 16), 934-939.—Reports on the psychodrama in day-long sessions for 73 long-term female patients. Psychodrama is seen as perhaps the most promising of all group techniques for reestablishing communication in those patients who have regressed to a level in which interaction is minimal.—*R. E. Smith.*

9195. Pagès, Max. Les langages du sentiment. [The languages of the feelings.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 779-783.—Attempted to clarify levels of communication: the language of action, symbol, rational exploration, emotion, and sentiment or immediacy on the basis of distance from immediate experiences. Periods of transition of levels show as uneasiness in the group, and dialogue can occur without a break in continuity only on relevant levels by a response from another with an action evoked because that other person recognizes the evoking action and its significance to the one who evokes it. Dialogue is favored when an authentic personal response can be made. Further, dialogue is broken if a therapist insists on a response to a situation in the particular language of his own school of thought.—*R. E. Smith.*

9196. Rocheblave-Spenlé, Anne M. Rôle et psychodrame. [Role and psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 816-819.—Discusses and describes the concept of role and its relationship to psychodrama.—*R. E. Smith.*

9197. Rojas-Bermudez, Jaime G. L'objet intermédiaire: Contribution à l'utilisation de marionnettes en psychodrame. [The intermediate object: The contribution of the use of marionettes in psychodrama.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(13-16), 940-943.—Recognizable, identifiable, real, concrete

objects—in this case puppets—may function as intermediaries in permitting communication between therapist and patient during psychodrama sessions. An intermediary permits preservation of necessary distance, and diminishes anxiety arising from human intrusion or assumption of roles.—*R. E. Smith.*

9198. Royer de García Reinoso, Gilbarte. (2320 Charcas, Buenos Aires, Argentina) Violencia y agresión o bien violencia y represión? [Violence and aggression or, better, violence and repression?] *Revista de Psicoanálisis*, 1970(Apr), Vol. 27(2), 271 305. Discusses the theoretical and technical aspects of violence and aggression. Theoretically, adaptation, reality, and the qualitative aspects (i.e., concepts of sickness and health which form the bases of psychoanalytic theory) are discussed. On the technical level, material from group therapy sessions is analyzed. The metaphor is regarded as a symbolic form in which psychological reality covers concrete reality; other models of aggression are described. The question of isolation or reintegration of the violent individual into society is considered. *P. Hertzberg.*

9199. Schindler, W. (5G, Portman Mansions, London, England) Betrachtungen zur Technik der analytischen Gruppenpsychotherapie. [Observations concerning techniques of analytic group psychotherapy.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1971(Jan), Vol. 21(1), 27 35. Enumerates the various schools and techniques of analytical group psychotherapy. Group psychotherapy based on the family pattern is described. Patients perform multilateral transferences from the original family to the group members (e.g., the father leader, the sibling members, and the whole group as a "mother") Bion's basic assumptions of dependency, flight and fight, and sexual pairing are discussed. Techniques suggested by H. Iznel, D. Whiteaker, Lieberman, and R. Battegay are reviewed. (15 ref.)—*English summary.*

9200. Tarrah, Gilbert. (1, Montreal, Quebec, Canada) Happenings et psychodrames. [Happenings and psychodramas.] *Bulletin de Psychologie*, 1969 1970, Vol. 23(13 16), 915 922. Formulates the hypothesis that common elements may exist in psychodramas and happenings. Differentiations and similarities linking drama, new language, sight-sound-scene and aim and end point of psychodramas and happenings are considered.—*R. E. Smith.*

9201. Yablonsky, Lewis & Ennels, James M. (St Elizabeth's Hosp., Washington, D.C.) Théorie et pratique de psychodrame. [Theory and practice of psychodrama.] *Bulletin de Psychologie*, 1969 1970 Vol. 23(13 16), 765 770. The 5 essentials of psychodrama are the group, the protagonist, the director or psychodramatist, the auxiliary egos, and the system of methods and techniques. Described and illustrated are the functions, purposes, and therapeutic objectives.—*R. E. Smith.*

Behavior & Conditioning Therapy

9202. Berner, P., Grünberger, J., & Sluga, W. (U. Vienna, Psychiatric & Neurological Clinic, Austria) Der Videorecorder als therapeutischer Behelf: Eine verhaltenstherapeutische Technik bei Strafgefangenen. [The videocorder as a therapeutic aid: A behavior therapy technique for criminals.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1971(Jan), Vol. 21(1), 21-27. Describes a new device, the videocorder,

to be used as a therapeutic tool which enables behavior data to be stored and fed back as new information. Acoustic replay of group psychotherapeutic discussions for criminals is seen to expedite the reinforcement of positive social interactions. From a behavior therapy standpoint, the video recorder is seen as an instrument for behavior modification through coding and conditioning of control and defense mechanisms. Methods of employing the video recorder in group therapy are discussed. (English summary) —B. A. Smeaton.

9203 Costello, C. G. (U. Calgary, Alberta, Canada). **Conditioned avoidance responses and phobias: A reply to Wolpe and to Powell and Lumia.** *Psychological Review*, 1971(Jul), Vol. 78(3), 348-351. Replies to articles by J. Wolpe and by A. Powell and A. Lumia (see PA Vol. 46 June 58). It is maintained that these critics have not concerned themselves directly with the argument that conditioned avoidance responses do not provide a plausible experimental paradigm of phobias. Instead, they argue in favor of classically conditioned emotional responses and punitive behavior and learned helplessness as paradigms of phobia acquisition and maintenance. These arguments are not considered to add in further validation of the original proposal. (34 ref.) —Journal abstract.

9204 Fennell, H. J. (U. London, Inst. of Psychiatry, England). **Behavior therapy as a scientific discipline.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 39(3), 314-319. Discusses arguments purporting to show that behavior therapy is an inherently limited, partial approach to mental disorder in human beings. It is argued that (a) the oversimplified, partial nature of present theories is the inevitable price for attempting to approach this field scientifically rather than in a literary, humanistic fashion; (b) this approach cannot be judged by philosophical a priori arguments, but only in terms of its own aims and successes or failures; and (c) available data gives tentative support to the general direction of thought and approach of the behavior therapist. Obvious limitations to scientific theories are outlined. It is concluded that whatever the weaknesses of the approach under consideration, it presents the only hope for a proper understanding of mental dysfunction and effective treatment. (22 ref.) —Journal abstract.

9205 Fix, Alan J. (State U. New York, Buffalo). **The use of the relationship between skin conductance and subjective fear in predicting outcome in systematic desensitization and an expectancy-based therapy.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5619-5620.

9206 Hersen, Michael. (Fairfield Hills Hosp., Newtown, Conn.) **Resistance to direction in behavior therapy: Some comments.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 121-127. —The existence of resistance to direction in behavior therapy is established as a potent factor influencing the outcome of the treatment irrespective of the mode of behavior modification being used. Strategies for dealing with instances of resistance to direction displayed in the various paradigms of behavior therapy are reviewed. Examining the clinical data from a traditional psychotherapeutic framework, possible motivating factors for manifestation of resistance in the behavioral context are considered. The implications of the survey are outlined. (19 ref.) —Author abstract.

9207 Kraft, T. (Claybury Hosp., Woodford Bridge, England). **Systematic desensitization using emo-**

tional imagery only. *Perceptual & Motor Skills*, 1971(Jun), Vol. 30(1), 293-294. —Describes a 19-year-old female patient successfully treated by systematic desensitization in which all imagery was on an emotional plane and who was unable to produce any visual imagery. It is argued that the importance of the focus in the desensitization procedure is on the emotional and subsequent elimination of emotional imagery and other forms of imagery, though desensitization may possibly not be essential to occur. —Journal abstract.

9208 Kravner, Leonard. (State U. New York, Stony Brook). **Behavior therapy.** *Annual Review of Psychology*, 1971, Vol. 22, 483-532. Presents an overview of behavior therapy in its historic context and through presentation of diverse elements of research and conceptualization, relating this field from other approaches. Behavior therapy is conceptualized as the application of behavior principles derived from the experimental laboratory to modifying deviant human behavior, as the use of the usage of specific techniques, usually based on learning principles, within the context of a real-life situation. A review of the literature indicates that the present status of the field is comparable to that of most other fields of psychology. A philosophy of publications, many inadequate research designs, and self-controlled sophisticated studies are criticized. Application to relevant human problems is discussed as to its efficacy in changing behavior, need for caution, and the need for ethical concerns as to its social and value implications. (37 ref.) —Journal summary.

9209 Litvak, Stuart B. (Arizona State U.). **The contribution of non-specific variables to outcome of systematic desensitization therapy.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5629.

9210 Matos, Robert L. (U. Kansas, Bureau of Interval Research). **Some relevant dimensions of interval recording.** *Academic Therapy*, 1971(Spr), Vol. 6(3), 235-244. Briefly discusses dimensions of interval recording procedures for contingency management in the natural environment. Anecdotal recording of S behavior under varying conditions is seen as often facilitating the selection of appropriate behavioral units for formal observation. Nature, rate, number and complexity and interest in temporal patterns of behavior influence the selection of continuous and interval recording. Guidelines for observation period duration, sampling behavior, selecting the number of behavioral categories, and determining interval duration are suggested. The relationship of stability criteria to base-line variability, and the reliability of behavioral measures are discussed. Examples of simple interval and coded multiple interval categories are presented. —C. J. Walther.

9211 Nordquist, Vey M. (U. Tennessee). **Physiological, cognitive and motor assessments of systematic desensitization.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5632.

9212 Portes, Alejandro. (U. Illinois). **Behavior therapy and critical speculation.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 320-324. —Considers critical analysis, when departing from concrete problems and generating testable propositions, as a legitimate aspect of scientific development. Examination of the limitations of behavioristic theory in its passage to therapeutic practice and the nonexploited supplementary mechanisms inherent in the latter gen-

erates several such propositions. 4 of these are presented. Arguments justifying circular definitions of reinforcement and extrapolating from social reinforcement studies in animals to human processes are critically examined. (77 ref.)—*Journal abstract.*

9213. **Portes, Alejandro.** (U. Illinois) **On the emergence of behavior therapy in modern society.** *Journal of Consulting & Clinical Psychology*, 1970(Jun), Vol. 36(3), 303-313.—Considers the emergence of behavior therapy in our times as both an indicator and a consequence of major cultural trends. Behaviorism, when applied to complex human disorders, is an inherently limited, partial approach. Thus, use of behaviorism by behavior therapists in such cases is mainly analogical. The growth of behavior therapy is not explainable by its intrinsic merits alone; hence, an explanation must be found in its broader cultural setting. Rationalism as the dominant trend in modern culture has rendered that culture particularly receptive to the behavioristic image of man. The sociology of knowledge perspective is employed here to discuss the relative status of behavior therapy, reactions against it, and the unacknowledged transformations of behaviorism in its passage from theory to practice. (36 ref.)—*Journal abstract.*

9214. **Powell, Arnold & Lumia, Augustus R.** (Columbus Coll.) **Avoidance conditioning and behavior therapies: A reply to Costello.** *Psychological Review*, 1971(Jul), Vol. 78(4), 344-347.—Critiques the conclusion of C. G. Costello (see PA, Vol. 44:12732) that avoidance responses are adaptive and phobias unadaptive. It is argued that behaviors cannot be functionally distinguished on the basis of adaptiveness, since adaptiveness refers to a relationship between a given response and particular environmental events. Given Costello's definition of adaptiveness, it can be shown that avoidance behaviors are unadaptive under a variety of conditions. The analysis of avoidance conditioning by R. Herrnstein (see PA, Vol. 43:6644) does not eliminate fear reduction as a sufficient condition for avoidance. Although theoretical interpretations of avoidance conditioning must take Herrnstein's analysis into account, this does not necessarily have any implications about the similarity between avoidance responses and phobias.—*Journal abstract.*

9215. **Rappaport, Herbert.** (State U. New York, Buffalo) **The modification of avoidance behavior: Expectancy, autonomic reactivity, and verbal report.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5635.

9217. **Spain, John L.** (U. Tennessee) **An evaluation of demand characteristics with "normal" snake phobic subjects.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5642-5643.

9218. **Yen, Sherman.** (Greater Baltimore Medical Center, Md.) **Operant therapy for excessive checking.** *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 194-197.—Evaluated a specific therapeutic approach to the treatment of excessive checking things behavior (obsessive compulsive disorder). S was an 18-yr-old high school graduate who had failed to respond to traditional therapy. The strategy was to integrate inconvenient consequences as a part of S's

self-control behavior and to delay the occurrence of the deviant behavior. When to increase the intensity of inconvenient consequences to produce a facilitation of the weakening process is discussed. A follow-up study indicates that the present approach is clinically effective. (French summary)—*Journal abstract.*

Special & Adjunctive Therapy

9219. **Boenheim, Curt.** (Columbus State Hosp., O.) **The position of art therapy within contemporary psychotherapy.** *American Journal of Art Therapy*, 1970(Apr), Vol. 9(3), 107-114. Modern developments in the larger field of dynamic psychotherapy have opened up new opportunities for art therapy. Art therapy will soon be able to stand both as a method of treatment and as a profession on an equal footing with any of the nonmedical specialties operating in the broad field of psychotherapy. Art therapists need to develop alternative modes of practice which will be sensitive to varying conditions under which they work. Art therapists need to identify their own unique contributions and should not imitate outdated psychiatric models. *H. J. McWhinnie*

9220. **Bour, Pierre.** **Objet Intermédiaire et psychodrame.** [Intermediate object and psychodrama.] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 742-750.—Takes the position that in all situations of affective block between 2 persons, the use of an intermediate object may serve as a bridge. These objects represent in concrete form some symbolic value to which the person or patient may relate, e.g., the elements of earth, air, fire, and water may take the form of a lump of clay, colored balloons, a candle flame, and a basin of water. To be effective the specific concretizing object mediating between 2 persons must be chosen simultaneously by them both in the wish to draw closer and despite the irrational affective distance which separates them. This reciprocal choice is made, at the outset, in silence. This object is then revealed to others in the group. The shared object becomes the common object that may help to tunnel through the seeming mountains of uncrossable obstacles to communication (e.g., schizophrenic mutism) and bring about the beginning of affective exchange.—*H. E. King.*

9221. **Dengrove, Edward.** **The mechanotherapy of sexual disorders.** *Journal of Sex Research*, 1971(Feb), Vol. 7(1), 1-12. Discusses the uses of the artificial penis, a constricting device, the vibrator, and the Kegel perineometer in the treatment of impotence and frigidity. These devices are used not only as therapeutic instruments but to increase satisfaction with the sexual act for those who are not securing it. *I. B. Jaffe*

9222. **Gruenewald, Doris.** (Michael Reese Hosp., Chicago, Ill.) **Transference and countertransference in hypnosis.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Apr), Vol. 19(2), 71-82. Presents spontaneous transference manifestations in experimental Ss during assessment of hypnotizability and in Ss in the beginning stages of hypnototherapy in the context of their management and utilization. 7 case histories are described. Countertransference issues are examined. (Spanish & German summaries) (17 ref.)—*Journal abstract.*

9223. **McClaskey, Harris C.** (U. Washington) **Bibliotherapy with emotionally disturbed patients: An experimental study.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5205-5206.

9224. Simon, Rita M. The significance of pictorial styles in art therapy. *American Journal of Art Therapy*, 1970(Jul), Vol. 9(4), 159-176. Offers an approach to art therapy which uses pictorial content and style as a means of personality assessment. Pictorial analysis and therapy. Pictorial content is discussed and 4 basic types of pictorial style are illustrated. It was hypothesized that pictorial style provides a reliable mirror of a person's habitual attitudes toward life. Perception and understanding of style are essential for the art therapist. The hypothesis was tested by having 10 art students in which the favorable outcome of treatment followed by the assumption that a particular painting reached to the heart of the patient's problem. This recognition and the art therapist's ability to bring the pictures' meaning into focus for the patient depended on both on her knowledge of familiarity with the characteristics of various pictorial qualities and the complex interplay of manifest content, latent content, and artistic style. *H. J. McWhinnie*
9225. Smith, Heather. An essay validating Dr. Stafford Clark's statement that occupational therapy "is an active method of treatment with profound psychological justification." *Australian Occupational Therapy Journal*, 1970(Oct), Vol. 17(4), 29-31. Considers that the treatment offered by the occupational therapist to patients in a psychiatric hospital is a dynamic process, where activities and the relationships evolved through these activities, allow the patient to uncover and express basic needs, drives and feelings and the means of gratifying these either direct or symbolically are then provided by the therapist. Various activity programs are described for patients suffering with obsessional neurosis, schizophrenia, psychosis, depression, and alcoholism. (24 ref.) *S. Anapp*
9226. Starker, Steven. (Marion Prince Clinic for Hypnotherapy, New York, N.Y.) An application of the hypnotic serial fantasy technique. *International Journal of Clinical & Experimental Hypnosis*, 1971(Apr), Vol. 19(2), 66-70. Applied the hypnotic technique of serial fantasy to the problem of resistance to treatment. When an adult female S became resistive, she was asked to relate serial fantasies while under hypnosis and then, in the waking state, to free-associate to them. The material elicited contained striking symbolic representations of the resistance, quickly enabling the S to appreciate the degree and manner in which she resisted, as well as why she needed to do so. This method is suggested as a useful hypnotherapeutic device for dealing with resistance. (Spanish & German summaries.) *Journal abstract*
9227. Taplin, Julian R. (Olympic Center for Mental Health & Mental Retardation, Bismerton, Wash.) Crisis theory: Critique and reformulation. *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 13-23. Critiques the building of a "crisis theory" by using pure homeostatic notions or psychoanalytic constructs. A review of crisis observations and their implications indicates that a cognitive perspective can serve as a theoretical framework. It is argued that several worthwhile possibilities follow from the use of a cognitive perspective: (a) approach to research definitions about crisis; (b) an approach to conceiving of crisis intervention; (c) a series of new ways in manpower; and (d) a broad approach to crisis prevention. A philosophy of science note supporting the looser perspective (vs. tighter theory) is offered. (53 ref.) *Journal abstract*
9228. Vogler, Roger E., Lunde, Stanley E., & Mack, Patrick L. (State Hosp.) Electrical aversive conditioning with chronic alcoholics: Follow-up and suggestions for research. *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 450-459. Reports a follow-up of a study by R. Vogler, S. Lunde, & C. Johnson and P. Martin (see PA, Vol. 44, 1459) on drinking behavior in chronic alcoholics 1 yr. after release from a hospital. Ss had been subjected to response-contingent electrical shock, random shock, sham or no shock, and 3 treatments. Ss were studied at 2, 4, 6, 8, 10, and 12 days to 1st rehospitalization, 12 months after rehospitalization, and (c) number of days in hospital. Conditioned Ss did not differ significantly from the random shock group, although the latter group means on all 3 criteria were better than the former. Conditioned and random shock groups were significantly more improved than the other groups. Results indicate that conditioning produced lasting effects and suggest that non-response-contingent shock may be as effective as response-contingent shock in controlling drinking. *S. Anapp*
9229. Wolff, D. L. (U. Queensland, Brisbane, Australia) Occupational therapy: An aid in the diagnosis and treatment of environmentally retarded children. *Australian Occupational Therapy Journal*, 1970(Oct), Vol. 17(4), 19-26. Discusses the finding that children who spend a great part of their early years in institutions or who suffer inadequate mothering or subsequent emotional and environmental deprivation often show retarded development. Although a number of these children are diagnosed as mentally retarded, the author considered that the term "environmental" retardation may be more suitable since it denotes the possibility of reversal of the process. Environmental retardation may be diagnosed by observation in occupational therapy development assessment using Gesell's methods, and through analysis of histories revealing inappropriate characteristics. 2 case histories are presented of a 2-year-old boy and a 2-year-old girl. The diagnosis and treatment used to overcome developmental lags are described. *—Journal summary*

Drug Therapy

9230. Bastié, Y. Indications du sulpiride dans l'alcoolisme. [Indications for sulpiride in alcoholism.] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 23(405-406). The chemical nature of sulpiride (dogmatil, 405-406). The chemical nature of sulpiride (an antidepressant both neuroleptic and thymoanaleptic (an antidepressant without sedative action)) suggested its use with some of the complex interminglings of the problems of character, mood and behavior often found in alcoholism. Sulpiride was prescribed systematically for a large sample of alcoholics whenever a psychotropic agent was deemed necessary. Illustrative examples are given of alcoholism with depression, alcoholism with aggression, and other alcoholism with opposition to disintoxication, and other forms. The acute problems of chronic alcoholism (e.g., delirium) are better managed by the classic association of haloperidol-equanil. The special interest of sulpiride is its effectiveness with those Ss emerging from acute episodes who remain apathetic, aboulie, and depressed. This drug acts rapidly, an advantage for brief hospitalizations. Tolerance is good and there is no secondary somnolence. The psychotropic effect is complex, acting on depression, opposition to treatment, and the conduct

disorders. In addition to its current use for acute and chronic psychoses, depressions, and serious behavior disorders, sulpiride may be employed to advantage against the ordinary psychological problems accompanying chronic alcoholism.—*H. E. King.*

9231. Bastié, Y. **Suppression des crises d'épilepsie du sevrage par le dékapike dans les cures de désintoxication éthylique.** [Suppression of the epileptic crises of withdrawal by dekapine in cures of ethyl disintoxication.] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 400-404. Epilepsy on withdrawal is a relatively frequent complication at the beginning of ethyl disintoxication, after occurring in Ss without a history of convulsions. It differs from the prodromal attacks of delirium tremens and the epilepsy symptomatic of alcoholic mental deterioration. Withdrawal epilepsy is reversible and unaccompanied by electrical perturbations and does not indicate that the S is truly epileptic. It does not continue if abstinence is maintained. The mechanism is a lowering of the convulsive threshold, a cerebral hyperexcitability secondary to the abrupt removal of alcohol which has exerted a sedative effect. Typically, a grand mal seizure occurs within 48 hr. Dekapine given as soon as possible on hospitalization and continued for 1 wk. was effective against this risk. The drug was well tolerated and caused no secondary effects among 545 cases observed. Treatment produced virtual disappearance of withdrawal seizures, a notable improvement over the 2.5% expectancy rate for such populations.—*H. E. King.*

9232. Bauer, G. & Nowak, H. (University Psychiatric-Neurological Clinic, Innsbruck, Austria) **Doxepin, ein neues Antidepressivum: Wirkungsvergleich mit Amitriptylin.** [Doxepin, a new antidepressant: Comparison of activity with amitriptyline.] *Arzneimittel-Forschung*, 1969(Oct), Vol. 19(10), 1642-1646.—Compared the chemically and pharmacologically similar substances doxepin and amitriptyline in a double-blind trial with 20 patients. Clinical and statistical analyses showed great similarity between the substances. Remissions were effected in $\frac{1}{2}$ of the Ss. Antidepressive and sedative effects were equally strong. Chronic depressions were not influenced as well by doxepin as acute ones. The side effects of doxepin are a result of its anticholinergic property and of no special damage to the S. Changes of the serum transaminases and the alkaline phosphatase during treatment should be noted. (24 ref.)—*English summary.*

9233. Biéder, J. (Bailleul Psychiatric Hosp., France) **Implications des médicaments-retard.** [Implications of delayed medication.] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 424-427.—Delayed-action medications have been used in endocrinology, in treating alcoholism, and for the application of neuroleptic agents. Their use entails several forms of subtle risk: the introjected substances, acting independently of the patient's will, furnishes ready material for paranoid thinking; therapeutic failures may not be observed properly, and responsibility is often shifted from "the patient who would not take his treatment" to "the physician who gave the wrong treatment." Perhaps the best use of the method is just prior to leaving the hospital, as a demonstration of control of the illness. It will not guarantee the patient's adherence to a prescribed regimen, but it will permit deviations from the ideal medication program to be taken at the least risk.—*H. E. King.*

9234. Carrère, J. (Villejuif, Psychiatric Hosp., Paris, France) **Action restructurante du sureptil dans les composantes anxio-dépressives d'états involutifs.** [The restructuring action of sureptil on anxiety-depressive components of involuntal states.] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 409-419. The powerful and long-acting vasodilatory effects of sureptil were tested on a group of 53-85 yr. old psychiatric patients, without regard to original diagnosis. Psychological status was evaluated by the Overall and Gorham Brief Psychiatric Rating Scale applied before treatment and again 3 and 6 wk. after the 1st evaluation. A psychological test battery (derived from extracts of the Wechsler-Bellvue Intelligence Scale, Binet-Simon batteries, Kohs' Block-Design Test, Benton Visual Retention Test, and the Bender Gestalt) was applied before and at the end of the therapeutic trial. The clinical effects, on the whole, indicate sureptil to be active and useful against motor slowness, anxiety, conceptual disorientation, tension, and affective blunting. The beneficial action is at times paradoxical, with improvement sometimes following transient worsening or the reverse. Sureptil has a polyvalent action favorably affecting the anxiety and depressive components, and the behaviors that result from them, among chronic older psychiatric patients. —*H. E. King.*

9235. Delay, J., Lemprière, T., & Féline, A. **Essais du pirodixilate en thérapeutique psychiatrique.** [Trials of pirodixilate in therapeutic psychiatry.] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 606-613.—Pirodixilate acts as a regulator of cellular respiration. Because its mechanism is exclusively biochemical, affecting the use and consumption of oxygen rather than producing any circulatory changes, it has been found useful as a protective treatment in neurosurgery, e.g., in the management of posttraumatic comas or cerebrovascular accidents. An experimental application of the drug to 35 psychiatric patients is reported. Ss were organic patients, chronic psychotics, and a small group of neurotics. $\frac{1}{2}$ the organic Ss were unaffected. $\frac{1}{2}$ showed moderate improvement in ability to concentrate and in memory function, and $\frac{1}{4}$ showed a good therapeutic result, i.e., improved concentration, memory, and intellectual functioning. Virtually all of the psychotic patients had prior treatment with neuroleptic drugs which were effective, but lingering problems of attention, intellectual integration, and a poverty of interest had prevented their return to full social roles. Most of these patients were improved ($\frac{1}{4}$ was unaffected) by beneficial influences on initiative, contact with others, distractibility, and intellectual and memory integration. Used conjointly with psychotropics, pirodixilate provides a useful approach to certain residual psychotic states. The effect on neurotic patients was inconclusive but seemed generally favorable and benign. —*H. E. King.*

9236. Fischbach, R. (Salzburg State Nerve Clinic, Neurological Div., Austria) **Der Einfluss der Thymoleptica auf die Säureproduktion des Magens.** [The influence of thymoleptic drugs on the acid production of the stomach.] *Arzneimittel-Forschung*, 1969(Oct), Vol. 19(10), 1640-1642. During therapy with thymoleptic drugs in 38 depressive patients, acid production and stomach secretion were studied. A growing loss of acidity involving both "free" and "total" acid was noted. It was accompanied by decreased absorption of drugs of the imipramine series, which could be compensated by acid substitution. (15 ref.) —*English summary.*

9237. **Gorceix, A. & Jacquemin, C.** *Intérêt du pyrovalérone dans le traitement ambulatoire des états de fatigue.* [The interest of pyrovalerone for the ambulatory treatment of fatigue states.] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 624-632. The reduction of fatigue states has long been a hope in psychiatry and general medicine, but the use of stimulants such as amphetamines has proved both delicate and dangerous. Metals and substances have generally failed to show the least evidence of effective action. The therapeutic search for an effective treatment of exhaustion continues, however, just as the target symptoms of agitation were finally reached by the neuroleptics and depression yielded to thymomimetic agents. Pyrovalerone (L. J. 424) was applied to 15 patients, too heterogeneous in kind to allow a strict statistical data analysis. The responses of individual illustrative cases are described, which are varied in nature and often mixed with a possible response to other simultaneous medication. The usefulness of the present exploratory study lies more in a demonstration that the treatment can be most effective with certain patients, and that the drug is well-tolerated without producing troublesome secondary effects. To influence fatigue, which the authors regard as a limited form of clouded consciousness, a neuroleptic agent is needed to assure full awareness without excess mobilization of tension or the revival of anxiety. Pyrovalerone is held to be an interesting step along this therapeutic way.—*H. E. King*

9238. **Ham, Roberto, et al.** *Fray Bernardino Alvarez Psychiatric Hosp. Mexico D.F. La propericiazina en el tratamiento de trastornos de conducta infantil.* [Propericiazine in the treatment of disturbed infantile behavior.] *Revista de la Clínica de la Conducta*, 1969(1 feb), Vol. 2(4), 28-32. Investigated the therapeutic effects of propericiazine (a piperidine phenothiazine) in children with behavior disturbances. Data confirm findings from France: the effect on child behavior disturbances was superior to that found with other neuroleptics. The tolerance rate was high, even though the dose in some cases was 3 times that used in Europe. The drug was administered in drops, in doses of 5-15 mg 3 times/day. Children with behavior disturbances due to brain damage improved more than is usual with other phenothiazines. Drowsiness was a frequent side effect, but only occurred with the 1st doses. Results, including etiology, age, and symptoms, are presented in chart form (French summary)—*English summary*

9239. **Handlarz, Mario C.** (U. Buenos Aires, Medical School, Argentina) *Nuestra experiencia con el uso de la litoridazina en el tratamiento de los estados depresivos.* [Our experience with thioridazine in depressive states.] *Acta Psiquiátrica y Psicológica de América Latina*, 1971(1 feb), Vol. 17(1), 39-45. Describes the use of thioridazine with 49 depressive patients who had not responded to other treatment procedures, including electroshock therapy. The drug was effective in the control of hallucinations, anxiety, and emotional tension; there was also improvement in judgment and comprehension, and a decrement in hostility.—*J. A. Colotta*

9240. **Léger, J. M., Garoux, R., & Drucker, H.** (U. Limoges, Hosp. Center, France) *Remarques sur l'utilisation de la clomipramine (anafanil) dans certaines psychoses délirantes aiguës (sans élément dépressif net).* [Remarks on the use of

clomipramine (anafanil) in acute delusional psychosis (without depressive element).] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 777-784.—Reports the use of clomipramine with delusional psychosis and acute delusional psychosis admitted to a psychiatric service because of an acute episode. A dosage of 100-150 mg was given 3 times a day, sometimes accompanied by a neuroleptic. The results were found for 12 of 15 patients. The best responses were obtained among those presenting clinical pictures of strong inhibition and passivity (catatonia, difficulty with contact). Among those when present, was unpleasant excitement, which seemed to change to a form more sensitive to treatment by neuroleptic or electroshock treatment. The drug also had a favorable action on improvement of the delusions of persecution. While the delusional action was rapid, only a matter of days to weeks, the delusions was much slower, requiring several weeks. The mode of action is discussed in an effort to understand these positive clinical findings.—*M. E. King*

9241. **Maggi, C., Murri, M., & Sacchetti, G.** (Pisa Inst. of Clinical Psychiatry, Italy) *Evaluation of the effectiveness of temazepam on the insomnia of patients with neurosis and endogenous depression.* *Archivum Psychiatricum*, 1969(Oct), Vol. 19(10), 161-162.—Describes the clinical and polygraphic changes induced in the sleep pattern of 8 Ss with endogenous depression or catatonia by a new derivative of benzodiazepine, i.e., 7-chloro-1,3-dihydro-1-methyl-5H-2,4,6-triazepin-2-one (temazepam). This drug proved useful in the treatment of initial and middle insomnia and in improving the subjective assessment of sleep defined by the Ss as "restful" and "refreshing." It is suggested that these changes of sleep approach reflect an increase of REM stage duration. (German summary)—*Journal summary*

9242. **Nates Rodriguez, Daniel.** (Children's Hosp. of Mexico, Mexico, D.F.) *Las psicodrogas en pediatría.* [Psychotropic drugs in pediatrics.] *Revista de la Clínica de la Conducta*, 1969(1 feb), Vol. 2(4), 5-21.—Relates experiences in the treatment of children with psychotropic drugs. The nerve structures whose functioning is responsible for conduct changes are described. Biochemical aspects for consideration when psychotropic drugs are used are noted. Psychotropic drugs are classified and evaluated for their use in child psychiatry. Doses and toxicity are discussed. The following groups of drugs are considered: (a) sedatives, (b) major tranquilizers, (c) minor tranquilizers, (d) antidepressants (MAO inhibitors), (e) stimulants, and (f) various metabolites. (French summary)—*English summary*

9243. **Ostapitzeff, G. & Ostapitzeff-Lavoine, M.** *propos du syndrome neuroleptique.* [On the neuroleptic syndrome.] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 614-617.—Ever since the neuroleptic drugs became a part of the panoply of psychiatric treatments their secondary effects have been known. The extrapyramidal phenomena produced have become, in fact, one of the identifying criteria for neuroleptic activity. This paper describes 4 patients who interpreted the secondary drug effects on their bodies as part of their personal psychological experience. The trembling of limbs or difficulty with chewing or salivation became a part of the patient's delusional

system; e.g., a trembling leg was said to be moved by "the little beasts within." The secondary symptoms become integrated with the rest of the personality and may also be invested with a private significance bearing on their relation to their physician. The latter should recognize that a kind of message may be directed toward him and not reject it by neurologizing it. — *H. E. King.*

9244. Porot, M., Couadau, A., Plenat, M., & De Mori, Y. Essais cliniques du thiothixène, neuroleptique désinhibiteur. [Clinical trials of thiothixene, neuroleptic disinhibitor.] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 618-623.—Reports the use of thiothixene (navane) with 20 patients selected for obsessional neurosis or schizophrenic inertia, 2 psychopathological states resistant to most forms of psychiatric treatment. Clinical response, typically rapid, varied from $\frac{1}{3}$ excellent and $\frac{1}{3}$ good to $\frac{1}{3}$ ineffective. Patient groups were similar in age and sex. Best reactions were found with problems of most recent origin and results were particularly favorable for hebephrenic and catatonic states. Simple schizophrenic and heboidophrenic patients in which a certain level of activity is maintained were not favorably indicated for thiothixene therapy. As the problems of most patients treated were long-standing and had been subject to prior treatment without beneficial result, thiothixene appears to be a neuroleptic disinhibitor of special value for those atonic, apraxic schizophrenias heretofore condemned to inactivity and distressing passivity.—H. E. King.

9245. Rickels, Karl, et al. (U. Pennsylvania) **Drug, doctor warmth, and clinic setting in the symptomatic response to minor tranquilizers.** *Psychopharmacologia*, 1971, Vol. 20(2), 128-152.—Conducted a collaborative double-blind clinical trial, concerned with the importance of the "doctor variable" for drug treatment outcome, with 485 anxious neurotic outpatients receiving either chlordiazepoxide, meprobamate, or placebo. 3 clinics participated, and the doctor variable selected for presentation was "doctor warmth." Data on the 169 Ss completing the 4-wk study were analyzed using a factorial analysis of covariance procedure. Results indicate that (a) several main drug effects, present only at 2 wk., indicated chlordiazepoxide to produce significantly more improvement than meprobamate or placebo; (b) several main warmth effects, present only at 4 wk., showed that Ss who initially rated their physicians as "warm" improved significantly more than Ss rating their physicians as "nonwarm"; and (c) several significant Drug \times Clinic interaction effects at 4 wk. indicated that although hardly any drug differences were seen in 2 clinics, at the 3rd clinic, Ss strongly favored chlordiazepoxide. Drug and warmth effects were particularly marked in initially sicker Ss, and warmth appeared especially important in the improvement of initially sicker placebo Ss. (26 ref.)—*Journal abstract.*

9246. van Praag, H. M., Schut, T., Bosma, E., & van den Bergh, R. (State U., Psychiatric Clinic, Groningen, Netherlands) **A comparative study of the therapeutic effects of some 4-chlorinated amphetamine derivatives in depressive patients.** *Psychopharmacologia*, 1971, Vol. 20(1), 66-76.—The compounds 4-chloro-N-methylamphetamine (CMA) and 4-chloroamphetamine (4-CA) are probably depletors of 5-hydroxytryptamine (5-HT). This has been demonstrated as plausible in human Ss also. In rat brains, the 5-HT depleting potency of 4-CA exceeds that of CMA. In depressive patients, moreover, CMA behaves as an antidepressant. In view of

these findings the following hypotheses were tested in a study with 29 depressive patients: (a) If there is any correlation between the 5-HT depleting potency of CMA and 4-CA and their antidepressant potency, then the therapeutic potency of 4-CA must be expected to exceed that of CMA. And (b) in view of the hypothesis of A. Carlsson and associates, that the motor activating effect of antidepressants is of largely noradrenergic determination, and their mood-improving effect largely serotonergic, the effect of CMA and 4-CA on mood can be expected to be small, and their effect on mood more or less selective. No unequivocal confirmation of these hypotheses was found. The possible causes of this failure are discussed. (30 ref.)—*Journal abstract.*

9247. Velasco Fernández, Rafael, et al. (Clinic of Behavior, Mexico, D.F.) Estudio piloto con RO 5-4556 en los trastornos de conducta de los niños en edad escolar. [Pilot study with Ro 5-4556 in the disturbed behavior of school age children.] *Revista de la Clínica de la Conducta*, 1969(Feb). Vol 2(4), 22-27. Investigated the use of a new psychotropic drug, Ro 5-4556 (nobrium) in a clinic. 36 school age children with different types of behavior disturbances were treated for an average of 3 mo. with doses ranging from 10-40 mg/day (1-15 mg/kg). The drug proved to have scarcely any toxic effects and was highly effective in the treatment of (a) sleep problems, (b) enuresis, (c) anxiety, and (d) hyperactivity. (French summary)—English summary.

HOSPITAL CARE & INSTITUTIONALIZATION

9248. Ancona, Leonardo; Cagliardi Guidi, Rosanna, & Strolago, Emilia. (Catholic U. of the Sacred Heart, Milan, Italy) **La dinamica del campo sociale post-edipico nella strutturazione dell'identità personale.** [Dynamics of the post-oedipal social field in the structuring of personal identity.] *Contributi dell'Istituto di Psicologia*, 1970, Vol. 30, 46-69. Psychosexual development of institutionalized boys was profoundly different from that of their controls. The former showed a rather archaic, primitive, and depressive level characterized by guilt feelings, sense of abandonment, narcissistic orientation, and a prevalently feminine identification. Institutionalization reduced productive discharge, decreasing achievement motivation and increasing fear of failure. (23 ref.) *I. L'Abate*

9249. Azoubel Neto, David & Roberto Borges. Ideo. (Inst. Ribeirão Preto, São Paulo, Brazil) **Organização e funcionamento de um hospital diurno em uma clínica particular.** [Organization and operation of a day hospital in a private clinic.] *Acta Psiquiátrica e Psicológica de América Latina*, 1971(1 feb). Vol. 17(1), 33-38. Describes a day hospital for psychiatric patients in a private clinic, stressing the functions of the staff members, the techniques employed, and the philosophy of treatment. Group psychotherapy and occupational therapy are the central points in the program. Reports on the 1st yr. of operations of the day hospital and provides statistical and epidemiological data on the patients admitted.—English summary.

9250. Bièder, J. (Baillieu Psychiatric Hosp., France)
La fonction cloacale des hôpitaux psychiatriques.
[The cloacal function of psychiatric hospitals.] *Annales
Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 419-424.
—Sociological analyses of the psychiatric hospital have
at times compared its role to that of the concentration

camp. Here, their function is seen differently, since the concentration camp has for its goal the elimination of its inmates while the psychiatric hospital has an absolute obligation to keep the interned alive. Its worst scandals are either suicide or escape. The principal reason for this unfortunate role or duty is not so much to eliminate the unwanted from society as to remove the un-understood, untreatable, or troublesome patient from the general hospital. It is used as the cloaca of the medical body. The "psychiatric alibi" is all too often invoked because a patient is agitated, or provokes a nurse, or because a lack of funds places him on an irreversible course toward the psychiatric facility. 2 possible remedies are suggested. (a) For the short-term, a mandatory delay within a general hospital before a psychiatric transfer is assured. (b) For the long-term, an extension of the critical examination of all clinical and life circumstances affecting the patient into the medical-administrative practices of the general hospital itself.—*H. E. King.*

9251. **Bosch, Gregor.** (U. Frankfurt/Main, Neuro-clinic, W. Germany) *Zur Frage des Abbaus von Zwangseinweisungen.* [On the question of reducing compulsory admissions.] *Nervenarzt*, 1971(Feb), Vol. 42(2), 65-74.—Argues that compulsory or involuntary admission of psychiatric patients for treatment has undesirable consequences and can be significantly reduced when the clinic provides the proper sort of therapeutic milieu. Much supporting statistical data are presented which were obtained from the records of the clinic established by the author at the Department of Social Psychiatry of the University of Frankfurt's Nervous Disease Clinic. Voluntary vs. involuntary admissions are compared for various diagnostic categories, for 1st vs. 2nd admissions, as a function of the duration of illness, etc. It is concluded that the concept of compulsory admission does not have to be accepted as intrinsically necessary. (31 ref.)—*E. R. Wist.*

9252. **Hagberg, Katherine L.** *Social casework and group work methods in a children's hospital.* *Children*, 1969(Sep), Vol. 16(5), 192-197.—Describes a combination of social work methods in a voluntary hospital for chronically ill children up to 19 yr. of age. Methods used with teen-agers are elaborated, including setting up a teen-age council for government and planning activities, group activities and group play sessions used with younger children, and the setting up of parents' groups.—*D. T. Lekarzyk.*

9253. **Hazemann, R. H.** *Gigantisme hospitalier.* [Hospital gigantism.] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 321-342.—The tendency of modern cities and industries toward gigantism brings anonymity and impersonality and the ruin of human contact in the indifference of bureaucracy. Illnesses of the spirit, reflected in the neuroses and by psychosomatic complaints, express the resultant suffering by both the individual and collective organisms. Hospitals themselves have become too large, a practice usually justified on a cost basis. Beyond a certain optimum of beds this is not borne out, however, and offers no excuse for the damage done to humanity by gigantism. The proper size for a hospital is a function of many factors (the region served, the division by specialty, etc.), always including the psychological needs of both the patients and the hospital personnel concerned. It is recommended that general hospitals not exceed 400 beds and that university hospital centers include no more than 600-800 beds. The psychiatric hospital should be limited to 250-300 beds.

Preferred sizes for other speciality hospitals are mentioned as is a distribution plan for affiliated institutions.—*King.*

9254. **Kriauciunas, Romualdas.** (Kankakee Hosp., Ill.) *Age and sex differences in reasons for psychiatric hospitalization.* *Gerontologist*, 1969, Vol. 9(3, Pt. 1), 221-222.—The results of a retrospective study, based on 387 Ss, suggest that destructive behavior as a stated reason for psychiatric hospitalization is more frequent for men and for young adults regardless of age. Furthermore, admission due to management of physical illness seems to become more frequent with increasing age.—*Journal summary.*

9255. **Lawson, Robert B., et al.** (U. Vermont) *Token economy program in a maximum security correctional hospital.* *Journal of Nervous & Mental Disease*, 1971(Mar), Vol. 152(3), 199-205.—Reports on an attempt to implement a token economy program in a correctional hospital. 41 low functioning male patients were studied regardless of diagnostic record or criminal offense. Patients selected were indifferent, apathetic, dependent, and institutionalized. Results indicate that behaviorally inactive patients engaged in reinforcement activities in order to gain access to a variety of reinforcers. Token economy programs can be an effective treatment method in a maximum security correctional hospital.—*Journal abstract.*

9256. **Martin, A., et al.** *L'esthéticienne à l'hôpital psychiatrique.* [The esthetician in the psychiatric hospital.] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 427-432.—The role of the esthetician, one who assists or counsels in the techniques of personal grooming and care, is deemed of importance as a link in the contact of the psychiatric patient with the social world and with significant others in her personal life. 2 aspects of today's care programs bring to the traditional need to the fore: the short hospital stay with its continuous visiting privileges, and some of the effects of psychotropic drug treatment programs which may call for special counteractive efforts (to deal with skin discolorations of thickenings, and the like). Patients appreciate the entry of these "representatives of the outside world" within the hospital and the aid thus given to assure a resumption of their social lives at discharge. They represent a tangible evidence of the humanization of the hospital with an orientation toward the doors of the world outside.—*H. E. King.*

9257. **Morton, W. Duke; Lantz, Alma, & Halpern, Joseph.** (3520 W. Oxford Ave., Denver, Co.) *Readmissions: Methodology and meaning.* *Journal of the Fort Logan Mental Health Center*, 1970(Spring), Vol. 6(1), 1-22.—Presents various methods of calculating readmissions to a psychiatric hospital based on a study of 2,198 patients. Methods considered include (a) ratio of readmissions to total admissions, (b) ratio of readmissions to subsequent readmissions of the same patients, and (c) cumulative percentages of readmissions. Methodological difficulties are described. The relationship between readmission rates and time in hospital, hospital environment, length of hospitalization, and time in the community, and personality characteristics to readmission rates are discussed. It is concluded that the various methods of calculating and describing readmission rates determine the extent to which such figures can (a) answer a given question, and (b) gauge the effectiveness of a hospital treatment program.—*Knapp.*

9258. **Rosen, Bernard; Klein, Donald F., & Ghitelman,**

neurological origin of Freud's dream theory. *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 59-74.—The impression is conveyed both in Freud's early and later writings that his dream theory arose in a strictly empirical and inductive manner from clinical observation of his patients. More recent endeavors, based on Freud's extensive correspondence with Fleiss, reveal that 4 yr before publication of *The Interpretation of Dreams*—Freud had attempted to construct a model of the psychic apparatus in strictly neurological terms. In particular, the dream theory seems to have been a logical and appropriate extension of neurological principles learned by Freud during his tenure as a neuro-physiologist. —C. M. Frank.

9266. Mattoon, Mary A. (U. Minnesota). **The theory of dream interpretation according to C. G. Jung: An exposition and analysis.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5205.

9267. Monserrat Valle, Leopoldo. **El mecanismo psicológico de identificación.** [The psychological identification mechanism.] *Revista de Psicología y Psicología Médica*, 1970(Apr), Vol. 9(6), 380-409.—Reviews the views of a large number of psychoanalytic authors, such as Fenchel, Ferenczi, Freud, Klein, Pearson, and others concerning the mechanism of identification, its relationship to other ego-defense mechanisms, types of identification, the dynamics of identification, the Oedipus conflict, the ego, the superego, and other related psychoanalytic concepts. (36 ref.) —L. Zúñiga.

9268. Paulsen, Lola. (20 Hyde Park Square, London, England). **Dreams and fantasies of falling.** *Journal of Analytical Psychology*, 1971(Jan), Vol. 16(1), 1-17.—3 aspects of dreams and fantasies of falling are stressed and supported by clinical material. The significance of dreams of falling was isolated within the general context of anxiety states, forebodings, and panics. Transference was highlighted. The nature of the fall is discussed as a true symbol, in light of other studies and personal experiences with patients. (16 ref.) —P. Feldman.

9269. Ravbin, James B. (U. Colorado Medical School, Denver). **The curse: A study in family communication.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 617-625.—Discusses the curse or sinister prophecy, from the viewpoint of its role in family communications. Illustrations are presented from 4 families. The creation and maintenance of a curse as part of a larger family mythology involves individual problems in identification and magical thinking, as well as family problems of homeostasis and the transmission of irrationality. Therapy of individuals and families caught up in a mythological system is an arduous task, as there is much resistance to change what is often seen as one's inevitable fate. (71 ref.) —*Journal abstract.*

9270. Rycroft, Charles. (50 Wimpole St., London, England). **El simbolismo y su relación con los procesos primario y secundario.** [Symbolism and its relation to primary and secondary processes.] *Revista de Psicología*, 1970(Apr), Vol. 27(2), 365-392.—Examines the relationship between symbolic processes and ego function, noting Freud's initial ideas on differences between primary and secondary processes, with particular reference to Winnicott and Milner on illusion. Reasons which imply that limiting symbolism to the use of symbols in the primary process is incompatible with Freudian theory on the nature and development of ego

are discussed. A theory on symbolism is presented on basis that symbolism constitutes a general meaning process. —P. Hollberg.

9271. Sharpe, Ella F. **Problemas psicológicos revelados en el lenguaje: Un examen de la metáfora.** [Psychological problems revealed in language: A study of the metaphor.] *Revista de Psicología*, 1970(Apr), Vol. 27(2), 393-401.—Discusses the metaphor as a verbal phenomenon in which sensory experience and thought are fused on a verbal level. The general circumstances in which the evolution of the metaphor is illustrated by clinical material. The metaphor is shown to evolve in conjunction with a central affective process with emotions originally found in bodily discharges finding substitute channels and matrices. The influence of pregenital stages is believed to result in fixation on instinctual tension. —Hollberg.

PSYCHODIAGNOSIS

9272. Adams, Jerry. (William S. Hall Psychiatric Ins. Center, N.C.). **Defensiveness on the MMPI as a function of the warmth of test introduction.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 444.—Hypothesized that a warmer introduction to the MMPI would reduce defensiveness as measured by the K and F-K scales and permit the revelation of more psychiatric symptoms. Over a 7-mo period the MMPI with either a warm or cold introduction was administered to a total of 61 mothers and 47 fathers of children being evaluated in a child psychiatric clinic. The K scores were significantly higher and the F-K scores significantly lower for the cold-form group. Mothers who received the warm form scored higher on the F scale, while fathers did not differ across forms. It is concluded that, while an increase in honesty resulted from the manipulation of the forms, there was little evidence to indicate that there was also an increase in the acknowledgment of psychiatric problems. It is suggested that high K and low F-K scores, rather than indicating the covering up of symptoms, are an assertion of psychological health. —S. Knapp.

9273. Adis Castro, Gonzalo. (U. Costa Rica, Med. School, San José). **Salud mental, investigación y contexto socio-cultural.** [Mental health, research and socio-cultural context.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 181-189.—Research in the mental health field should take into account the socio-cultural context in which the investigations are carried out. The emphasis here is appropriate since very often one is confronted with a contradictory situation: on the 1 hand, there is acceptance of the fact that the individual must be viewed within his own socio-cultural context; and, conversely, research in this field indicates that the individual has been evaluated without taking into consideration the socio-cultural expectations of his own environment. Several examples are given to show the importance of studying and understanding the socio-cultural context in which epidemiological research in mental health is to be carried out. (16 ref.) —J. A. Colotta.

9274. Adis Castro, Gonzalo & Araya Quesada, Mario. (Chapui Psychiatric Hosp., San José, Costa Rica). **Mini-Mult: Una forma abreviada del inventario multi-fásico de la personalidad de Minnesota, MMPI.**

[Mini-Mult: A short form of the Minnesota Multiphasic Personality Inventory, MMPI.] *Acta Psiquiátrica y Psicológica de América Latina*, 1971(Feb), Vol. 17(1), 12-18.—A short form of the MMPI, Kincannon's Mini-Mult, was evaluated in a retrospective study. 40 MMPI protocols were randomly selected from the archives of a Costa Rican psychiatric hospital and the responses to the Mini-Mult questions were extracted from them. Local regression equations were employed to estimate the scores in the original MMPI scales: it was found that the error introduced by the short form tends to be relatively small. It is concluded that the Mini-Mult can be employed instead of the original form of the MMPI when there are time limitations or the educational level of patients is low.—*English summary.*

9275. Adís Castro, Gonzalo; Hernández Ureña, R., Viquez Carvajal, C., & Alvarenga Bianco, F. (U. Costa Rica, Medical School, San José) *Investigación epidemiológica en América latina: Prevalencia de problemas de salud mental en Costa Rica*. [Epidemiological research in Latin America: Prevalence of mental health problems in Costa Rica.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No.2, 89-114.—Psychiatric epidemiology in Costa Rica was evaluated by means of a questionnaire in a direct interview with a sample of 750 Ss: 650 were from a rural setting, and 100 were from an urban setting. The overall percentage of prevalence of psychiatric disorders (prevalence of urban and rural samples, respectively, are in parentheses) was: psychosis, 2.9 (6 and 2.5); personality disorders, 10.1 (13 and 9.7); psychoneurosis, 38.7 (28 and 40.2); psychophysical reactions, 28.1 (27 and 28.3); epilepsy, 2.2 (2 and 2.2); and alcoholism, 14.9 (24.4 and 13.2). The limitations of the study, including the small size of the samples, are indicated. (20 ref.)—V. A. Colotta.

9276. Bemporad, Jules R., Pfeiffer, Carl M., & Bloom, Wallace. (New York Medical Coll., Flower & 5th Ave. Hosp.) *Twelve months' experience with the GAP classification of childhood disorders*. *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 658-664.—Describes an assessment of the value of the new Group for the Advancement of Psychiatry (GAP) classification of childhood disorders, which took place after this system had been in use for 1 yr., during which time 310 children were seen. The GAP classification is compared with the *Diagnostic and Statistical Manual of Mental Disorders* (DSM) I and DSM II. While overall satisfaction with the GAP classification is expressed it is believed that certain changes are warranted. These changes are outlined.—*Journal abstract.*

9277. Bouchariat, J., et al. (U. Grenoble, Hosp. Center, France) *Le test du pays de la peur et du pays de la joie*. [The test of the "land of fear" and "land of joy."] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 589-605.—Describes a new projective test for children. It provides a view of defense mechanisms used to control anxiety created by a conflictual situation. The responses of 323 school-age children to instruction to draw "the land of fear" are counted and classified with reference to the representation of anxiety and the defense against it. Typical themes, e.g., aggression, insecurity, abandonment, and death, are described for different age and sex subgroups. Drawings of "the land of joy" elicit themes of action, interiors (houses, gardens), and renewal, e.g., holidays or the cycles of nature. Symbolic content is also identified and counted,

e.g., evil objects or cosmic symbols. The responses of 72 unstable children are analyzed, for cases of affect disorder, psychosomatic problem, neurosis, schizophrenia, and organic disorder. The abnormal children showed insecurity in the way their lands of joy were easily transformed into fear, unbalance in their treatment of real and imaginary elements, etc. Test responses relate more closely to the TAT than the Rorschach. The "fear-and-joy" test centers on elements scattered throughout other projective techniques making possible a more rapid and direct approach to the child's problem.—H. E. King.

9278. Cabildo Arellano, Hector M. (Dept. of Public Health, Mexico City, Mexico) *Investigación epidemiológica en América latina: Estado actual de la investigación epidemiológica en América latina*. [Epidemiological research in Latin America: Current status of epidemiological research in Latin America.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 126-139. Since the beginning of the century, the following epidemiological studies have been carried out in Mexico: 4 studies on homicide, 2 on suicide, 3 on juvenile delinquency, and 3 on mental disorders. The results of the last 3 studies showed that the overall percentage of prevalence of mental disorders in the population was 32.9. The percentage of prevalence of specific mental disorders was: psychosis, 1.01, senile psychosis, .31; alcoholism, .70; epilepsy, .30; mental deficiency, 1.22; neurotic reactions, 13.45; mild emotional disorders in children, 13.23; and severe emotional disorders in children, 3.05 (29 ref.)—V. A. Colotta.

9279. Calvi, Gabriele. (Catholic U. of the Sacred Heart, Milan, Italy) *Lo sviluppo di nuove direzioni esplorative nella ricerca e nella pratica psicodiagnostica*. [Development of new explorative directions in psychodiagnostic research and practice.] *Contributi dell'Istituto di Psicologia*, 1970(Vol. 30) 722-725. A rating scale for level of confidence in answering items by an S helps the examiner evaluate this dimension and increases the S's motivation, humanizing the test situation, and reducing the chances of errors. The role of response sets is also discussed.—L. F. Abate.

9280. Clum, George A., & Holberg, Anne L. (U. Virginia, Medical School) *Prognostic indexes in a military psychiatric population*. *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 436-440. Used biographical variables, available at the time of admission to a Navy psychiatric service, to predict the posthospital adjustment of 827 male patients (Navy and Marine Corps personnel) to military life. Predictor variables were combined, using a multiple regression technique and a simple item-analyzed scale. The latter proved to be slightly, but not significantly, more efficient than the multiple-regression procedure as judged from cross-validity correlations. Variables which were reliable prognostic indicators included (a) occupational specialty, (b) number of children, (c) wife's attitude, (d) solitariness of work, (e) length of service, (f) diagnosis, and (g) recognition for inservice achievements. While improvement in base-rate prediction was not possible, an increase in effectiveness rate for ex-psychiatric patients could be effected by selecting a high prognosis score as a requirement for returning a patient to duty.—*Journal abstract.*

9281. León, Carlos A., Climent, Carlos E., Estrada, Harold, & Jaramillo, Ramón. (U. del Valle Medical School, Cali, Colombia) *Investigación epidemiológica*

en América latina: Evaluación de instrumentos para el estudio de la prevalencia de trastornos mentales. Ensayo metodológico en una población semi-rural. [Epidemiological research in Latin America. An evaluation of the instruments available for the study of the prevalence of mental disorders: A methodological sample of a semi-rural population.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 64-88. To evaluate the screen ability of prevalence instruments in epidemiological surveys an abridged version of the Health Opinion Survey (HOS) and checklist of psychiatric symptoms were given to a probabilistic sample of adult inhabitants of a semirural town in Colombia. The results were validated by psychiatric examination of a stratified random subsample of respondents. It was found that HOS does not discriminate between sick persons and the general population; the checklist of symptoms was found useful in identifying mentally ill persons in a population, but was unable to indicate their type (15 ref.)—V. A. Colotla.

9282. Listiak, Richard L. & Stone, LeRoy A. (U. Nebraska, Medical School, Omaha) **Psychophysical approach to clinical judgment of low T scores on the MMPI.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 447. Presented randomly and individually T scores on the MMPI, ranging from 30-110, to 14 PhD clinicians in Minnesota and 18 clinicians in Kansas for evaluation of pathology. Ss showed low agreement on 2 scales (Pa and Ma) and were significantly different on 7 out of the 10 scales. Minnesota judges tended to regard low scores as representing less pathology and to view pathology in a linear manner. Limitations of the study are noted. S. Knapp.

9283. Marconi, Juan. (U. Chile, Medical School, Santiago) **Esbozo de modelos de valor epidemiológico para la investigación y la acción en América latina.** [Outline of epidemiological models for research and action in Latin America.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 161-179.—Mental health programs in Latin America are conceived on an Occidental-ethnocentric model, ignoring the cultures of the majority of the population. A cultural relativistic model is proposed disclosing the cultural barrier between European culture at the university level and mestizo-popular and aboriginal cultures, mental health being a problem activity approached by cultures on both sides of the barrier. 3 cultural models of medicine in Chile are described: European, popular, and Mapuche, emphasizing the need for a cultural relativistic approach to them.—V. A. Colotla.

9284. Marconi, Juan & Muñoz, Leonardo. (U. Chile, Medical School, Santiago) **Investigación epidemiológica en América latina: Visión general de la investigación epidemiológica en salud mental en Chile.** [Epidemiological research in Latin America: Epidemiological research on mental health in Chile.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 115-125.—Epidemiological research on mental health in Chile has been aimed at evaluating the prevalence of alcoholism and other mental disorders. Prevalence studies of types of drinkers indicate that for Chile adult alcoholics number 5% and child alcoholics, 1.6%. Epidemiological studies on the prevalence of other mental illnesses have been carried out in Greater Santiago (1958), in 3 social strata of the northern area of Santiago (1965-1966), and again in Greater Santiago (1967-1968). Alcoholism, neurosis, and

epilepsy increase in the lower socioeconomic strata. B. Greater Santiago studies show a raw prevalence estimate of around 18% mental disorders in the general population, neurosis and alcoholism being the most prevalent disorders. (18 ref.)—V. A. Colotla.

9285. Mariátegui, Javier. (Cayetano Heredia Peruvian U. Lima) **Investigación epidemiológica en América latina: Estudios de epidemiología psiquiátrica en el Perú.** [Epidemiological research in Latin America: Studies of psychiatric epidemiology in Peru.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 140-160. An epidemiological study was conducted in the District of Lince, in Lima, Peru, to evaluate the prevalence of psychiatric disorders. Questionnaires and interviews were employed with a sample composed of 4% of the families in the district. Prevalence of mental disorders was 18.7% of the sample; differences were found between the 2 social strata (middle and low) studied. The rate of prevalence found in this study is contrasted with the 42.6% prevalence found in Iquitos, Mendocita, in 1958. This discrepancy is discussed in terms of the social disorganization prevalent in the Iquitos zone. (25 ref.)—V. A. Colotla.

9286. Misyuk, N. S., Lepeshinskii, N. A., & Mastyluk, A. S. **Elementy avtomatizatsii diagnosticheskogo protsessa v nevropatologii.** [The elements of automatization of the diagnostic process in neuropathology.] Minsk, USSR: Belarus', 1970, 192 p. Recommends which diseases it is wise to detect with the aid of the electronic computer, with special attention directed to the algorithms which are utilized for diagnosing diseases of the human nervous system. Describes and illustrates 1 of the logico-probabilistic algorithms, proposed and tested by the authors for diagnosis of brain tumors. Diagnostic tables are supplied which facilitate the differential diagnosis of acute impairment of cerebral circulation. The possibilities of prognosis for acute disturbances of cerebral circulation are considered along with the development of new forms of primary medical documentation. (5 p. ref.)—J. London.

9287. Muñoz, Leonardo. (U. Chile, Medical School, Santiago) **El método epidemiológico: Algunos aspectos prácticos de su aplicación en psiquiatría.** [The epidemiological method: Some practical aspects of its application in psychiatry.] *Acta Psiquiátrica y Psicológica de América Latina Monograph*, 1970, No. 2, 13-42. Epidemiology is based on observation. The variables studied were: (a) the period of time the observed events lasted; (b) the place and circumstances in which these events occurred; and (c) the personal characteristics of the people involved, i.e., sex, occupation, education, etc. Epidemiology today, as applied to psychiatry, tends towards direct prevalence studies to determine the number of cases in a specific period. These studies can be either transversal or longitudinal, and frequency or rates most used in the epidemiology of chronic illnesses are the prevalence and incidence rates.—V. A. Colotla.

9288. Phillips, Leslie & Draguns, Juris G. (Boston Coll.) **Classification of the behavior disorders.** *Annual Review of Psychology*, 1971, Vol. 22, 44-482.—Reviews literature published between January 1966 and December 1969, stressing the polarities, tensions, and ambiguities in the area of classification of behavior disorders. Points discussed include (a) global objections to the system and model of diagnosis; (b) defense of traditional classificatory models; (c) proposals

these 2 diagnostic groups. A random sample of 58 (18 schizophrenes and 16 brain-damaged Ss) were selected for additional testing. The correlation between performance in the experiment and WAIS scores and also performance on 6 tests from the Reitan-Halstead Battery for diagnosing brain injury are reported. *Journal abstract.*

BEHAVIOR DISORDER

9297. Ferdon, Nona M. (U. Hawaii) **Chromosomal abnormalities and antisocial behavior.** *Journal of Genetic Psychology*, 1970(Jan), Vol. 118(2), 281-292.

Reviews relevant research in the area of superfluous or absent sex-determinant chromosomes in man and the relationship between such abnormalities and antisocial behavior. The possibility that psychological factors such as "intervening variables" may play an important role in explaining such correlations is suggested. (11 ref.)—*Author abstract.*

9298. Terr, Lenore C. (Case Western Reserve U. Medical School) **A family study of child abuse.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 665-671.—Evaluated 10 battered children and their families over a 6-yr period. It was found that important factors leading to abuse were fantasies of the abuser about the child, exaggerated dominant-submissive patterns in the marriage, and contributions of the child to the battering. Suggestions for using a family approach in treating battered children are offered. (15 ref.)—*Journal abstract.*

Drug Addiction

9299. Ball, J. R. **The drug addictions.** *Australian Occupational Therapy Journal*, 1970(Jul), Vol. 17(3), 15-23.—Defines various terms used to describe drug addiction: physical dependence, tolerance, and habituation. Statistics on the number of drug addicts are presented. The psychology and background of the potential and actual drug addict are discussed and a composite picture of a young, female drug addict is presented. A number of drugs are listed with brief descriptions of the effects and withdrawal symptoms. Drugs covered include (a) opiates, (b) marijuana, (c) amphetamines, (d) barbiturates, (e) paraldehyde, (f) bromides, and (g) diazepam. S. Knapp.

9300. Slobetz, F. W. (Morris J. Bernstein Inst., Beth Israel Medical Center, New York, N.Y.) **The role of occupational therapy in heroin detoxification.** *American Journal of Occupational Therapy*, 1970(Jul), Vol. 24(5), 340-342.—Describes the role of occupational therapy within the drug-addiction service in an institutional setting. Within this program nonverbal ego-building therapeutic procedures appear to be effective in providing evaluation and in the treatment of the patient's attitudinal patterns with particular regard to the "productive-work" experience. The effectiveness of occupational therapy in drug addiction that is being treated as a psychiatric problem is discussed.—M. A. Seidenfeld.

Alcoholism

9301. Bateson, Gregory. **The cybernetics of "self":**

A theory of alcoholism. *Psychiatry, Washington, D.C.*, 1971(Feb), Vol. 34(1), 1-18.—Evaluates alcoholism in terms of a systems theory of the self. It is stated: "(1) the metapsychology must come out of cybernetics and systems theory, involving a new understanding of mind and human relationship, and power, (2) that the alcoholic is operating, when sober, in terms of an epistemology which is conventional to the development of the self, but which is not acceptable to systems theory, (3) that surrender to alcoholic intoxication provides a partial and subjective short cut to a more correct state of mind, and (4) that the theology of Alcoholics Anonymous coincides closely with an epistemology of cybernetics." Discusses limitations and implications of the theory. F. M. Upchurch.

9302. Devine, Diane K. (Cambridge State Hosp., O.) **A preliminary investigation of paintings by alcoholic men.** *Canadian Journal of Art Therapy*, 1970(Apr), Vol. 9(3), 115-122.—Reports the results of a study of 10 paintings painted by 80 male alcoholic patients. The paintings were selected to test the hypothesis that the art of alcoholics is characterized by a style. The study was a pilot study and found that the artistic style of the work tended to be rigid and similar. Results are discussed in terms of needed refinements in methodology and the need to develop descriptive rating scales. Also the need for several kinds of control groups is noted.—H. J. M. Wessing.

9303. Hallen, O., Neundörfer, B., & von Rad, M. (U. Heidelberg, Neurological Clinic, W. Germany) **Neurologische Erkrankungen bei chronischem Alkoholismus.** [Neurological illness in chronic alcoholism.] *Neurologie*, 1971(Feb), Vol. 42(2), 57-65.—Describes a variety of neurological symptoms observable in alcoholic patients including seizures, delirium tremens, EMG disorders, nystagmus, locomotor ataxias, and metabolic changes affecting nervous system functioning. A discussion of various therapies is included as well as a considerable review of the literature. (92 ref.)—E. R. Wist.

9304. Kish, George B. (Veterans Administration Hosp., Ft. Meade, S.D.) **Cognitive innovation and stimulus-seeking: A study of the correlates of the Obscure Figures Test.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 95-101.—Conducted a series of 4 studies examining a variety of correlates of the Obscure Figures Test (OFT). Using 102 male hospitalized alcoholics as Ss, the OFT was found to be positively related to education, intelligence, numerical aptitude, manual and finger dexterity, sensation-seeking, scientific and computational interests, and to the K. Ma. and Es scales of the MMPI. Negative relationships were found with Social Introversion and Welsh's R scale of the MMPI. Results are felt to support an analysis of "cognitive innovation" in terms of capacity to innovate and interest in simulational variety.—*Journal abstract.*

Suicide

9305. Frederick, Calvin J. & Resnik, H. L. (National Inst. of Mental Health, Chevy Chase, Md.) **How suicidal behaviors are learned.** *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 37-55.—Different forms of suicidal behavior are subjected to stimulus-response analysis as well as contrasting viewpoints

Behavior therapies are described and illustrated, and the point is strongly made that suicide behavior is not a unitary disorder. (44 ref.)—*W. Vernon.*

9306. Glaser, Kurt. (U. Maryland, Medical School, Baltimore) **Suicidal children—management.** *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 27-36.—The child's comprehension of death is that of a reversible event. Thus, the threat of suicide implies that the child can live on and enjoy the parents' changed attitude. Serious suicidal threats by children are often provoked by seemingly trivial causes, but they must be appreciated as significant for the child at his intellectual and maturational level of reasoning. While completed suicides in children are rare, suicidal statements and threats are not, and they may be indications of emotional disturbance. (15 ref.)—*W. Vernon.*

9307. Hood, Ralph W. (South Dakota State U.) **Effect of foreknowledge of sex and manner of death in the assessment from suicide notes of intent to die.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 73-80.—Investigated the differential assessment of intent to kill oneself perceived in previously written suicide notes as a function of foreknowledge of the note writer's sex and nature of death. Foreknowledge that the note writer later died from natural causes resulted in a greater assessment of intent to die than foreknowledge that the person later committed suicide. There was an interaction between foreknowledge of sex and nature of death: suicide notes previously written by females were perceived as indicating a greater intent to die if it was known that the women later died a natural death than if it was known the women later committed suicide. These results are consistent with cultural expectation concerning general differences in male-female behavior and were considered as providing support for the risk of retrospective distortion involved in the study of suicide after the fact as well as indicating that stability in suicide statistics need not imply legitimate knowledge concerning the suicidal behavior the statistics are supposed to represent. (30 ref.)—*Journal summary.*

Crime

9308. Bennett, Lawrence A. (Dept. of Corrections, Research Div., Sacramento, Calif.) **Test taking "insight" of prison inmates and subsequent parole adjustment.** *Correctional Psychologist*, 1970(Jul), Vol. 4(1), 27-34.—To provide a measure of insight into normal psychological functioning, 32 prison inmates were tested within 2 wk. of release on parole and were instructed to "fake-good" in such a way as to produce normal CPI and MMPI profiles. Cases were ranked on a "normal-abnormal" continuum and compared to parole officers' ratings of adjustment 6 mo. after release and to parole outcome at the end of 2 yr. About $\frac{1}{3}$ of the group was able to achieve relatively normal profiles. For those cases where comparison with intake testing was possible, $\frac{1}{4}$ evidenced a shift toward more normal profiles. Insight as measured in this study and normal profiles was unrelated to parole adjustment. It was noted that despite the instructions to "fake-good," most of the Ss responded in terms of their own best evaluation of themselves, suggesting that prerelease testing can be used as a reliable indicator of view-of-self which can be related to subsequent parole adjustment. (19 ref.)—*R. V. Hamilton.*

9309. Cohen, John. (U. Manchester, England) **Un-**

certainty and risk-taking in crime. *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 293-296.—Discusses and analyzes the problems of uncertainty and risk-taking in relation to crime. Cited is a twofold difficulty in the application of the theory of uncertainty and risk to the domain of crime, i.e., devising suitable experimental situations, and securing suitable control groups. Ingenuity, resourcefulness, and serious study are needed.—*V. S. Sexton.*

9310. Cunningham, Cyril. (Portsmouth Polytechnic, England) **Korean war studies in forensic psychology.** *Bulletin of the British Psychological Society*, 1970(Oct), Vol. 23(81), 309-311.—The Korean war studies are seen as of doubtful value to forensic science outside the area in which they were applied. These studies did contribute some useful material to penology, clinical psychology, and the understanding of the human thought processes. It is stated that much can be learned from the Chinese use of group dynamics, though doubtless at the risk of being accused of advocating "brainwashing." Penology can profit from the lessons these Korean studies afford concerning the control of the social structure of prisoner groups and the need for extensive segregation facilities within every prison.—*V. S. Sexton.*

9311. Kodman, Frank & Hopkins, Robert W. (Murray State U.) **Correlates of ego-strength in a sample of Kentucky prison inmates.** *Correctional Psychologist*, 1970(Jul), Vol. 4(1), 20-26.—2 samples of 30 prison inmates each were selected from 350 males on the basis of their scores on the Barron Ego-Strength scale. The high-ego-strength group was characterized by an absence of neurotic anxiety, mildly rebellious and nonconforming, socially outgoing without close personal ties, a strong emphasis on masculinity, good ego strength, a normal amount of defensiveness, and a tendency toward abstract interests; the low-ego-strength group was characterized by poor self-concept, poor ego-strength, moderate depression and pessimism, more than average number of somatic concerns, rigidity and compulsiveness, eccentricity and withdrawal, unusual personal experience, high activity level, shyness, a dissatisfaction with interpersonal relationships and a high potential for rebelliousness and nonconformity—all determined from the MMPI. The high-ego-strength group also showed a higher IQ educational level and drew more normal or healthier human figures. There should be a positive correlation between high ego strength and low degree of psychopathology and prognosis for social rehabilitation.—*R. V. Hamilton.*

9312. Kodman, Frank & Hopkins, Robert W. (Murray State U.) **MMPI profile characteristics of Kentucky prison inmates.** *Correctional Psychologist*, 1970(Jul), Vol. 4(1), 7-11.—"A nomothetic analysis of 320 Kentucky prison inmates shows a mean MMPI profile with major peaks at subscales 4 and 9 (psychopathic deviate and hypomania).... Interpretation of the mean profile shows the average inmate to be overactive irritable, shows the average inmate to be overactive irritable, talkative, and stubborn-hostile with a moderate psychopathic flavor. There is an absence of neurotic anxiety, a few somatic concerns, sensitivity to others' opinions, a dissatisfaction with interpersonal relationships and a tendency toward abstract interests."—*R. V. Hamilton.*

9313. Rice, Ronald G. (Florida) **A scale for measuring attitude changes among inmates of local jails and among correctional workers.** *Deviant Behavior Abstracts International*, 1971(May), Vol. 3(11-A), 6162

9314. White, William C. (Florida State U.) **Selective**

modeling in youthful offenders with high and low O-H (overcontrolled-hostility) personality types. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5648.

Juvenile Delinquency

9315 Breskin, Stephen & Burchill, Philip G. (New York State Psychiatric Inst., New York) **Nonverbal rigidity and severity of criminal offense in a group of juvenile delinquents.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 265-267.—Ss were 100 male juvenile delinquents (12-19 yr. of age). Each delinquent's criminal act was classified as a 1st or a 2nd offense, and as a crime against a person or a crime against property, or endangering public health and welfare. High-rigid delinquents tended to be 1st offenders and to commit crimes against people.

9316 Cartwright, Desmond S., Howard, Kenneth L., & Reuterman, Nicholas A. (U. Colorado) **Multivariate analysis of gang delinquency: III. Age and physique of gangs and clubs.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1), 75-90.—Compared 238 gang members and 82 club boys with reference to national norms for age, height, and weight. Possible relationships between these variables and 5 Behavior Factor Scores are examined. Gang boys were shorter than club boys at the subgroup as well as the aggregate level. It was also found that gangs differed among themselves on age, height, and weight. These differences are related to differences in behaviors. Furthermore, gangs differed sharply among themselves in regard to the within-gang connections between age, height, and weight and behavior. Group process effects are discussed. *Journal abstract*.

9317 Dill, Joel S. (Ball State U.) **An experimental comparison of single therapist and multiple therapist group counseling with incarcerated female delinquents.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5120.

9318 Erikson, Robert V. & Roberts, Alan H. (Youth Development Center, Pottsville, Pa.) **Some ego functions associated with delay of gratification in male delinquents.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 378-382.—Compared 2 groups of 20 institutionalized adolescent delinquent males, matched for age and IQ, on measures of (a) foresight and planning ability, (b) impulsiveness, (c) verbal delay of gratification, (d) internal vs. external control, and (e) adjustment ratings, using the nonverbal Porteus Maze Tests. The experimental group consisted of Ss who had chosen to live in a special cottage and attend public school even though this choice was made with the understanding that it would delay their release from the institution. The control group consisted of Ss from the remaining cottages. The 2 groups differed in the hypothesized direction on measures of impulsiveness, verbal delay of gratification, and internal vs. external control, but not on measures of foresight and planning ability or adjustment ratings. (17 ref.)—*Journal abstract*.

9319 Glueck, Sheldon & Glueck, Eleanor. (Harvard Law School) **Toward a typology of juvenile offenders: Implications for therapy and prevention.** New York, N.Y.: Grune & Stratton, 1970. xvi, 203 p.

9320 Grob, Harry E. & Van Doren, Eric E. (Illinois State Training School for Girls, Geneva) **Aggressive group work with teenage delinquent boys.** *Children*,

1969(May), Vol. 16(3), 103-108.—Describes a work program implemented at a private institution for delinquent boys which attempts to (a) provide a summer program, (b) reduce pressure on houseparents, (c) demonstrate group work principles to institutional staff, (d) offer constructive group experience for the boys (e) provide an opportunity to observe delinquents' behavior in a constructive setting, and (f) aid the community in clearing a blighted valley. It is concluded that the purposes were accomplished, along with beneficial side effects.—D. T. Lekarczyk.

9321 Henning, John J. & Lery, Russell H. (Illinois Youth Commission, Research & Development Component, Chicago) **Personality characteristics of white and Negro adolescent delinquents.** *Correctional Psychologist*, 1970(Jul), Vol. 4(1), 12-19.—The Jr.-Sr. High School Personality Questionnaire was administered to 100 Caucasians and 100 Negroes and the results were compared with the other delinquent racial groups and with a nondelinquent normative population. The large number of personality trait differences occurred between the Negro delinquents and the normative population; the Negro delinquents were less intellectually developed, more emotionally stable, less assertive, more serious, more sensitive, more self-sufficient, and more inclined to view themselves as in conformity to social demands. The Caucasian delinquents compared to the nondelinquent population were less intellectually developed, more sensitive, more doubting, and more likely to see themselves as not in conformity with social demands. The Caucasian delinquents demonstrated better development of intellectual resources, greater shyness, and a stronger feeling of being norm violators than the Negro delinquents. These differences of personality traits suggest that the goals and methods of rehabilitation appropriate for 1 racial group may be inappropriate for another.—R. V. Hamilton.

9322 Hook, Ernest B. & Kim, Dong-Soo. (Union U. Albany Medical Coll.) **Height and antisocial behavior in XY and XYY boys.** *Science*, 1971(Apr), Vol. 172(3980), 284-286.—The observed association of the XYY genotype with both large height in childhood and institutionalization for antisocial behavior suggests that large size per se in childhood might tend to establish personality patterns leading to eventual incarceration for delinquency. To investigate this question, the height distributions of 4 groups of XY boys (N = 291) in institutions for nonpsychotic, nonretarded juvenile offenders were compared with published standards and predicted gaussian distributions calculated from the mean and variance of the age-adjusted heights of each group. In none of these groups was there evidence for an increased number of large individuals. But 3 XYY Ss in the same institutions all had heights greater than the 90th percentile of XY boys of the same race.—*Journal abstract*.

9323 Kalkstrom, Dale W. (U. Florida) **A study of the perceptual organization of black and white delinquent and non-delinquent juvenile females.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5849.

9324 Martin Canivell, Joaquín. **Difficultades para conocer el volumen real de delincuencia juvenil.** [Difficulties in determining the real extent of juvenile delinquency.] *Revista del Instituto de la Juventud*, 1970(Dec), Vol. 32, 131-138.—Statisticians may compare different concepts, e. g., instances which are corrected by

parents along with instances settled in court. However, statistics are mistrusted because of hidden juvenile crime. Reasons for hiding these crimes are the following: (a) the very nature of such acts, (b) social reasons wherein the offense is not brought to court, (c) family reasons, and (d) by action of the organizations in charge of treatment and repression of juvenile delinquency. In Spain family reasons are particularly relevant in solving the problem of an accurate determination of juvenile delinquency, because Spanish families wish to keep an appearance of honor with little interference from strangers.—A. M. Farfaglia.

9325. O'Neil, Carle F. (Iowa Training School for Boys, Eldora) **Working with families of delinquent boys.** *Children*, 1969(Sep), Vol. 16(5), 198-202.—Describes a program of work with families of 12-18 yr. old delinquents. Analyses of attitudes of parents at the time of institutionalization of their sons are provided. The composition of staff teams (psychologist or social worker, boy's houseparent or teacher, and a representative of the home community, such as a clergyman or patrol officer) are described. Each team meets with each interested family for 2 days, conducting a total of 4 2-hr sessions. Films and tapes are made of family interactions, if the family is willing. 6 principles useful for dealing with these families are listed, as are the diagnostic and treatment goals held by the staff team. Family variables leading to delinquency are discussed.—D. T. Lekarczyk.

9326. Thelen, Mark H. & Fryrear, Jerry L. (U. Missouri) **Effect of observer and model race on the imitation of standards of self-reward.** *Developmental Psychology*, 1971(Jul), Vol. 5(1), 133-135.—Assigned 96 black and white 15-17 yr. old delinquent males to observe a black or a white model who employed liberal or stringent standards of self-reward behavior. 24 other Ss did not observe a model. Even with explicit normative information, Ss clearly imitated the self-reward standards of the model. Black and white Ss imitated the liberal white significantly more than the liberal black model, but imitated the stringent black and white models about equally. Evaluative semantic differential ratings of racial attitudes showed little relationship to the imitation of self-reward.—*Journal abstract.*

Homosexuality & Sexual Deviation

9327. Benjamin, Henry. (44 E. 67th St., New York, N.Y.) **Should surgery be performed on transsexuals?** *American Journal of Psychotherapy*, 1971(Jan), Vol. 25(1), 74-82.—Discusses various factors in the case histories of typical transsexuals which suggest for or against operative procedures. The overall presentation is essentially sympathetic to the concerns of the transsexual, but a number of specific presenting problems are offered as danger signs deserving of caution.—W. Vernon.

9328. Manosevitz, Martin. (U. Texas) **Education and MMPI Mf scores in homosexual and heterosexual males.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 395-399.—Investigated the relationship between MMPI Mf, Hsx, and education in 64 heterosexual and 49 homosexual men. Ss were obtained from a variety of sources, were generally older than college students, and averaged between 2 and 3 yr. of college education. The groups differed significantly on Mf, Hsx, and Kinsey self-ratings. MMPI scale differ-

ences were found on F, K, D, Pd, Pa, Pt, Sc, and Si. Correlations of .20 and .27 were found between education and the Mf and Hsx scores. Data indicate that Mf was a better discriminator between the homosexual and heterosexual groups than Hsx, and was less contaminated by educational bias. It is concluded that the relationship between educational level and Mf appears to be more complex than generally assumed. (23 ref.)—*Journal abstract.*

9329. Money, John & Block, David. (Johns Hopkins U., Medical School) **Speech, sexuality and the temporal lobe: An analysis of spontaneous speech of thirteen male transsexuals.** *Journal of Sex Research*, 1971(Feb), Vol. 7(1), 35-41.—Analyzed and compared spontaneous speech samples of 13 male transsexuals with those obtained from normal male and female groups and other patients. The major findings indicate that transsexuals talk more than other persons both normal and abnormal and evaluate less. The low frequency of evaluative statements was suggestive of either a poorly developed superego or great dissociative facility in changing the premise on which it operates. The possible role of the temporal lobe in the regulation of speech and sexuality was considered.—E. B. Jaffa.

9330. Talayero Uriarte, Jose A. **Aspectos teóricos de la homosexualidad y presentación de un caso.** [Theoretical aspects of homosexuality and the presentation of one case.] *Revista de la Clínica de la Conducta*, 1969(Feb), Vol. 2(4), 46-60.—Presents a revision of theory based on different concepts of homosexuality. The homosexual is considered to be an individual with a neurotic-compulsive character who has failed in the task of identifying himself with his own sex. The points of view of Sadger, Kinsey, Freud, and Adler are discussed with particular attention to female homosexuality. The clinical, psychiatric history of a 14-yr-old homosexual girl is presented, followed by commentary clarifying dynamic and organic implications of the case. (French summary)—*English summary.*

MENTAL DISORDER

9331. Adler, Peter T. (Homestead Community Mental Health Center, Munhall, Pa.) **Ethnic and socioeconomic status differences in human figure drawings.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 344-354.—Evaluated the human figures drawn by 216 psychiatric patients for differences associated with ethnic group, socioeconomic status, and sex. It was hypothesized that differences in performance, particularly differences reflecting a lower level of cognitive maturity, would be associated with the socio-cultural background variables, and that these differences might well be such as to be misinterpreted as psychopathologically deviant behavior. Results generally support the hypothesis. Socioeconomic background differences were of greater importance than ethnic group differences in determining differences in cognitive membership in determining differences were associated with maturity. Drawing size and placement were associated with ethnic group status, and drawing integration was related to ethnic and social class background as well as to sex. (23 ref.)—*Journal abstract.*

9332. Bouchariat, J., Maitre, A., & Wolf, R. (Grenoble, Hospital Center, France) **Rôle des fixations orales précoces dans la psychopathologie de l'anorexie mentale.** [Role of early oral fixations in the psychopathology of anorexia nervosa.] *Annales Médico-*

Psychologiques, 1970(Nov), Vol. 2(4), 577-582.—The authors, having found by chance that a young girl with anorexia nervosa had also shown an anorexia at 14 mo. of age, systematically searched the early histories of 10 subsequent patients with a similar problem. In 7 of the 10 cases problems with eating behavior were found in earliest infancy, more exactly within the 1st yr. of life. The dossiers of 23 other adolescent anorexics, for whom no special inquiry had been made, revealed only 2 such early cases. The value of special search, by interviews with the patient's family, is therefore evident. It was among the very dependent adolescents, overprotected by their families, that the crisis of consciousness of their evolving femininity divided most sharply between their early oral fixations and developmental urges to reach a more mature state. Along with the repression of guilty wishes linked to evolving sexuality, the patient represses at the same time all that has been experienced as pleasure, and especially the overinvested pleasure of eating. A curious paradox wherein oral fixations based on the anguish of not having enough to eat eventually determines anorexic (non-eating) behavior.—H. F. Kung.

9333 Cabildo Arellano, Hector M. **Panorama epidemiológico de los desórdenes psiquiátricos en la República Mexicana.** [Epidemiologic overview of the psychiatric disorders in the Republic of Mexico.] *Revista Mexicana de Psicología*, 1970(Nov), Vol. 4(4), 169-184. Considers a long list of deviations under the heading of psychiatric disorders. Among the deviations cited are alcoholism, drug addiction, homicide, suicide, psychosis, neurosis, mental retardation, juvenile delinquency, and criminality in general. A review of the most salient epidemiologically oriented studies conducted in Mexico since the turn of the century is presented. The author analyzes each of the studies cited and advances his own conclusions.—E. Alba.

9334 Cericos, Daniel. (Jose Penna, Municipal Hosp., Buenos Aires, Argentina) **La personalidad psicopática como enfermedad mental crónica.** [Psychopathic personality as a chronic mental illness.] *Revista de Psiquiatría y Psicología Médica*, 1970(Apr), Vol. 9(6), 383-389. Discusses and criticizes K. Schneider's theoretical concepts concerning psychopathic personality. It is suggested that the concept should be used only as a result of the application of the clinical method and of the study of the individual's social behavior. A distinction should be made between psychopathic personalities that are merely abnormal and those that are clearly pathological. Both types are defined as those abnormal personalities that are characterized by a typical and structured syndrome of psychological traits that develop chronically and translate themselves into a series of habitual abnormal behaviors. The qualitative difference between the 2 types is stressed. The genuine psychopathic personality is a chronic mental illness, characterized by stereotyped rigidity and irreversibility of traits and behaviors. These behaviors are not under the psychopath's voluntary and conscious control. This makes for his more or less permanent inability to integrate himself stably into any type of social group, especially any work group.—L. Zusne.

9335 Cooke, Gerald & Robey, Ames. (Wayne State U.) **The MMPI: A case study in dissimulation.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 355-359. Presents a case study in which a 45-yr-old male patient referred by the criminal court received 4 MMPIs over a period of 10 mo. and attempted to present

himself as mentally healthy though suffering from a mental disorder. This positive malingering is examined in terms of (a) the findings of previous studies on malingering, (b) the patient's clinically observed dynamics, and (c) the difference between external instructions to dissimulate and internal motivation to do so.—Journal abstract.

9336 de Boucaud, D., Bourgeois, M., & Favard-Garrigues, B. (Abadie Center, Bordeaux, France, Le délire d'espionnage, maladie professionnelle? [The delusion of espionage, professional illness?] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 767-770. Presents a case of spying delusions found among the employees of agencies closely connected with national defense matters (atomic explosives, etc.) who are realistically subject to special security measures and policies of secrecy. The biography of each patient supplements the usual clinical history in an effort to discover whether this symptom clustering is a mere coincidence or the result of a work role which provides a pathogenic atmosphere likely to influence fragile personalities. Constant surveillance and specific questioning about their activities or attitudes became easily commingled with the confused thinking of these patients and provided a ready-made explanation for their emotional disturbances. It seems likely also that a certain predisposition was present that influenced the choice of occupation or at least of employer. The need to screen the prospective employees of security-sensitive agencies for psychopathological tendencies is emphasized.—H. E. King.

9337 Draguns, Juris G., et al. (Pennsylvania State U.) **Symptomatology of hospitalized psychiatric patients in Japan and in the United States: A study of cultural differences.** *Journal of Nervous & Mental Disease*, 1971(Jan), Vol. 152(1), 3-16. Compared symptomatology of American and Japanese psychiatric patients who were matched for age, education, occupational level, marital status, and diagnosis. Symptom expression was examined in terms of sphere (thought, affect, somatization, and action) and orientation (turning against self, against others, avoidance of others). Symptoms of Americans were more numerous, complex, and specific than those of Japanese patients, who have more diffuse symptoms. Other differences were noted, and the data were viewed as suggesting "that a degree of continuity obtains between the adaptive and pathological features prevalent within a cultural milieu." (82 ref.)—R. Denz.

9338 Grisso, J. Thomas. (Ashland Coll.) **The action-thought dimension, social competence, and defense effectiveness.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 448.—Assigned 60 male psychiatric patients to 4 groups matched for diagnosis and length of hospitalization. The 4 groups represented thought and action symptom groupings and high and low social competence (SC). Ss' responses to the Rorschach were scored for defense demand (DD) and defense effectiveness (DE). Better DE was associated with thought symptom Ss at the high SC level than with symptom Ss at the lower SC level. Other differences were not significant. Results "suggest that greater maturity may require a thought-oriented behavior style to successfully serve adaptation, while a thought-oriented behavior style may not only be unnecessary, but perhaps detrimental to the adaptive success of individuals of less maturity."—S. Knapp.

9339 Honigfeld, Gilbert & Turner, Stuart. (Hillside

awakening. Distortions of the sensorial schema of mental patients, based on perturbations of their biologic substructure and unregulated by the function of a critical consciousness, may underlie what in a more evolved form is called dissociative thinking.—H. E. King.

9345. Myers, Jerome K., Lindenthal, Jacob J., & Pepper, Max P. (Yale U.) **Life events and psychiatric impairment.** *Journal of Nervous & Mental Disease*, 1971(Mar), Vol. 152(3), 149-157.—938 adults were Ss in this field survey to assess the relationship between psychiatric impairment and life events. Impairment was judged by the extent and severity of symptomatology. 18% of the S population was judged to be severely impaired, 47% fell into a middle range, and 35% showed low psychiatric impairment. High correlations were found between the number and severity of life crises and the extent of psychiatric impairment. (19 ref.)—R. Denis.

9346. Peel, William C. (Memphis State U.) **The effectiveness of social reinforcers and social punishers with primary psychopaths, secondary psychopaths and normals.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5633.

9347. Rosen, Ira J. (U. Iowa) **The effects of praise or blame on the discrimination performance of psychopathic and nonpsychopathic boys.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5638.

9348. Rotenberg, Mordechai & Diamond, Bernard L. (U. California, Berkeley) **The biblical conception of psychopathy: The law of the stubborn and rebellious son.** *Journal of the History of the Behavioral Sciences*, 1971(Jan), Vol. 7(1), 29-38. Descriptions derived from legal interpretations and commentaries related to the biblical concept of the "stubborn and rebellious son" and the psychiatric concept of the sociopath (e.g., Pinel's maniaque sans délire, the moral insanity of Pritchard, and the present-day category of character disorder, psychopath or antisocial personality) appear to be basically the same. As with modern law, Talmudic prescribed procedure did not exempt the stubborn son from criminal responsibility.—C. M. Franks.

9349. Shagass, Charles; Overton, Donald A., Bartolucci, Giampiero, & Straumanis, John J. (Temple U. Medical Center) **Effect of attention modification by television viewing on somatosensory evoked responses and recovery functions.** *Journal of Nervous & Mental Disease*, 1971(Jan), Vol. 152(1), 53-62.—Recovery functions of somatosensory evoked responses have consistently provided measures discriminating between psychiatric patients and nonpatients. An attempt was made to obtain data bearing on the possibility that patient-nonpatient differences may be attributable to group differences in state of attention. Somatosensory recovery functions involving 5 interstimulus intervals, were measured under rest and TV conditions in 18 Ss. The integrated amplitude of the concurrent EEG was also measured. Results indicate that although EEG amplitude was significantly reduced during TV viewing, there were no consistent changes in evoked response or recovery function measurements. Also, evoked response variations were not correlated with changes in EEG amplitude. The findings make it less probable that previously found patient-control differences in somatosensory recovery functions resulted from differences in general state of attentiveness. (18 ref.)—Journal abstract.

9350. Steele, Richard F. (U. Southern California) **An examination of positive and negative reinforcement**

in classical and operant conditioning paradigms with the primary psychopath. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5641.

Neurosis & Emotional Disorder

9351. Diekmann, Hans. (Inst. of Ps., Berlin, W. Germany) **The favourite fairy tale of childhood.** *Journal of Analytical Psychology*, 1971, Vol. 16(1), 18-30.—The main fairy tale archetype is when fundamental neurotic patterns are established and the 1st neurotic symptoms appear. A strong connection between these fairy tale symptoms of the later neurosis, the structure of personality, and the patterns of behavior. The fairy tales were investigated in 50 patients. The fairy tales are among the earliest cultural products of the human individuals, typical images of the human condition assimilated and the structure of the psyche filled out with forms and pictures. Therefore, the fairy tale can be used as a diagnostic tool for the structure of the neurotic archetypal fixation. The main therapeutic value of bringing these material to the conscious and working them through at an early stage. (26 ref.)—Journal summary.

9352. Emrick, Chad D. (Teachers Coll., CUNY) **Treatment of conceptual and perceptual deficits in a 9-yr-old black S with emotional problems.** *Academic Therapy*, 1971(Spr), Vol. 6(1), 1-4. Stealing was seen at a university psychiatric hospital 9 times a wk. for 6 mo. Treatment, after a baseline was established, was primarily upon perceptual and conceptual deficits. Posttest data from the WISC and the TAT (p < .01) gains on Similarities and Picture Arrangement subtests and a significant (p < .05) gain on the TAT IQ. The hypothesis that gain in at least one area of functioning improved S's impulse life was supported. C. J. Walther.

9353. Enacheanu, Constantin (U. Medicine, Bucharest, Romania) **Névrose et art psychopathologique.** *Annales de psychiatrie et de psychopathologie*, 1970(Dec), Vol. 2(5), 697-714.—Drawing is a pathological analysis and clinical data. The individual, providing a useful tool for the pathological analysis and clinical data. The abnormal productions are set forth in a way close to normal logic, and it is believed that the dynamic of the neurosis must be seen in this sort of message is sent in a direct and indirect way. Spoiled drawings, compensatory drawings, and states, symbolic representations, and drawings offer interpretable cues to the patient's inner world. Illustrative drawings accompanied by a verbal description of how such drawings reveal mental processes. The work of creation is valuable in itself, and it is to try to synthesize his unconscious as a basis for ideas and cognitive symbols. The present study is to assist the psychopathological analysis of the problems and as a basis for the treatment of the patient with his psychotherapist.—H. E. King.

9354. Forrest, Morris S. (Florida State U.) **A learning approach to depression: Automatic behavior reduction via self-punitive behavior**

Praxis der Psychotherapie, 1969(Oct), Vol. 14(5), 205-208. Discusses the effects of early childhood trauma on the development of neuroses in adults. An attempt is made to delineate the role of psychoanalysis in the treatment of adult neuroses which are traceable to the traumatic experiences incurred during early psychosexual development. The origin of traumatic experiences is seen to be a disturbance in the primary familial group.—B. A. Stanton

9367. Wolpe, Joseph. (Temple U. Medical School) The behavioristic conception of neurosis: A reply to two critics. *Psychological Review*, 1971(Jul), Vol. 78(4), 341-343.—Presents answers to the criticisms of the behavioristic view of neurosis by C. G. Costello (see PA, Vol. 44, 12732) and B. Weitzman (see PA, Vol. 41, 11954). Costello's criticisms are considered to deal primarily with learning mechanisms and to stem from the erroneous belief that behaviorists regard neurosis as an instance of motor avoidance conditioning. Weitzman's arguments concern the reasons why clinicians reject behavior therapy and center on a defense of psychotherapeutic principles and an attack on analogy making from the laboratory to the clinic. It is observed that some of the criticisms arise from failure to note the centrality of autonomic responses (23 ref.) *Journal abstract*

Psychosis

9368. Abrams, Naomi & Pergament, Eugene. (Michael Reese Hosp. & Medical Center, Chicago, Ill.) Childhood psychosis combined with XYY abnormalities. *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 1-16.—Presents the clinical evaluation of a young male child with childhood psychosis combined with an XYY abnormality. The diagnostic material follows the child from 22-31 mo. of age. Also presented is a brief view of the current literature mentioning patients with XYY. Questions regarding the diagnostic and etiologic problems raised by a child with these symptoms and consideration of certain hypotheses are explored.—*Author abstract*

9369. Clodfelder, D. Leon & Craddick, Ray A. (Southern Illinois U.) Variance in size of drawing in a psychotic population. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 110.—Tests the hypothesis that the variance in size of drawings in a psychotic population would be greater than that obtained for a normal sample by comparing Draw-A-Person (DAP) test drawings from 69 male psychotics to the DAPs for R. A. Craddick's (see PA, Vol. 39:2632) sample of 86 males. Results suggest that psychotics are more varied in their degree of control as shown in the DAP than are normals, as was suggested by Craddick. Psychotics' drawings appeared to be more overcontrolled than those of Craddick's Ss who simulated psychosis. Although data seemed to support Craddick's hypothesis, it is suggested that an assessment should be made between over- and undercontrolled Ss and the size of their drawings.—P. Hertzberg

9370. Hoedemaker, Frederick S. (U. Washington, Medical School) Psychotic episodes and postpsychotic depression in young adults. *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 606-610.—While the depression that follows a psychotic episode in a late adolescent may be very painful to the patient, the therapist should view it as a good prognostic sign the patient recognizes his psychic "bankruptcy" and is

willing to do some needed therapeutic work. An intensive psychotherapeutic involvement at this critical time may prevent a later intractable psychosis. Case reports of a 19-yr-old and a 22-yr-old male are presented.—*Author abstract*

9371. Mass, J. W., Dekirmenjian, H., & Fawcett, J. (Ill. State Psychiatric Inst., Chicago) Catecholamine metabolism, depression and stress. *Nature*, 1971(Apr), Vol. 230(5292), 330-331.—Reports results of a pilot study undertaken to ascertain urinary concentrations of 3-methoxy-4-hydroxyphenylglycol (MHPG), a major metabolite of brain norepinephrine in 6 severely depressed Ss. Controls Ss were 49-62 yr. old males with no depressive symptoms, and controls were 3 physically healthy young males. Experimental Ss were infused with 3-hydroxy-norepinephrine continuously for a 48-hr period. Controls were maintained on diets free of chocolate, coffee, tea, cola, oranges, bananas, and cheese. Endogenous catecholamine metabolite assays were obtained prior to, during, and 48 hr. following infusion. Data were obtained from all Ss. Results demonstrate that prior to the infusion, MHPG concentrations were lower in depressed Ss, whereas concentrations of metanephrine, normetanephrine, and 3-methoxy-4-hydroxy mandelic acid were similar to those found in controls. During the 2nd day of infusions, all metabolite concentrations increased in the Ss. On subsequent assays, however, results demonstrate that depressed Ss formed normal amounts of MHPG. It is concluded that MHPG concentrations in depressed Ss prior to infusions are the result of enzyme cofactor capabilities and changes in the capacity to form MHPG outside of the brain. (20 ref.)—B. A. Stanton

9372. Misra, Pushpa. A case of obsession. *Samiksha*, 1969, Vol. 23(2), 49-59.—Describes the case of a 25-yr-old married female who showed definite indications of psychosis and had 2 complete breakdowns. It was interpreted that (a) the S had a strong guilt sense arising out of the conflict between her strong Oedipal and incest wishes and moral standards, (b) she had strong infantile and narcissistic attitudes, and (c) there was a lack of emotions in her free associations regarding her obsessive thoughts. During analysis an attempt was made to remove the S's strong guilt sense and anxiety to give relief to her, and to obtain more data. Her jealousy, sense of insecurity, and dissatisfaction in married life are also discussed. Some improvement was noticed in S's behavior but she discontinued the treatment.—C. Mehrotra

9373. Scharfetter, C. (U. Zürich, Psychiatric Clinic, Switzerland) On the hereditary aspects of symbiotic psychoses: A contribution towards the understanding of the schizophrenia-like psychoses. *Psychiatria Clinica*, 1970, Vol. 3(3), 145-152.—Points out similarities between schizophrenia and the symbiotic psychoses that originate in the intimate association of a primary psychotic (the inducer) with an originally sane partner (the induced) (folie à deux, induced insanity, psychosis of association). A special type of psychoreactive development becomes apparent in the genesis of these psychoses. In a genetic investigation, based on data from the literature and observations, an approximately equal high morbidity rate for schizophrenia was found in the families of the induced Ss who were nonconsanguineous with their inducers, as compared to those who were blood relations. The morbidity is within the probability level of schizophrenia found among the relatives of

schizophrenics, demonstrating that the inherited disposition is an important factor in the development of this type of mental illness. (16 ref.)—*Journal summary.*

9374. Schiffter, Roland. (Free U., Berlin, W. Germany) Zur Problematik schizophrenieähnlicher Psychosen bei Hypophysenerkrankungen. [The problematics of psychoses similar to pituitary diseases.] *Psychiatria Clinica*, 1971, Vol. 4(2), 82-99.—Presents a case history of a patient having a pituitary adenoma with acromegaly and a recurring schizophrenia-like psychosis. Conclusions were drawn following analysis of the case. Pituitary illness may be accompanied by schizophrenic paranoid-hallucinatory psychoses, while typical signs of "symptomatic psychoses" are absent. It is probable that a causal connection exists between such psychoses and endocrine disorders (in the patient studied, symptoms exacerbated in a constant 4-wk rhythm which can be interpreted as endocrine periodicity). An attempt was made to interpret endocrinologically-precipitated psychoses in light of the relationship between the endocrine system and the brain, and to fit them into the conceptual framework of K. Conrad. It is concluded that a sharp division between endogenous and exogenous psychoses cannot be justified. (47 ref.)—*English summary.*

Schizophrenia

9375. **Begelman, D. A. (Yale U.) Misnaming, metaphors, the medical model, and some muddles.** *Psychiatry, Washington, D.C.*, 1971(Feb), Vol. 34(1), 38-58.—Discusses the medical model and the "myth of mental illness" as conceptualized by Szasz, and examines it as a complex question of determination of responsibility. It is suggested that labeling a person as schizophrenic does not cause schizophrenia and asks "if a massive exchange of the labels 'misconduct' or 'problem in living' for 'mentally ill' were effected, would it matter much? Is it what you call a person that counts, or, rather, that you call him anything at all?" Also discussed is the dispute about whether biochemistry or therapy is the answer to the problem of schizophrenia, e.g., "if a particular form of therapy works, the biogeneticist may inquire into why it works, devising explanations based on organic concepts. He cannot insist that his theory of organic dysfunction implies that behavior therapy, for example, cannot work."—*E. M. Uprichard.*

9376. Cull, John. (Virginia Commonwealth U.) **Conformity behavior in schizophrenics.** *Journal of Social Psychology*, 1971 (Jun), Vol. 84 (1), 45-49.—Current literature indicates that schizophrenic Ss will exhibit less conformitive behavior than will normal Ss. In order to test this hypothesis, 32 hospitalized schizophrenic patients were individually introduced to a conformity-invoking environment similar to that used by Asch. The behavior produced was compared with the behavior of a controlled group introduced to the same situation. The hypothesis that schizophrenic Ss would exhibit less conformity behavior was strongly disproven.—*Author abstract.*

9377. Davis, William E., Dizzone, Michael F., & DeWolfe, Alan S. (Veterans Administration Hosp. Downey, Ill.) Relationships among WAIS subtest scores, patient's premorbid history, and institutionalization. *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 400-403.—Divided 40 schizophrenic patients equally among 4 groups on the

basis of premorbid history and length of time hospitalized. The WAIS IQ for poor premorbid tended to be higher than for good premorbid, but good premorbid demonstrated significantly higher motor performance (WAIS Digit Symbol and Block Design). There appeared to be a relationship between lower verbal abstractive and decision-making abilities (WAIS Comprehension and Similarities) and length of institutionalization. Results are interpreted as suggesting that, for schizophrenics at least, performance on certain types of intelligence test tasks may be lower for patients who have undergone prolonged institutionalization. (19 ref.)—*Journal abstract.*

9378. Graves, Gwen D., Kahans, D., & McGrath, Patricia. (Research Inst. of Mental Health, Parkville, Victoria, Australia) Age as a factor in group work with chronic schizophrenics. *Australian Occupational Therapy Journal*, 1970(Jul), Vol. 17(3), 8-14. Conducted an intensive 3-mo rehabilitation program aimed at the resocialization and occupational rehabilitation of 38 chronic schizophrenics and 1 manic-depressive, aged 18-65 yr. Ss were assigned to 4 groups: 2 of mixed ages, and 2 of uniform age groups above and below 39 yr. Ss were rated on the Venables scale of "activity-withdrawal" for schizophrenics and the MFS Rehabilitation Rating Scale covering general observations and responses to work and people. Assessments of progress were made after 6 wk. and 3 mo. in the program. All groups showed significant improvement on the withdrawal scale. Between group comparisons yielded no significant differences. Ss in groups composed entirely of Ss below 35 yr. of age showed more improvement than those in groups which contained older Ss. S. Snapp, Alfred R. & Norbert, Nancyann

9379. Heilbrun, Alfred B. & Norbert, Nancyann. (Emory U.) Sensitivity to maternal censure in paranoid and nonparanoid schizophrenics. *Journal of Nervous & Mental Disease*, 1971(Jan), Vol 152(1), 45-49. It was hypothesized that paranoid schizophrenics would be more sensitive to maternal censure than nonparanoid schizophrenics. Sensitivity in this instance was measured by disruption of a cognitive task accompanied by a tape recording of a mother censuring her son. Results support the original hypothesis. A developmental approach to the differential handling of aversive stimuli was suggested as a fruitful direction for future research. (15 ref.) R Denis

9380. Kelly, Freda S., Farina, Amerigo, & Mosher, Donald L. (U. Connecticut) Ability of schizophrenic women to create a favorable or unfavorable impression on an interviewer. *Journal of Consulting & Clinical Psychology*, 1971 (Jun), Vol 36(3) 404-409.

—Developed an Interpersonal Interview Situation (in part, a modification of the Minimal Social Behavior Scale devised by A. Farina, D. Arenberg, and S. Guskun) to study experimentally the ability of 56 female schizophrenic inpatients to create a favorable or an unfavorable impression on an interviewer. Instructions to create a favorable or an unfavorable impression yielded a highly significant difference between the groups ($p < .001$). Ss whose histories included more sustained interpersonal contacts tended ($p = .17$) to be more adept at creating both favorable and unfavorable impressions at will than Ss whose premorbid histories had included less interpersonal involvement. The significantly larger variance ($p < .05$) of Ss with good premorbid histories in the unlikable condition appeared to reflect differential resolutions of the conflict between gaining 1's approval

at the cost of the favorable regard of the interviewer. (15 ref.)—*Journal abstract*

9381. Kemp, David E. & Stephens, Joseph H. (Sacramento County Mental Health Services, Calif.) **Which AB scale? A comparative analysis of several versions.** *Journal of Nervous & Mental Disease*, 1971(Jan), Vol. 152(1), 23-30.—AB scales are comprised of items intended to differentiate therapists who are successful with schizophrenic patients from therapists who are not. Both the developmental history of, and the empirical evidence surrounding, the 9 different AB scales currently extant are reviewed. 3 scales—the original Whitehorn-Betz 23-item scale, the Schiffman et al., revision of the Whitehorn-Betz original scale, and the Campbell et al., version—are felt to be psychometrically and empirically superior. It is suggested that all 3 scales be used in future research until more data are available from which to determine the possible superiority of 1 of the scales.—*R. Denis*

9382. Kupfstein, Joan H. & Neale, John M. (Georgia State U.) **Size estimation in schizophrenic and nonschizophrenic subjects.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 430-435.

—Studied size estimation in 120 male acute and chronic schizophrenic and nonschizophrenic psychiatric patients. No significant group differences were found in the size estimation levels, or when the groups were subdivided on the basis of both premorbid adjustment and paranoid status. All Ss increased their size estimation levels over the 3 trial blocks. The thematic content of the stimuli produced a significant effect in the chronic schizophrenic group, with the nonthreatening scenes being overestimated relative to the threatening scenes. Some methodological problems common to size estimation studies are noted, and the growing inconsistency in the size estimation literature is hypothesized to be due to these problems. (23 ref.)—*Journal abstract*

9383. Lachenmeyer, Charles W. (Franklin Delano Roosevelt Veterans Administration Hosp., Montrose, N.Y.) **A note on two theoretical problems with the family process research on the etiology of schizophrenia.** *Journal of Genetic Psychology*, 1971(Mar), Vol. 118(1), 149-150.—There are 2, basic theoretical problems with the family process research on schizophrenia: (a) Certain terms are used as primitive terms when they do not satisfy the necessary conditions for these terms. (b) Propositions of the highest generality are mistakenly taken to be equivalent to testable theorems, and accordingly, relationships between observation-based primitive terms are too vaguely stated at the theorem level to permit complete testability.—*Author abstract*

9384. Ludwig, Arnold M., Marx, Arnold J., & Hill, Philip A. (U. Kentucky, Medical School) **Chronic schizophrenics as behavioral engineers.** *Journal of Nervous & Mental Disease*, 1971(Jan), Vol. 152(1), 31-44.—Describes an experimental program in which operant conditioning methods were used to train less regressed chronic schizophrenic patients as behavioral therapists for more regressed chronic schizophrenic patients. Both "guardian" patients and "charge" patients were found to show improvement. Although the program was successful, some limitations to the operant conditioning paradigm were noted. —*R. Denis*

9385. Petrović, Oto. **Kvalitativna i kvantitativna analiza procesa mišljenja shizofrenih bolesnika.** [A qualitative and quantitative analysis of the process of thinking in schizophrenic patients.] *Psihologija*, 1969-

1970(Oct), Vol. 3(1), 75-84.—Administered the graphic and verbal forms of a polyprofile test, used the method of the theta method, and measured and recorded the test required to solve the tasks. A scale for the evaluation of test behavior was also utilized. 50 schizophrenic patients and 50 normals selected on the basis of the equivalent pairs method, were Ss. A quantitative and qualitative analysis of the experimental material was performed. It shows that schizophrenics, in comparison with normals, are significantly less successful in solving problems which require the inductive formation of concepts and change in observation of a given phenomenon. A number of factors probably contribute to the fact that schizophrenics are less successful, i.e., partial approach to problem solving, frequent shifts to attention, probable difficulties in visual perception, difficulties in understanding and use of words, insufficient perseverance, and lack of critical thinking. (Russian summary. (44 ref.)—*English summary*

9386. Rastatter, Mary M. (U. Virginia) **Auditory testing of schizophrenics.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5693.

9387. Ricketts, James L. (U. Colorado) **A systematic approach to the identification of schizogenic family interaction.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5637-5638.

9389. Scott, R. D., Ashworth, P. L., & Casson, P. D. (Naphbury Hosp., St. Albans, England) **Violation of parental role structure and outcome in schizophrenia: A scored analysis of features in the patient-parent relationship.** *Social Science & Medicine*, 1970(Jul), Vol. 4(1), 41-64. Utilized an interpersonal perception test to define factors which distinguish schizophrenics from parental homes who become community-centered from those who become hospital-centered. Factors derived from the patient-parent relationship distinguished over 90% of the 34 cases studied. Method of analysis indicates that all parents saw themselves as "well" and expected to be seen by the patients as "well." Community-centered patients confirmed their parents' identity and expectations by seeing them as "well," whereas hospital-centered patients saw their parents as "ill." A 2nd method of analysis defined a parental role image, which was confirmed by the community-centered but not by the hospital-centered patients. (French, Spanish, & German summaries.—*Journal abstract*

9390. Sinha, T. C., et al. **Symposium on prognosis of schizophrenia.** *Samuksha*, 1969, Vol. 23(3), 81-130.—In the main paper D. N. Nandi traces the history of our knowledge about schizophrenia and its treatment. 2 of the discussants, Bhaskaran and Davis, are skeptical about Nandi's idea of using a preventive approach. L. P. Varma discusses important indicators and causes of relapse. A. K. Deb considers premature discontinuation of drugs as 1 of the frequent reasons for relapse. Several discussants comment on the importance of cooperation among family doctors. B. K. Bose draws attention to the ancient Sanskrit literature which has a rich reservoir of interesting information. H. Ghosal emphasizes the need for investigating more intensely the psychopathology of psychosis. T. C. Sinha indicates that Indian drugs and methods have their own contribution in treatment of mental patients. (55 ref.)—*C. Mehrotra*

9391. Smith, Ronald G. (U. Illinois, Urbana-Champaign) **Functions of intense stimulation in the reduction of schizophrenic performance deficit.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5642.

9392. Stabeanu, James R., Creveling, Cyrus R., & Daly, John. (U. Connecticut, Medical School, Hartford) **The "pink spot," 3,4-dimethoxyphenylethylamine, common tea, and schizophrenia.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 611-616.—Several studies of schizophrenic and normal patients suggested a plant food dietary source for urinary 3,4-dimethoxyphenylethylamine (3,4-DMPEA). The study of 3 non-schizophrenics found this urinary amine (positively identified by mass spectrometry) present during free diet plus tea ingestion and not present during controlled diet except when tea was being ingested. It is concluded that urinary 3,4-DMPEA has an exogenous plant source and that its presence is not primarily related to schizophrenia. (25 ref.)—*Journal abstract.*

9393. Taylor, Jerome. (U. Pittsburgh, Clinical Psychology Center) **The effects of reinforcement upon skin conductance levels in process and reactive schizophrenics and in normals.** *Journal of Nervous & Mental Disease*, 1971(Jan), Vol. 152(1), 50-52.—Previous research has shown that positive verbal reinforcement drives skin conductance toward a range which has been defined as optimal for learning. This study was concerned with whether process and reactive schizophrenics and normals differ in the degree to which reinforcement mediates change in skin conductance toward this range. It was found that reinforcement mediates such change for reactive schizophrenics and normals, more so than for process schizophrenics.—*Journal abstract.*

Schizophrenia Treatment

9394. Cancro, Robert. (Ed.) (U. Illinois) **Schizophrenic reactions: Critique of the concept, hospital treatment, and current research: Proceedings of the Menninger Foundation Conference on the Schizophrenic Syndrome.** New York, N.Y.: Brunner/Mazel, 1970. x, 293 p. \$10.—Contains written versions of 19 oral presentations and provides an overview of current research and treatment in the schizophrenic syndrome.

9395. Clancy, Helen. (U. Queensland, Brisbane, Australia) **A group family holiday: An innovation in the therapeutic management of the autistic child.** *The Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1970(Nov), Vol. 17(3), 149-162.—Describes 3 "family holiday workshop" projects which are thought to be unique. In each instance the participants were 11 families, each having an autistic child, a professional consultant, and voluntary helpers. It would seem from follow-up investigations that the family holiday workshop served the purpose for which it was originally designed: (a) to bring together families of autistic children in an effort to dispel the feeling of isolation and futility in coping with the problem of their bewildering handicapped child; (b) to meet those needs which cannot appropriately be handled in a clinic—such as providing a holiday for all members of the family; and (c) to make available advice and assistance about their child's needs and practical ways of management. The project is evaluated in the light of its relevance in the overall management of any handicapped child.—*Journal summary.*

9396. Davis, Jack A. (Lackland Air Force Base, San Antonio, Tex.) **Outpatient group therapy with schizophrenic patients.** *Social Casework*, 1971(Mar), Vol. 52(3), 172-178.—An open-ended group operated for 23 mo. with 16 wives of air force personnel. The majority were diagnosed as schizophrenic. Goals were to prevent rehospitalization, meet some dependency needs, and improve social functioning. Rationale for group treatment of outpatient schizophrenics is presented.—*M. W. Linn.*

9397. Weingaertner, Arthur H. (1554 Woodruff Ave., Westwood Village, Calif.) **Self-administered aversive stimulation with hallucinating hospitalized schizophrenics.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 422-429. Randomly assigned 45 hospitalized hallucinating veterans to 3 groups. Ss in the self-shock group carried a box on the belt which gave shock upon pressing a plunger, while Ss in the placebo group carried a box which gave no shock. The no-treatment group received only the pre- and post-evaluations which were given all Ss. Measures included the Brief Psychiatric Rating Scale and an abbreviated form of the Inpatient Multidimensional Psychiatric Scale. All groups showed significant decreases in hallucinating over a 2-wk period. No significant differences between groups were found. It is concluded that expectation was the primary agent of change, and conscious cognitive factors seemed central to the improvement. (20 ref.)—*Journal abstract.*

PSYCHOSOMATIC DISORDER

9398. Cain, J. & Bruere-Dawson, N. **Le vécu du psychosomatien comme paramètre du champ psychosomatique.** [The experience of the psychosomatician as parameter in the psychosomatic field.] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 785-786.—While the experimental method finds its limits in the subjectivity of the investigator, certain analysts have oversimplified the psychosomatic relationship by reducing it to an application of analytic concepts to organic disease. The true field of psychosomatics might better address itself to a study in depth of the experience of the psychosomatician faced with his patient. In this way, factors germane to both the patient and to the realities of the life situation of the patient might be placed in better perspective.—*H. E. King.*

9399. Nordland, Eva. (L. Oslo, Inst. for Educational Research, Norway) **Conflict state and abnormal EEG: A study of boys with behavior disturbances and abnormal EEG.** *Scandinavian Journal of Educational Research*, 1969, No. 4, 199-221.—Considered whether abnormal EEG expresses somatic reactions to psychological situations, e.g., too intense experiencing of conflict, stress, or trauma. 64 pupils of 2 Norwegian special schools for maladjusted boys were examined as to history of development, diseases and injuries, parents' situation, practices of upbringing, etc. Ss' attitudes and behavior were tested with tests of experience of anxiety, conflict and contentment, as well as intellectual and school performance. Their attitudes were assessed by their teachers in special school and by their schoolmates by means of various sociometric tests, e.g., the Silent Reading Ability Test, and the Consciousness of Conflict and Contented Conditions Test. Ss with normal and abnormal EEG were compared with each other. Analysis of the EEGs was made without

knowledge of the results of the psychological assessments and tests, and vice versa. Results show that boys with abnormal EEGs have backgrounds of more conflict and insecurity. Six who were abnormal EEG cases had no history of more physical impairments, e.g. convulsions, than the normal EEG cases. Boys who experience less pressure in special schools tend to change into normal EEG cases while boys who experience more pressure tend to change into abnormal EEG cases.—*Journal abstract*

9400 Zenz, H. (Justus Liebig U. Psychosomatische Klinik, Giessen, W. Germany) **Empirische Befunde über die Giessener Fassung einer Beschwerdenliste.** [Empirical findings concerning the Giessen form of a complaint list.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1971(Jan), Vol. 21(1), 8-13.—Reports results of a complaint checklist administered to 242 randomly selected patients at the Giessen psychosomatic clinic. A factor analysis of items exposed a structure containing 6 factors which are presented (means and standard deviations included). Suggestions are provided for the clinical interpretation of the profile of complaints. It is argued that a 5-step rating scale be used rather than the alternative choice (yes/no) in answering items. The 5 suggested multiple choice responses to be offered to patients are never, scarcely, rather, considerable, and severe. *English summary*

CASE HISTORY

9401 Alliez, J., Blanc, Fr., Nossy, Y., & Milfred, M. **B. Drépanocytose et troubles mentaux: A propos d'une observation de sicktémie avec brèves épisodes d'allure névrotique.** [Drépanocytémie and mental disturbances. A case history of sickle-cell anemia with brief episodes of neurotic behavior.] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 786.—Reports the case of a young Martinique woman who experienced nervous crises of neurotic form with verbal and motor excitation, on 3 occasions, each marked by an abrupt termination. Following the appearance of mental upset, an S-hemoglobin was discovered by electrophoresis, the same drepanocytosis being then also found in the father. The varied mental states encountered in sickle-cell anemia are summarized, but an exact interpretation is difficult in the absence of extensive statistics.—*H. E. King*

9402 Alliez, J., et al. **Délire de préjudice à évolution prolongée: Amyotrophie de Charcot-Marie avec corrélation non constante de troubles mentaux dans la fratrie: Présentation de malade.** [Delusion of jealousy of prolonged development. Amyotrophy of Charcot-Marie with a variable correlation of mental troubles among siblings. A patient presentation.] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 785.—A single case followed in a neurological clinic over 45 yr. presented first as a seizure problem, then as a Charcot-Marie atrophy, and more recently as a paranoid-delusional state marked enough to require internment. The father was also the victim of neuromuscular troubles. A sister was amyotrophic ending in a fatal dementia. 2 brothers were also victims of the Charcot-Marie illness; 1 being impaired and indifferent, the other normal. The only brother uninjured from the motor point of view presents a clinical picture of egocentricity and associability. It is noted that the separation of mental and neural symptomatology at times seen distributed

among members of the same family appears to be following a recessive mode.—*H. E. King*

Brazelton, T. Berry; Young, Grace G., & Bullowa, Margaret. (Harvard Medical School, Boston) **Inception and resolution of early developmental pathology: A case history.** *Journal of the American Academy of Child Psychiatry*, 1971(Jan), Vol. 10(1), 1-15.—Reports on the development of a child who appeared adequate but who had slumped rapidly toward a state of age—a trend which was reversed by changes in emotional climate. The child was studied in observation and documentation on normal language beginning at birth. Case material came from (a) the obstetrical and the mother's pregnancy, done chiefly by the hospital staff, (b) a child development team consisting of a pediatrician and a developmental psychologist, aided by an audiovisual technician, and a vocal documentation team consisting of an observer, a psychologist, and an audiovisual technician.—*H. Reiss*

9404 Dormoy, O., & Aizenberg, D. (U. Paul Sabatier Toulouse, France) **Encéphalopathie familiale avec oligophronie et indifférence congénitale à la douleur et syndrome de Laurence-Moon-Bardet-Biedl.** [Familial encephalopathy with oligophrenia, congenital indifference to pain and the syndrome of Laurence-Moon-Bardet-Biedl.] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 545-564.—Reports the case of a single patient and her immediate family, analyzed in detail and presented as an example of the complex way in which neurological, behavioral, and biochemical factors can be interwoven and interactive to produce a symptom picture. An 8-yr-old girl was hospitalized for mental backwardness, a tendency toward fractures and skin lesions, dental agenesis, insensitivity to pain, and startling automatization and autoaggression. Chemical, enzymatic, and cytological analyses were not definitive but suggest a biochemical (metabolic) error transmitted by a chromosome that is normal in appearance but defective in function. A diagnosis of congenital indifference to pain, probably dating from the 1st months of life, contains the most probable common denominator of the syndrome.—*H. E. King*

9405 Hill, T. M., & Saito, B. (U. Missouri, Medical School, St. Louis) **Digital computer-analyzed resting and sleep EEGs (sleep prints) after hemispherectomy in man.** *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 457-461.—Studied the resting and sleep EEGs of a 22-yr-old male patient with a left hemispherectomy, using digital computer pattern analysis and sleep print methods. The significantly more frequent occurrence of certain bioelectrical potentials in the operated side, and particularly the fluctuation of these differences in these potentials between the 2 sides during different phases of sleep, ruled out the hypothesis that this activity was exclusively spread from the unoperated hemisphere and suggested the existence of indigenous bioelectrical phenomena in the operated side. A greater amount of slow potentials, alpha waves, and over 40 cps superimposed fast activity was seen in the operated side, while indicating that 16-26 cps waves, K complexes, parietal humps, vertex sharp waves, and spindle activity occurred mainly in the unoperated side. The all-night sleep profiles of both hemispheres exhibited almost identical patterns, although the operated side revealed more slow wave spindle sleep. (French summary) (9 ref.) *Journal summary*

9406 Kane, Francis J. (Memorial Hosp., Chapel Hill,

either enlarged or changed without enlargement in the presence of high-status Ss whose jobs remained the same, and vice versa. Job enlargement was found generally to be of no greater influence than job change without enlargement so far as Ss' job satisfaction and tension were concerned. Low-status Ss tended to be favorably affected by job manipulation but responded unfavorably when their jobs were not manipulated. These opposing directions are attributed to a double Hawthorne effect. It is concluded that the effect of job enlargement in an organizational context involves a more complex combination of factors than has been previously considered. The utility of the S population for field studies of worker behavior is discussed. (16 ref.) *Journal abstract.*

9414. Searls, Donald J., Wilson, Lowell T., & Miskimins, R. W. (Colorado State U.) **Development of a measure of unemployment among restored psychiatric patients.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 223-225.—Examined the tenability of supplementing subjective clinical information concerning a patient's employability with more objective data for formulating specific placement procedures. Analysis revealed that 15 behavioral items differentiated placed successes, placed failures, and nonplaced patients on initial and replication studies of 87 and 129 psychiatric patients. Results indicate that the final items comprise an effective instrument for distinguishing the mentally restored individual who will experience failure in employment.—*Journal abstract.*

COUNSELING & GUIDANCE

9415. Abramovitz, Arnold & Abramovitz, Carole M. (U. Cape Town, South Africa) **Existential counseling: Values and integration.** *Counseling Psychologist*, 1971, Vol. 2(3), 44-47.—This response finds C. G. Kemp's (see PA, Vol. 46:Issue 5) article to be sound and comprehensive. It is concluded that adjustment is not the sole end of psychological counseling, hence, it must be concerned with other considerations such as values. The worlds of Eigenwelt, Mitwelt, and Umwelt are discussed and schematically presented as Binswanger's 3 modalities of being-in-the-world. In addition, Erikson's developmental schema of childhood growth has been used to establish that "existential therapy is often the treatment of choice in 'pathologies of will.'" —W. S. Sahakian.

9416. Ackland, Vergie L. (Arizona State U.) **A comparison of two group counseling models in facilitating verbal interaction among delinquent girls.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5752.

9417. Arbuckle, Dugald S. (Boston U.) **Reaction to Kemp.** *Counseling Psychologist*, 1971, Vol. 2(3), 32-36.—Presenting his reactions to C. G. Kemp's (see PA, Vol. 46:Issue 5) article, the author feels that one cannot write about the subject nor did Kemp reflect the feelings of an existential being. While the philosopher discusses existentialism, the existential counselor "lives and exists and experiences with the being." Kemp purported to offer a rational explanation of the nonrational, mystical, and "not-to-be-known" elements of existentialism; moreover, he attempted to convert existential faith into respectable scientific fact. Not only has Kemp ignored the contributions of behavioral scientists, his program for educating existential counselors has the appearance of being merely a "rehash." The type of counselor

avored by the author is one stressing "the experience of the student counselor," one including "the reflection by one 'who could experience deeply' with himself with others." —W. S. Sahakian.

9418. Beck, Carlton E. (U. Wisconsin, Milwaukee) **Existential counseling: Some observations.** *Counseling Psychologist*, 1971, Vol. 2(3), 48-50.—In evaluation of C. G. Kemp's (see PA, Vol. 46:Issue 5) article, reservations are expressed regarding the value of existential counseling. Kemp's views are compared with Herbert Spencer's. It is concluded that counseling is better than the counselor, "according to the counselor must be cognizant of his own expectations, and motives. It is possible that the existentialist counselor is the one who does not need to be involved in counseling." —W. S. Sahakian.

9419. Bost, David L. (Lamar State Coll. of Education) **Changes in altruistic orientations and their preferences of beginning counselors.** *Journal of Counseling Education & Supervision*, 1970(Win), Vol. 9(2), 121.—Discusses the possibility that the counselor can alter his behavior in some way as a result of counseling relationships. A study with 252 new counselor graduates entering their 1st professional experience, is described. Ss' altruistic-manipulative orientations were determined by the General Orientation subscale of the Altruistic Interpersonal Orientation Scale, administered at graduation and after a 1-yr interval. It was found that Ss tended to become more altruistic in their interpersonal orientations during their 1st yr. in the field. At the same time, Ss not only selected a counseling theory which was considerably more directive than they believed their teachers would support, but they became more direct in theory preference during their initial yr. of experience.—*Journal summary.*

9420. Brammer, Lawrence M. (U. Washington) **Existential views: Counseling supplement or substitute?** *Counseling Psychologist*, 1971, Vol. 2(3), 41.—Attempts to highlight C. G. Kemp's (see PA, Vol. 46:Issue 5) suggestions for existential counseling. The author also presents some contributions of his own related to "the American experience." Regarding the latter, existentialism is seen as a "breath of fresh air" for Americans who react to materialism, reductionism, rationalism, and empiricism. Kemp's article neglects current (especially American) writers on existentialism. Peculiar and vague terminology is the prime obstacle rendering existential ideas meaningful to counselors and students. Existential counseling provides personal and human dignity, meaning, purpose, and a focal point for man's subjective experience as an "important defining reality." —W. S. Sahakian.

9421. Carkhuff, Robert R., Friel, Ted, & Kratochvil, Dan. (American International Coll.) **The differential effects of sequence of training in counselor-responsive and counselor-initiated conditions.** *Journal of Counseling Education & Supervision*, 1970(Win), Vol. 9(2), 106-109.—In counterbalanced order 11 beginning trainees were trained by 2 doctoral-level trainers on 2 dimensions as follows: Group A: (a) counselor-responsive dimensions, and (b) counselor-initiated dimensions. Group B: (a) counselor-initiated dimensions, and (b) counselor-responsive dimensions. Pre-, mid-, and post-testing indicate that both programs were effective in demonstrating changes in communication and counseling of both counselor-responsive and counselor-initiated dimensions. The counselor-responsive-con-

counselor-initiated sequence effected the greatest changes in the counselor-responsive dimensions in the briefest period of time while not being significantly different from the level of functioning of the counselor-initiated-counselor-responsive group on the counselor-initiated dimensions.—*Journal abstract.*

9422. Colley, Charles S. (U. Alabama) **An examination of five major movements in counseling theory in terms of how representative theorists view the nature of man.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5118-5119.

9423. Combs, Charles. (Southern Illinois U., Edwardsville) **The treatise on "Existential counseling" by C. G. Kemp.** *Counseling Psychologist*, 1971, Vol. 2(3), 42-44.—This response to C. G. Kemp's (see PA, Vol. 46:Issue 5) article expresses pleasure with Kemp's articulation of the nature of existential counseling, noting its special value for students and the gap it fills in current material available to counselors and counselors-in-training. Stressed here are 3 basic forces in psychological and counseling theories corresponding to 3 modes of existence or of man as a being-in-the-world: (a) Umwelt, man seen as a reactive organism or as the object of former conditioning; (b) Mitwelt, man as a reactive being in depth comparable to the Freudian view of man; and (c) Eigenwelt or man viewed as a "being-in-the-process-of-becoming," i.e., the region holding the interest of the existential, phenomenological, humanistic, or self-psychologists.—*W. S. Sahakian.*

9424. Friesen, DeLoss D. (State U. New York, Rehabilitation Counseling Program, Albany) **Confidentiality and the pastoral counselor.** *Pastoral Psychology*, 1971(Jan), Vol. 22(10), 48-53. Discusses 4 levels of confidentiality: absolute, professional, non-restricted, and that which is almost absent. These levels are related to various ministries.—*O. Strunk.*

9425. Gold, Robert D. (Arizona State U.) **Alteration of the self concept and attitudes toward others using group behavior modification techniques.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5125.

9426. Jourard, Sidney M. (U. Florida) **On Kemp's article, "Existential counseling."** *Counseling Psychologist*, 1971, Vol. 2(3), 41. Expresses a favorable impression of C. G. Kemp's (see PA, Vol. 46 Issue 5) article, but has serious reservations about its extended length, its need to have been written in the first place, and since other capable authors have successfully and effectively made presentations of the same subject matter, and Kemp's injustice to American existentialist counselors and psychotherapists such as Rogers and Coombs.—*W. S. Sahakian.*

9427. Kaplan, Alex H. (Psychoanalytic Foundation, St. Louis, Mo.) **Review of "Existential counseling" by Dr. Kemp.** *Counseling Psychologist*, 1971, Vol. 2(3), 50-53.—Reviewing C. G. Kemp's (see PA, Vol. 46 Issue 5) article from a psychoanalyst's viewpoint, the need was found "for greater understanding of the self-awareness of one's existence," a principle also shared by psychoanalysts as a treatment goal. However, Kemp's contention that existential tenets are the major elements of the psychotherapeutic process is disputed. The pessimism of existentialism is denigrated, and objections to psychoanalytic concepts refuted, especially by citing views of psychoanalysts critical of existentialism. The claim is made that Kemp failed to demonstrate the clinical effectiveness of existential counseling or that "under-

standing of one's existence and the knowledge of one's self-awareness are the essential ingredients of the therapeutic process" (15 ref.)—*W. S. Sahakian.*

9428. Leveton, Miriam I. (U. Massachusetts) **Investigation of a modeling conditioning paradigm applied to a social learning program to facilitate social interaction in chronic psychiatric patients.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5132.

9431. McMulla, Risa E. (Florida State U.) **Differential effects of the manipulation of counselor attitudes and counselor suggestions on client self-experiencing.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5631.

9432. Reddy, W. Brendan. (U. Cincinnati [Counseling Service]) **Sensitivity training as an integral phase of counselor education.** *Communist Education & Supervision*, 1970(Win), Vol. 9(2), 110-115.—Conducted a 4-day T group conjointly with 5 male counselor education staff members and 6 practicum students. The Staff-Student Opinion Questionnaire was administered to all participants. At the end of the T group, significant gains were made on the Barrett-Lennard Relationship Inventory, a measure of R. Rogers' concept of a helping relationship. 3 mo later clients of the group members rated them on the same measure. A number of significant correlations were found. A group questionnaire anecdotally supported the findings.—*Journal abstract.*

9433. Sandman, Lea. (Metropolitan State Hosp., Norwalk, Calif.) **Two opposing models for a self-fulfilling prophecy.** *Counseling Psychologist*, 1971, Vol. 2(3), 82-87. Examined 2 conflicting models for a self-fulfilling prophecy, i.e., the pathologic model, the illness model, and the one emphasizing the strengths, assets, and capacity of the patient to be a "preferable client." Of the 2, the latter model preferred by the author, his findings are that some counseling psychologists should refrain from education, be positive working models, and avoid the pathological, medical disease model. The author's positive model is based on a humanistic and humanistic philosophy. Furthermore, positive "models also appear to be more conducive to the realization of operable self-fulfilling prophecies."—*W. S. Sahakian.*

9434. Schauer, John R. (U. Wisconsin) **Personal change groups and counseling.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 6177.

9435. Steinberg, Ira S. (Columbia U.) **An existential reaction to existential counseling.** *Counseling Psychologist*, 1971, Vol. 2(3), 45.—Existentialism is viewed as a "confusion and obscurantism" which have hindered the "existential counseling." More than 20 reasons for exercise in obscurantism, excessive counseling, and us "in the end with a confession." It is stressed that sufficient evidence has been adduced to substantiate the indictment.—*W. S. Sahakian.*

9436. Tyler, Leona E. (U. Oregon) **Existentialism in**

scoring mazes and coding, Phwaki Blocks for tactual identification, etc. Emergence of unconventional techniques was particularly furthered by good supervision.—*M. J. Stanford.*

9447. Rivenes, Richard S. & Cordellos, Harry C. (California State Coll., Hayward) **Kinesthetic performance by blind and sighted.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 76.—Studied the relative performance of 10 blind and 10 blindfolded-sighted Ss on a kinesthetic task involving space perception. Ss were given orientation trials, 3 pretraining trials without knowledge of results, 14 practice trials with knowledge of results, and 3 posttraining trials with knowledge of results. Results support J. H. Bottrill's findings that blind Ss do not develop a special ability to perform kinesthetic tasks.—*P. Hertzberg.*

9448. Wilson, Edouard L. (New York Assn. for the Blind, Psychology, & Counseling Services, N.Y.) **The use of psychological tests in diagnosing the vocational potential of visually handicapped persons who enter supportive and unskilled occupations.** *New Outlook for the Blind*, 1971(Mar), Vol. 65(3), 79-88.—Demonstrates on 2 examples the preferred use of individual focused programs against test-focused attention, and discusses techniques applied in diagnosing vocational potential of the visually handicapped who enter supportive and unskilled occupations. Intelligence tests, tests of spatial, mechanical, and motor abilities, cancellation tests, and personality tests are mentioned. Among these latter ones the TAT with an example of a story and its analysis, and projective drawing tests are singled out. It is concluded that "the potentialities of blind clients cannot, and should not, be predicated solely upon statistically reliable aptitude tests." The individual and his resistance to change have to be considered. Clients' stereotyped thinking about jobs available to blind people have to be modified; their irrational feelings concerning blindness and their tendency towards dependency have to be coped with.—*M. J. Stanford.*

Deafness & Hearing Disorder

9449. Baller, Warren R. & Giangreco, C. Joseph. (United States International U., San Diego, Calif.) **Correction of nocturnal enuresis in deaf children.** *Volta Review*, 1970(Dec), Vol. 72(9), 545-549.—A device was produced which shone a bright light into the face of a child at the onset of enuresis. 21 students of the Iowa School for the Deaf were treated with this device, and achieved dryness within 30 nights (with the exception of a single boy, who required 3 treatment periods). In addition, 19 other persistent enuretics in the school, not treated during the study, also achieved dryness by the time the treated patients did, suggesting a "vicarious sharing in the experience of victory" among the children at the school. There was no evidence of "undesirable side effects" of the correction procedure, but rather indications of heightened behavior development.—*W. A. Hass.*

9450. Cole, Nell. **Hear the wind blow.** *Volta Review*, 1971(Jan), Vol. 73(1), 36-41.—The author relates the problems of bringing up a hearing-impaired child who is also black and who was a frail infant. Only the persistence and the insistence for the best education possible for her son have made it possible for him to overcome the odds.—*Journal abstract.*

9451. Hill, Arlene. (Southwest School for the Deaf,

Lawndale, Calif.) **Some guidelines for sex education of the deaf child.** *Volta Review*, 1971(Feb), Vol. 73(2), 120-125.—1 step parents can take is to be familiar with stages of development of sexual feeling in children. An outline of these from infancy to age 6 is provided. Parents can also provide the child with a vocabulary for communication about sex, as well as providing early, and in a nonlanguage context, the more difficult concepts the child will need later to understand reproduction. Parents should remember that their actions in a loving home environment can serve as a constant, positive form of sex education.—*W. A. Hass.*

9452. Holbrook, Anthony & Crawford, Gladys H. (Florida State U.) **Modifications of vocal frequency and intensity in the speech of the deaf.** *Volta Review*, 1970(Nov), Vol. 72(8), 492-497.—During a 7-wk period, vocal frequency of adult deaf Ss was modified from abnormal to normal levels by means of an automatic voice controlling system and by application of reinforcement principles. Following the experiment, an evaluation of the vocal change produced during the brief training period indicated that the conditioning of this speech parameter was maintained over a 3-mo period.—*Journal abstract.*

9453. Odom, Richard D., Coon, Robert C., & Guzman, Richard D. (Vanderbilt U.) **Detection of an invariant among irrelevant dimensions of different salience value.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 203-206.—Assigned 38 11- and 12-yr-old deaf children for whom color was relatively more salient than form to tasks of invariance detection. The invariant of liquid amount was successfully detected by Ss in the condition that varied color but not in ones that varied form or color plus form.—*Journal abstract.*

9454. Siirala, U. & Gelhar, K. (Helsinki U., Otolaryngological Hosp., Finland) **Further studies on the relationship between Menière, psychosomatic constitution and stress.** *Acta Oto-Laryngologica*, 1970(Aug), Vol. 70(2), 142-147. Describes a study of 1970(Aug), Vol. 70(2), 142-147. Describes a study of patients with Menière's disease, carried out in 2 phases with 133 Ss treated from 1957-1966 and 33 Ss treated 1 yr. later. Data from the earlier series are from case records and follow-up inquiry. Results indicate that Menière patients subjected to careful psychic and somatic analysis were found to have a predisposing psychosomatic constitution which, under chronic or acute stress, led to somatic manifestations—in this particular case, in the ear. Chronic stress impaired prognosis (German summary)—*Journal abstract.*

9455. Suzuki, T. & Origuchi, K. (Shinshu U., Faculty of Medicine, Matsumoto, Japan) **Averaged evoked response audiometry (ERA) in young children during sleep.** *Acta Oto-Laryngologica*, 1969, Suppl. 252, 19-28. Compared thresholds of averaged evoked response to auditory stimulation for sleeping young children with thresholds obtained from conditioned orientation reflex (COR) audiometry. Data from 42 normally hearing children (4 mo to 4 yr) and 92 hard-of-hearing children (1.5 yr.) were available for comparison. The evoked response was recorded using tone bursts of 500, 1000, 2000, and 4000 Hz. They had a 25-msec rise and fall time and a 100-msec duration and were delivered every 5 sec. Approximately 30 responses were averaged during a test run. The test was administered in Sleep Stages 3 and 4 of the classification of W. Dement and L. Kleitman. COR audiometry was made according to the original method of T. Suzuki and Y.

Ogbe. For normal Ss the mean difference between both thresholds was 30.8 db. COR threshold more sensitive and 2% of measurements of hearing lay between 0-20 db. For slightly or moderately impaired Ss, the mean difference decreased to 6.8 db. COR threshold more sensitive. For severely impaired Ss the mean difference was only 4.3 db, showed response more sensitive. Significantly smaller difference between evoked response threshold and COR threshold was proved statistically in favor of hearing Ss than in normal Ss. (German summary) (19 ref.)—*Journal abstracts*.

9456 Vakne, Francis J. (State U. New York, Buffalo) The study of the self-concept and anxiety as it relates to the marginal status in the moderately impaired hearing population. *Dissertation Abstracts International*, 1971(Mar), Vol. 11(9-B), 764t.

9457 Vaskl, Smiljka. Neki aspekti prirode rečnika u jedne grupe dece sa oštećenim sluhom. [Some aspects of the nature of the vocabulary of a group of children with damaged hearing.] *Problemi*, 1969, 19(1-2), Vol. 3(1), 85-94. Analyzed the vocabulary structure obtained by a test of adjectives opposites among 60 hearing damaged children. The test consisted of 4 items for the adjectives white, good, great, and free it was necessary to write down their opposites. Analysis of results and a comparison of data with similar data show the following: (a) acceptance of the meaning of the adjectives tested primarily on the meaning as learned from direct personal and everyday experience, and (b) acceptance of the meaning of the words and the order of various levels of meaning was the same for both a hearing population and Ss. Differences were observed in the rate of acceptance and the range of the accepted various meanings, but not in the nature of the acceptance of acceptance. Types of errors were the same for both populations. Differences occurred in the frequency of occurrence and in the age at which they occurred, i.e., the percentage of incorrect answers in the deaf group at 13 yr. of age was 10 times larger than with Ss with normal hearing up to 10 yr. of age. Deaf children accepted better the meaning of concrete adjectives. The way of acceptance of the meaning of adjectives and their opposites ranges from the omission of answers over syntagmatic and parasyntagmatic usage through the real meaning of the opposites. All the answers found in the deaf group, unrelated to the articulation and morphological errors, were also observed in the group with good hearing. According to the cluster analysis, Ss can be sorted into 4 categories: (a) Ss giving the words their true vocabulary meaning, (b) Ss making opposites in a formal way, insufficiently differentiated in the sense of meaning, (c) Ss giving the given words too uncommon, specific meanings, and (d) Ss responding erroneously in semantics, articulation, and in the morphological and syntactical sense (Russian summary) (33 ref.)—*English summary*.

SPEECH DISORDER

9459 Halpera, Werner L., Hammond, Judith, & Cohen, Rhonda. (Rochester Mental Health Center, Children & Youth Div., N.Y.) A therapeutic approach to speech phobia: Elective mutism reexamined.

Journal of the American Academy of Child Psychiatry, 1971(Jan), Vol. 10(1), 94-107.—Discusses the manifestations of elective mutism. The mutism can be associated with (a) a predisposing hypersensitivity to instinctual drives, (b) a traumatic event experienced during the critical periods of language development, (c) an adverse environment, (d) a psychological fixation, and (e) a neurologic symptom compromise. Elective mutism is a psychological response which attempts to protect a poor self-image. The effects of behavioral modification techniques are discussed in relation to speech phobia. The speech phobic patient defines the ways he refuses to engage himself with others. Examples of this are found in the case studies of speech phobias. (34 ref.)—*H. Reiser*.

9460 Mehrhof, Edward G. & Rousey, Clyde L. (Topeka State Hosp., Children's Service, Kan.) Speech difficulties symptomatic of destructive behavior toward self or others. *Journal of Nervous & Mental Disease*, 1971(Jan), Vol. 152(1), 63-67.—This study was derived from Rousey and Moriarty's suggestion that "difficulty in articulation of certain sounds is related to specific aspects of psychological behavior." It was hypothesized that individuals manifesting destructive behavior would also demonstrate distortion of the vowel *i* and the substitution of the *w* for *r* or *i* sounds. Results support that hypothesis.—*R. Denis*.

9462 Weston, Alan J. & Rousey, Clyde L. (Office of Education, Washington, D.C.) Voice confrontation in individuals with normal and defective speech patterns. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30, 187-190.—Used 3 groups of 20 undergraduates each to study the effect of listening to one's own voice. 1 group of 10 male and 10 female Ss without speech defects heard themselves and responded by marking equivalent forms of a semantic differential inventory. The 2nd group, characterized by speech or voice defects, followed the same procedure. A 3rd group, without speech problems, marked the semantic differential inventory without hearing themselves. Analysis of covariance indicates that Ss with speech defects show a greater reaction to hearing themselves than do Ss without speech defects. Also, women with and without speech defects show a significantly greater semantic differential reaction to hearing their own voices than the controls.—*Journal abstracts*.

NEUROLOGICAL DISORDER

9463 Fainberg, S. Trudnye deti i podkhod k nim. [Difficult children and the approach to them.] *Dashkol'noe Vospitanie*, 1970(Oct), Vol. 43(10), 70-75.—Presents an argument in behalf of the "training of inhibition" in the neuropathic child, since his behavioral difficulties are due primarily to an "organic brain defect (underdevelopment of the process of cortical inhibition)." Suitably directed training in combination with drug and psychotherapeutic treatment is held gradually to (a) bring about a reinforcement of the inhibitory process in the cerebral cortex, and (b) prevent the further development of conflicts.—*J. D. London*.

9464. Farrell, Donald F., Starr, Arnold, & Freeman, John M. (Johns Hopkins U., Medical School) The effect

of body temperature on the "periodic complexes" of subacute sclerosing leucoencephalitis (SSLE). *Electroencephalography & Clinical Neurophysiology*, 1971(May), Vol. 30(5), 415-421.—Studied the effects of body temperature changes in 4 patients with documented subacute sclerosing leucoencephalitis (SSLE). Elevated temperatures were studied during spontaneous febrile illness, after administration of typhoid vaccine, or after use of a surgical heating blanket. A surgical cooling blanket was used to induce subnormal temperatures. The "periodic complex" associated with SSLE was highly responsive to alterations in body temperature. At an elevation in body temperature, the complexes progressively decreased in frequency and amplitude and were eventually abolished. A lowering of the body temperature had the opposite effect. Studies of the visual evoked response and hypothermic and gastrocnemius-soleus reflex at varying temperatures suggest that the changes in the periodic complexes were mediated by alterations in synaptic activity. (French summary) (25 ref.)—*Journal summary*.

9465. Miller, Edgar. (U. Hull, England) On the nature of the memory disorder in presenile dementia. *Neuropsychologia*, 1971(Mar), Vol. 9(1), 75-81.—Reports that clinical descriptions of presenile dementia suggest that, in addition to the general intellectual decline, the main behavioral characteristic is a memory disorder in which recently acquired information fails to reach long-term storage. It was hypothesized that this memory disorder could be due to an abnormally rapid loss of material from short-term storage and/or a difficulty in transfer between the short- and long-term storage systems. 2 experiments with a total of 26 Ss with presenile dementia and 26 matched controls used the free recall of lists of words. Results suggest that both the hypothesized factors operate to produce the overall memory disorder in demented patients. Results are discussed in terms of recent work on coding of verbal information in memory. (French & German summaries)—*Journal abstract*.

9466. Samuels, Ina; Butters, Nelson, & Goodglass, Harold. (Veterans Administration Hosp., Boston, Mass.) Visual memory deficits following cortical and limbic lesions: Effect of field of presentation. *Physiology & Behavior*, 1971(Apr), Vol. 6(4), 447-452.—Compared the visual and auditory memory deficits of 7 male patients with cortical damage in the right parietal region, 11 male with Korsakoff patients, and 9 male non-brain-alcoholic Korsakoff patients, and 9 male non-brain-damaged controls on tasks involving the retention of consonant trigrams. When the letters were presented visually, field of presentation was a critical variable: in comparison to normals, the right parietal's memory deficit was limited to letters presented in the left visual field while the Korsakoff patients evidenced a deficit in all sectors of the field. Results from the auditory task suggest that the visual data cannot be reduced to the general serial order effect but rather are related to the visual nature of the stimuli. (16 ref.)—*Journal abstract*.

9467. Scheller, Marianne. (U. Würzburg, Neuroclinie, W. Germany) Auf welcher leistungs-Störung beruht die Rechtschreib-Lesseschwäche? [On the disturbance of which capacity are reading and writing disorders based?] *Nervenarzt*, 1971(Feb), Vol. 42(2), 97-100.—Describes results of experiments with 11 patients with reading and writing disorders which support the contention that their inability to correctly repeat spoken sentences or sequences of letters or numbers is due to a

disturbance in their ability to comprehend acoustical forms—an input disorder—rather than an output disorder. Optical-spatial disorders often observed in such patients are regarded as not playing any causal role. (19 ref.)—E. R. Wist.

9468. Warrington, Elizabeth K. & Weiskrantz, L. (National Hosp., London, England) Organisational aspects of memory in amnesic patients. *Neuropsychologia*, 1971(Mar), Vol. 9(1), 67-73. Conducted 4 experiments with a total of 6 amnesic and 8 control patients with extracerebral neurological disease in which certain aspects of organizational processes were examined. No qualitative differences in performance were found to imply altered organization of either perceptual or mnemonic information in the amnesic group. The effectiveness of "cued" recall in the amnesic group was demonstrated. Results are related to an interpretation of the amnesic syndrome in terms of disinhibition. (French & German summaries)—*Journal abstract*.

Brain Damage

9469. Carter, John L. & Miller, Phillips K. (U. Houston, Clinical Education Lab.) Creative art for minimally brain-injured children. *Academic Therapy*, 1971(Spring), Vol. 6(3), 245-252. Attempted to gain subjective and objective data pertaining to the idea that group creative art activities improve motivation and perceptual-motor coordination. 8 children with a CA range from 7.2-9.9 and an IQ range from 68-108, met for 2 hr. daily for 5 wk. Treatment consisted of engaging Ss in a variety of creative tasks involving visual, tactual, and kinesthetic modes of expression, and expression and communication of feelings, thoughts, and experiences. Pre- and posttest data were obtained using the Marianne Frostig Developmental Test of Visual Perception. Posttest gains were significant for each S on each subtest. Gains are considered to indicate that creative art activities are 1 way of enhancing visual-perceptual abilities. —C. J. Walther

9470. de Obaldia, Mario & Best, Gary A. (Penny Lane, Sepulveda, Calif.) Music therapy in the treatment of brain-damaged children. *Academic Therapy*, 1971(Spring), Vol. 6(3), 263-269. 10 brain-damaged children (CAs 10-14) were involved in the treatment program. The program consisted of a group singing and rhythm activity, and S involvement with specific instruments. Pre- and posttreatment descriptions of each S are reported. Music therapy is seen as a decisive intervention technique for use with several categories of brain damage which should be given in conjunction with an academic program. —C. J. Walther

9472. Fontenot, Donald J. & Benton, Arthur L. (U. Iowa) Tactile perception of direction in relation to hemispheric locus of lesion. *Neuropsychologia*, 1971(Mar), Vol. 9(1), 83-88.—Compared the performance of 40 patients with lesions of the right or the left hemisphere on a task involving the perception of the direction of tactile stimulation applied to the palms of the hands with each other and with those of 20 patients without cerebral disease. Results confirm earlier findings of bilateral impairment in this function in a noteworthy

proportion of Ss with right hemisphere lesions. Ss with left hemisphere lesions showed significant impairment only in the right hand. Within the left hemisphere group, aphasic and nonaphasic Ss did not differ with respect to level or pattern of performance. Results support the conclusion that the right hemisphere plays a distinctively important role in mediating spatial perception in the tactile as well as in the visual and auditory modalities (French & German summaries). *Journal abstract*

9473 Gardner, Riley W. (Menninger Foundation, Topeka, Kan.) **Evolution and brain injury: The impact of deprivation on cognitive-affective structures.** *Bulletin of the Menninger Clinic*, 1971(Mar), Vol. 35(2), 113-124. Discusses maladaptive problems including failures in the cognitive-affective areas. "A refinement of Darwinian theory is employed to explain the effects of brain injury and other forms of 'true deprivation' on the formation of cognitive-affective structures in the human being."—J. Z. Elias.

9474 Goul, William R. & Brown, Marvin. (E. Waterloo, Ontario, Canada) **Effects of age and intelligence on Trail Making Test performance and validity.** *Perceptual & Motor Skills*, 1970(July), Vol. 30(1), 319-326. The literature contains evidence that age and intelligence affect Trail Making Test (TMT) performance and probably its validity as a screening device for organicity. This study systematically explored the nature of these effects. The TMT and WAIS were administered to 93 20-32 yr old brain-damaged Ss and 100 controls. Results show that (a) TMT performance decreases with age as does TMT validity; (b) TMT performance increases with intelligence; and (c) R. Reitan's cutoff point misclassifies the controls; the misclassification rate increasing markedly with age. Results clearly indicate the need for local age-corrected norms. *Journal abstract*

9475 Kaspar, Joseph C., et al. (Children's Memorial Hosp., Chicago, Ill.) **A study of the relationship between neurological evidence of brain damage in children and activity and distractibility.** *Journal of Consulting & Clinical Psychology*, 1971(Jun), Vol. 36(3), 329-337. Compared a group of 24 boys and 12 girls, 5.8 yr. of age, with neurological evidence of brain damage (selected with IQs above 75 on the Peabody Picture Vocabulary Test) to a control group (matched for sex) on a series of measures of activity and distractibility. It was found that (a) although the average IQs of both groups were within the normal range control Ss were significantly more intelligent; (b) in a structured situation, brain-damaged Ss were more active; (c) in 3 of 4 distractibility tasks more brain-injured Ss than control Ss were distractible; and (d) in the free situation, sex and damage interacted. Correlational analysis of the group indicates that a strong set of interrelationships existed between variables in the experimental group. Central to these relationships was the input modality through which the stimuli was transmitted. Data are interpreted as indicating that brain injury affects the child's capacity to control his immediate exchanges with his environment in terms of activity level and attention. (16 ref.)—*Journal abstract*

9476 Schilling, F. (U. Marburg, Clinic for Child & Adolescent Psychiatry, W. Germany) **Zur Aussagefähigkeit des Oseretsky Tests bei normalen und hirngeschädigten Kindern.** [On the informative value of the Oseretsky Tests for normal and brain damaged children.] *Acta Paedopsychiatrica*, 1970(Sep), Vol. 37(9)

100-244. The Oseretsky modification of the Bender-Gestalt Test is used to brain-damaged and healthy children. The objectivity and reliability of the test is discussed. On the basis of the analysis, the contents of the problems to 6 months of age must be rejected. Interpretations of problems are discussed. Motor components, as stated by Oseretsky, must not be demonstrated. A factor analysis of the test contents may lead to useful results. The procedure selects brain-damaged children from the so-called motor components have no separate significance. The procedure will establish a general basis of motor development. Time and material are dependent on the information furnished. (21 ref.)—*Journal abstract*

9477 Veil, C., et al. (Eliot Research Center, Paris, France) **Brain, psychologique, socio-professionnel, psychopathologique et physio-pathologique a un an de distance de l'intoxication oxycarbonee aigue.** *Psychological, socio-professional, psychopathological and physio-pathological balance sheet one year following acute carbon monoxide intoxication.* *Annales de Psychiatrie*, 1970(Oct), Vol. 23(343-348), 800-808. Victims of acute intoxication by carbon monoxide were examined 1 yr later and their records compared with a matched control group of 20 Ss. The carbon monoxide victims generally carried identifiable sequelae of a serious and varied nature; often unknown to the person or benign and in other instances seriously impairing work. These aftereffects, the most characteristic of which were attested by EEG abnormalities (few normal tracings with many anomalies present, particularly slowed or irritative anomalies) and by defects in visual retention (lower scores on the Benton Visual Retention Test), are often associated but do not appear to constitute a strictly individualized syndrome. (93 ref.)—H. E. King

9478 Wikler, Abraham; Dixon, Joan F., & Parker, Joseph B. (Center for Advanced Study in the Behavioral Sciences, Stanford, Calif.) **Brain function in problem children and controls: Psychometric, neurological, and electroencephalographic comparisons.** *American Journal of Psychiatry*, 1970(Nov), Vol. 127(5), 634-645. Psychometric, neurological, and EEG studies were made of 24 children with scholastic-behavioral problems but no classical evidence of neurological disease and of 24 matched controls. Differences between the 2 groups were significant in all 3 measures, giving evidence of brain dysfunction in the groups with scholastic-behavioral problems. 2 subgroups—hyperactive and nonhyperactive—each with characteristics suggesting a different syndrome, are described. (24 ref.)—*Journal abstract*

9479 Wyke, Maria. (National Hosp., London, England) **The effects of brain lesions on the performance of bilateral arm movements.** *Neuropsychologia*, 1971(Mar), Vol. 9(1), 33-42. Studied the effects of brain lesions on the performance of bilaterally synchronous tapping movements of manipulative skill. 40 patients with verified left- and right-sided hemisphere lesions and 20 normal persons served as Ss. Results show that left-sided cortical lesions produce significant impairment in the rapidity of repetitive movements with both arms, whereas right-sided lesions produce impairment of movement in the contralateral arm only. There was significant impairment in precision arm

movements for both arms in the presence of right- and left-sided cortical lesions. Unilateral and bilateral tapping movements, performed by normal Ss with the 2 arms together, were significantly slower than the same movements performed by either arm alone. In the patient group there was no significant difference between the rapidity of bilateral arm movements and that of the same movements performed by the left arm alone. Results indicate that the performance of patients with cortical lesions involving intrahemispheric extensions shows comparatively less reduction in respect of the rapidity of bilateral arm movements than does that of patients without such intrahemispheric involvement. (French & German summaries) (16 ref.)—*Journal abstract*.

MENTAL RETARDATION

9480. Benevento, Joan A. (Catholic U. of America) **A comparison of auditory and visual perception in exogenous and endogenous mentally retarded adolescents.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5228-5229.

9481. Chatagnon, P. A. **Le retard de l'organisation et du développement des fonctions mentales chez l'être humain: I. Retard mental et capacité sociale.** [Retardation of the organization and development of mental functions in the human: I. Mental retardation and social capacity.] *Annales Médico-Psychologiques*, 1970(Nov), Vol. 2(4), 497-544.—The degree to which mental capacity affects social capacity is subject to great variation. The extreme mental defects are easily recognized but more benign forms are difficult to differentiate from the normal and are far more numerous. Social incapacity cannot be easily expressed in terms of MA, yet the regular linkages found between low MA, yet the regular linkages found between low intelligence and the social problems of poverty, crime, illness, and delinquency underline its causal nature. The complexity of modern life has made the teaching of skills needed for self-sufficiency that much more difficult and has increased the challenge posed by mental defect for society. Much attention has been directed to early detection and special education, within the last 20 yr., as it is now recognized that most of the problem is biological or social, rather than pathological in nature. This study presents a modest sample of 20 children or adolescents, chosen at random, in considerable detail with the intent to provide guidelines for the handling of the many from reflections arising from an intensive study of a few. Specific recommendations are offered for the management of the problem in France.—H. E. King.

9482. Cleland, Charles C., Altman, Reuben, & Swartz, Jon D. (U. Texas, Coll. of Education) **Dominance-submission in profoundly retarded male subjects under conditions of strong motivation.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 185-191.—As a function of their gross intellectual impairment and prolonged institutionalization, the profoundly mentally retarded constitute a population "doubly-shielded" from culturally determined behavior patterns. This clinical group, thus, appears uniquely appropriate for ethological investigation. This paper reports results of a simulated aggressive approach toward 26 profoundly mentally retarded adult males. The technique was demonstrated as capable of eliciting a consistent behavior repertoire from these typically unresponsive, lethargic, nonverbal

Ss. Analysis of Ss' responses provided tentative support for the ethological as opposed to the incongruity-dissonance hypothesis of motivated behavior. The significance of this procedure, as an arousal methodology without pain, and 2 unexpected findings, the evocation of speed in a "mute" S and a disproportionate degree of left-handedness are discussed. The results afford modest support for an instinctive inhibition of aggression in man—an intraspecies means of communication. (20 ref.)—*Author abstract*.

9483. Cox, Alice M. (Indiana State U.) **Le retard du développement et de l'organisation des fonctions mentales chez l'être humain: II. Les fondements familiaux du retard mental: Revue choisie de la littérature mondiale.** [Retardation of the organization and development of mental functions in the human: II. Family backgrounds of the mentally retarded: A selected review of the world literature.] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 649-695. Reviews the literature pertaining to the psychological impact of the birth of a retarded child on the immediate family. The shock, distress, and guilt felt by parents affects not only their attitudes and behavior, but inevitably influences the retardate as well by the psychological climate in which he will develop. Feelings of confusion, guilt, insecurity, denial, or protectiveness are found at all social and intellectual levels. The situation is rarely accepted immediately and is often better assimilated to family hopes and standards among the less intelligent and less educated. Overprotective attitudes develop easily out of the practical need to give special care and parental conflict over having produced such a child. Reactions of resignation and overcompensation are the most prevalent. The attitudes of siblings are important, too, and although they often follow the parental model they will be affected by the relative age and developmental stage of each. Slight retardation can be more difficult to understand and adjust to than is more obvious handicap. (114 ref.)—H. E. King.

9484. Hagen, John W. & Huntsman, Nancy J. (U. Michigan) **Selective attention in mental retardates.** *Developmental Psychology*, 1971(Jul), Vol. 8(1), 151-160. In Study I, 47 normal and 61 retarded non-institutionalized Ss at the same 4 MA levels were compared. In Study II, 21 institutionalized retarded Ss at 2 MA levels were tested. The stimuli consisted of 6 cards with a central and an incidental picture on each and 12 trials were presented. All Ss were tested on recall of both the central and incidental pictures, measures of memory span, verbal labeling ability, and IQ. In Study I, selective attention improved with MA and retardates performed as well as normals of equivalent MA. Selective attention performance was independent of memory span scores. Facility in providing verbal labels was positively related to central recall performance. In Study II, the institutionalized retardates were less able to attend selectively to the central stimuli than either the retardates or normal Ss of Study I. Findings are discussed in terms of attention deficit theory and the effects of retardation on selective attention performance.—*Journal abstract*.

9485. Jolliff, James L. (Ohio State U.) **The enhancement of self ratings by institutionalized educable mentally retarded.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5627.

9486. Kugel, Robert B. (U. Nebraska Medical School) **Combating retardation in infants with Down's syndrome.** *Children*, 1970(Sep), Vol. 17(5),

- 188-192. Reports on an 18-month pilot study of the development of 7-4-11 and children diagnosed as having Down's syndrome. To determine procedures for helping such children to achieve greater developmental progress, the experiment provided 3 programs, respectively generally lacking in an institutional setting: a home-like atmosphere, a staff of substitute mothers for each child, and continuous stimulation and physical strengthening experiences for each child. Group measurements of progress were taken. There was no control group, but the progress made by 6 of the 14 children was greater than would normally be expected of children in the condition they were in at entry. Data indicate that retarded children will develop better if provided with age-appropriate stimulation.—*D. T. Lehar, Ark.*
9487. Pustel, G., Sternlicht, M., & DeRosier, M. (Willowbrook State School, Staten Island, N.Y.) Tree drawings of institutionalized retardates: Seasonal and color effects. *Journal of Genetic Psychology*, 1971(Jun), Vol. 118(2), 217-222. Studied chromatic and achromatic tree drawings obtained from 240 institutionalized mental retardates over the 4 seasons (60 Ss for each season, dichotomized as to age, sex, and IQ), in relation to seasonal influences and the effect of annual quality of colors. Both the color effect hypothesis and seasonal influences proved to be significant, thereby lending reservations to psychodynamic interpretations of projective drawings.—*Author abstract.*
9488. Richards, B. W., Rundle, A. L., Zarembka, J., & Stewart, A. (St Lawrence's Hosp., Caterham, Surrey, England) Ring chromosome 18 in a mentally retarded boy. *Journal of Mental Deficiency Research*, 1970(Jun), Vol. 14(2), 174-186. Mental retardation, reduced head size, micrognathia, oblique palpebral fissures, and club feet were reported in a case study of a 14-yr old boy with a ring 18 chromosome. A number of other symptoms sometimes mentioned, such as congenital heart disease, congenital dislocation of the hip, dermatoglyphic anomalies, and abnormal EEG were not found. The karyotypes of both parents and both normal siblings were found to be normal. The example of a ring 18 chromosome described here is remarkable for the stability of the ring. (20 ref.)—*R. F. Hamilton.*
9489. Taguchi, K., Goodman, W. S., & Brummitt, W. M. (U. Toronto, Ontario, Canada) Evoked response audiometry in mentally retarded children. *Acta Oto-Laryngologica*, 1970(Sep), Vol. 70(3), 190-196. Recorded the auditory evoked responses of 200 1-17 yr. old mentally retarded children, using an averaging computer. As a preliminary step, several anesthetics were examined for effectiveness with these Ss. The combined use of chloral hydrate and chloromethohexital was shown to be most suitable, while sodium response was lower in older Ss, no difference in threshold was found among 3 different IQ classes. It is noteworthy that in 5-10 yr. old Ss there was a significant difference in peak latencies among 3 IQ classes, but that after 10 yr. of age the difference was not significant. In comparing Ss differences also affect peak latencies. Some of the mongoloid Ss showed huge responses (German summary) (18 ref.)—*Journal abstract.*

9491. Budoff, M. (Research Inst for Educational Psychology, U. Mass.) Learning potential: Assessing ability to reason in the educable mentally retarded. *Journal of Abnormal Psychology*, 1970(Sep), Vol. 73(2), 151-157. Educable mental retardation is largely a developmental condition having a low IQ at the start of school or following school placement. The majority of those diagnosed educable mentally retarded attain an independent social and economic adjustment. A learning potential assessment procedure was devised to avoid the circularity of IQ school performance. The experience of these children was not prepared them for the demands of the middle-class school. To minimize the negative effects of differences in past experiences, students are taught procedures related to solution of the nonverbal reasoning problems following a pretest trial. Some educable mental retardates perform design tests well prior to training (high scores) but perform poorly on the pretest but improve competence following training (gainers), and some perform poorly on the pretest and do not improve following training (non-gainers). A variety of data suggest that the 1st 2 categories perform more like CA than do the 3rd category retarded; the 3rd group, like mental retardates.—*G. Rubin-Rabson.*
9492. Jurgens, Grace. The effect of motor development lessons on trainable mentally retarded children. *Research in Education & Related Disciplines*, 1970(Jun), Vol. 5(1), 62-77. Ss were 22 trainable mentally retarded children attending special classes in a public school. Motor ability was tested with 10 items from the Lincoln-Oseretsky Motor Development Scale. The experimental group (N=11) participated in 3-4 sessions daily devoted to motor skills similar to the 10 pretest items. The means for both groups were identical prior to training—10 points out of a possible 84. After 6 wk, all Ss were retested. A 1-tailed t test was done using posttest scores. The experimental group scored significantly higher than the control group ($p < .01$). Males seemed to benefit more from motor training than did females. (17 ref.)—*C. B. Tatham.*
9493. Kershner, Keith M., & Dusewicz, Russell A. (Pennsylvania Dept. of Education, Harrisburg) K.D.K.-Oseretsky Tests of Motor Development. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 202.—Discusses the K.D.K.-Oseretsky Tests of Motor Development which were developed on a sample of 30 mentally retarded children, measuring the following areas of motor development: (a) general static coordination, (b) general dynamic coordination, (c) dynamic manual coordination, (d) simultaneous voluntary movement, and (e) speed. The tests are based on the original Oseretsky Test of Motor Development, but greatly reduce the time required for administration by employing group techniques and by specifying individual task dependencies.—*P. Hertzberg.*
9494. Sternlicht, M., Bialer, I., & Deutsch, M. R. (Willowbrook State School, Staten Island, N.Y.) Influence of external incentives on motor performance of institutionalized retardates. *Journal of Mental Deficiency Research*, 1970(Jun), Vol. 14(2), 149-154.—To investigate the effects of various externally imposed incentives on a simple manipulative task, 6 groups of Ss (15 males, 15 females in each, CA, 12-20 yr.; IQ, 50-69)

completed 2 successive trials on the Minnesota Rate of Manipulation Test under interpolated conditions of (a) no incentive, (b) praise, (c) censure, (d) aspiration, (e) praise-aspiration, and (f) censure-aspiration. Base-free estimates of S's "true" gains were used for a factorial analysis of variance. Results indicate that the condition of censure dominated other incentives even when combined with the condition of aspiration. No sex differences were determined. Implications are discussed concerning the differential value of positive or negative verbal incentives and failure as motivation with retardates.—R. V. Hamilton.

9495. Wesner, Chester E. (Temple U.) **The effects of induced arousal on paired-associate learning in mongoloids and normals.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5863.

Training & Vocational Rehabilitation

9496. Henchy, Veronica. **The use of token reinforcement as a means of improving the self-help skills of a group of trainable retarded children.** *Graduate Research in Education & Related Disciplines*, 1970(Spring), Vol. 5(2), 124-136.—The task was learning to tie a shoelace. A prosthetic training device constructed by E was used. 12 8.4-11.3 yr. old Ss were selected from special classes in a day elementary school, and were matched on the basis of IQ, age, sex, etc. 6 experimental Ss received M & M candies for each successful attempt. Training periods were 15 min. for each of 15 days. Training consisted of 3 phases: imitation, elimination of imitation and introduction of verbal instruction, and independent tying without assistance. The difference in mean number of days to reach the 2nd phase was not significant ($p > .05$). There was no difference in mean number of days to reach the last phase ($p > .05$).—C. B. Tatham.

PHYSICAL ILLNESS

9497. Biéder, J., Choisel, G., & Choisel-Hodique, D. **Le cancer en milieu psychiatrique.** [Cancer in the psychiatric milieu.] *Annales Médico-Psychologiques*, 1970(Dec), Vol. 2(5), 750-758.—Summarizes the literature on the relation between cancer and mental disease and adds data on the prevalence of cancer in selected and mental patient populations. Early writers held that cancer was rare among mental patients, but detection methods were poor and the investigators often preoccupied with brain or neural cancer alone. Reported here are the results of surveys made of female psychiatric patients for signs of cancer of the breast or uterus. The frequency differs little from the base rate of the general population. Exact comparisons are difficult owing to methodological problems, e.g., the difference in morbidity and mortality rates, the relation of both diseases to age, etc. The census of specific cancer cases found among the records examined of over 3,000 women on a psychiatric service was 56, a number greater than expected for the general population. The data are not held to be firm and usable, but it is believed that the study permits a proper statement of the premorbid which must include considerations of the development of personality, an exact timetable for the development of each condition and a review of the influence of

medication and other forms of treatment applied.—H. E. King.

9498. Boots, Doloris D. (Hawaii State Hosp., Hospital Improvement Project, Honolulu) **Helping the cancer patient: The minister and the social worker.** *Pastoral Psychology*, 1971(Jan), Vol. 22(210), 35-40. Many times both the minister and social worker attempt to assist the same patients and the same families. This is a time when communication and cooperation between clergy and social service can be most beneficial. Cases are presented to illustrate cooperation between clergy and social worker, especially in the instance of cancer patients.—O. Strunk.

9499. Cassee, E. Th. (Netherlands Inst. for Preventive Medical, Leiden) **Deviant illness behaviour: Patients of mesmerists.** *Social Science & Medicine*, 1970(Jan), Vol. 3(3), 389-396.—Reports results of a survey of patients in the Netherlands who go to see nonrecognized healers. Data were based on information from patient registration cards filled out by healers who followed the magnetotherapy theories of F. A. Mesmer (1733-1815). A sample of 290 cases was analyzed. Results show that patients of nonrecognized healers (a) are more frequently women, middle-aged, and live in small communities; and (b) have afflictions which are mostly chronic and compose a limited number of diagnostic categories. On the average, treatment consists of 25 visits and is usually ended by the patient. It is suggested that nonrecognized healers (a) have a different function from recognized medical men (patients go to see them for diseases which they consider cannot be cured by scientific medicine), and (b) allow more freedom to the patient than the physician.—P. McMillan.

9500. de Luchina, Noemi E., & Cervi, Elsa. **Experiencia interdisciplinaria en niños con problemas respiratorios en un marco institucional.** [Interdisciplinary experience with children with respiratory diseases in an institution.] *Acta Psiquiátrica y Psicológica de América Latina*, 1971(Feb), Vol. 17(1), 46-50.—In a respiratory rehabilitation center, pediatric department outpatients were referred to the psychology department because of the recurrent character of their respiratory illnesses. Psychodiagnosis showed dependency, insecurities, phobic attitudes, hyperkinesis, and irritability in the children and ritualistic or obsessive and contradictory behaviors in their mothers. A program was undertaken to modify the children's and the mothers' attitude to the illnesses, as a joint effort of pediatrics, occupational therapy, and psychology.—V. A. Colotta.

9501. Fuschfeld, Robert D. (Veterans Administration Center, Wadsworth Hosp., Los Angeles, Calif.) **Analysis of electromyographic signals by measurement of wave duration.** *Electroencephalography & Clinical Neurophysiology*, 1971(Apr), Vol. 30(4), 337-344. Analyzed EMG motor unit interference patterns in 22 normal Ss and 20 Ss with muscle disease. The rate of 0 crossing and the related mean wave duration were independent of the force of muscle contraction. The 0 crossing rate was increased and the wave duration decreased in muscle diseased Ss. It is suggested that the measurement of wave duration, directly or by 0 crossing rate, is a possible diagnostic technique in the EMG examination for detecting myopathic disintegration of motor unit discharges (French summary) (16 ref.)—*Journal summary*.

9502. George, Robert W. (Larkio Coll.) **Cancer and other disorders related to certain perceptual tests.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 155

161—The rate of reversal possibly experienced in observing hysterical epilepsy and in hysterical psychosis are shown to be similar at a statistically significant level among 11 cancer patients, 11 patients with dermatological disorders, 11 dermatological patients and 19 controls with miscellaneous disorders; also between 11 matched pairs of schizophrenics with and without cancer. Results are discussed in terms of the part played by the integrative systems of the organism both in relationship to the test results and the disorders experienced.—*Journal abstract*

9503 Thomas, Lloyd J. (U. Southern California) **The effect of anxiety and frustration on muscular tension related to the temporomandibular joint syndrome.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5644-5645.

9504 Toker, Eugene (Albert Einstein Coll. of Medicine, Yeshiva U.) **Psychiatric aspects of cardiac surgery in a child.** *Journal of the American Academy of Child Psychiatry*, 1971(Jan), Vol. 10(1), 156-166.—Some cases from the literature are revealed in reference to the importance of the heart to people throughout the ages as expressed through mythology and folklore. Literature on psychiatric aspects of heart surgery is reviewed. The case of a Puerto Rican girl suffering from latent schizophrenia is discussed in relation to the child's attitude towards surgery. Psychological examinations, the description of 5 psychotherapy sessions with the child, a commentary on 9 of the child's House-Tree-Person drawings, and a discussion of the case are included. The case revealed is an example of the cooperation between heart surgeon, psychiatrist, nursing personnel, and social worker, and reveals a satisfactory outcome in helping to correct some of the child's distortions by dealing with the child directly and honestly. (17 ref.)—*H. Rutter*

9505 Vartapetov, B. A. & Demchenko, A. S. **Predstatel'naya zheleza i vozrastnye narusheniya polovol'noy deyatelnosti.** [The prostate gland and age-specific disturbances of sexual activity.] *Kiev, USSR, Zhurnal*, 1970, 220 p.—*I. D. London*

9506 Vogel, William; Braverman, Donald M., & Klaiher, Edward L. (Worcester State Hosp., Mass.) **EEG responses in regularly menstruating women and in amenorrheic women treated with ovarian hormones.** *Science*, 1971(Apr), Vol. 172(3981), 388-391.—Describes 2 studies with 20 normal 18-21 yr. old regularly menstruating women and 6-24-29 yr. old women being treated hormonally for secondary amenorrhea. Results indicate that EEG driving responses to photic stimulation varied with the menstrual cycle and with manipulations of ovarian hormones thought to control the menstrual cycle. Estrogens reduced driving responses to photic stimulation, and estrogen plus progesterone enhanced these responses. The EEG changes may reflect the effects of gonadal steroid hormones upon central adrenergic processes. (19 ref.)—*Journal abstract*

9507 Weiss, Barry W. (State U. New York Buffalo) **Obesity, race and the process-reactive model.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5646-5647.

9508 Wright, Edwin T., Kyle, N. L., & Gunter, Ralph. **Personality test configurations in acne vulgaris.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 191-201.—52 18-22 yr. old college girls were clinically divided into groups according to the severity of their acne. Ss were then given a battery of tests, of which the MMPI was found to be the most sensitive. Ss then applied a 3-step

process of self-examination once daily to their faces and the same battery of psychological tests was given subsequent to 3 and 6 mo. of treatment. It was found that MMPI scores of Ss who reached minimal fairly high level of improvement between acne and nonacne Ss, and between mild and severe acne sample groups. In the mild-acne group, the therapeutic effects of skin treatment were reflected in relevant scale score changes: severe acne Ss became more defensive and somewhat conventional in their test responses.—*Journal abstract*

9509 Wright, Edwin L., Martin, Rose, Flynn, Catherine, & Gunter, Ralph. (Veterans Administration Center, Los Angeles, Calif.) **Some psychological effects of cosmetics.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 12-14.—Described a preposition to determine the possible effects of cosmetics on self-concept in a group of 42 college girls with various degrees of facial blemishes which could not be improved by regular use of hygiene. The MMPI was given to all Ss who then received weekly instruction in the use of cosmetics by a qualified instructor. After 3-mo. use of these cosmetics, the MMPI was again applied. The Depression (D) scale and the Psychasthenia (Pt) scale were selected as sensitive indicators of self-perception, comparison of pre- and posttreatment scores indicated improvement on both scales (D scale, $p = .001$; Pt scale, $p = .02$) as a function of the cosmetic.—*Journal abstract*

COMMUNITY SERVICES

9510 Gatell, Dale C. (Childrens Hosp., Los Angeles, Calif.) **A hotline telephone service for young people in crisis.** *Children*, 1969(Sep), Vol. 16(5), 177-180.

—Discusses problems adolescents have with existing community services. A hotline service was set up at a children's hospital to serve adolescents and young adults up to age 25. The hotline deals with problems and makes referrals. Orientation and training of service workers, largely graduate students, is described. Data are given on ages of callers and most common problems. It is suggested that comprehensive walk-in centers providing community services are needed for adolescents.—*D. T. Lehmann*

9511 Grey, David F. (United States International U. San Diego, Calif.) **A study of terminators and remainders in treatment at a community mental health day center.** *Dissertation Abstracts International*, 1971(May), Vol. 31(9-B), 5622-5623.

9512 Hansell, Norris & Hart, Donald W. (Northwestern U., Medical School) **Local service growth: The Illinois Zone Plan.** *American Journal of Psychiatry*, 1971(Nov), Vol. 127(5), 686-690.—Describes an aspect of the Illinois Zone Plan, which is dependent upon and substantial increases in local, noninstitutional, and private mental health services to achieve reductions in the use of institutional care under state auspices. Apparent headway has been made using a close linkage between state granting policy, new mental health laws, and consultation with newly established county-level mental health planning authorities.—*Journal abstract*

9513 Hitchcock, Janice E. (U. California, School of Nursing, San Francisco) **Community mental health nursing: An innovative use of the nurse's evolving role.** *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 3-12.—Describes 1 process by which a nurse effectively and usefully established a role for herself in

an antipoverty program. Following a description of the agency and details of the process, implications for nursing are discussed. Many issues are raised for community mental health nursing to consider. The implication is that if they are truly to be participants in community mental health, nurses must begin to see themselves in new roles and prepare to move in new directions using untried methods.—*Journal abstract.*

9514. Krebs, Richard. (Sinai Hosp., Baltimore, Md.) **Using attendance as a means of evaluating community mental health programs.** *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 72-77.—Attendance can be used as a way of studying and evaluating a community mental health program. Examples of research or program evaluation utilizing attendance as the basic measure of success or failure are discussed as applied to determining: (a) the effectiveness of a community worker in the follow-up care of psychiatric patients; (b) the relationship between payment of fees and the motivation of therapy; and (c) the effectiveness of a program designed to move a group of patients from the outpatient department therapies (and out of their patient status) into the community.—*Journal abstract.*

9515. Leininger, Madeleine. (U. Washington. School of Nursing) **Some anthropological issues related to community mental health programs in the United States.** *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 50-61.—Presents some major anthropological issues related to community mental health programs and centers in the United States. Reasons why a truly community-centered approach has not been fully developed and implemented in many centers is discussed. The importance of understanding cultural and social forces affecting a patient's illness and the need to incorporate these data into existing mental health programs is emphasized. Information is based upon experience with several community mental health programs and should be useful to designers and evaluators of future mental health progress.—*Journal abstract.*

9516. McQueeney, David M. (U. Missouri) **A Q-study of the perceived role of Missouri regional diagnostic clinics.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5207.

9517. Sheldon, Alan. (Harvard Medical School, Boston, Mass.) **On consulting to new, changing, or innovative organizations.** *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 62-71.—Reports the experiences of a community mental health team engaged in consulting to a Job Corps camp. The characteristics of the camp are described and salient aspects of its evolution delineated, particularly the issues of growth, change, and phase. The problems of consulting with a general and particular facets touched upon. The need for critical self-examination in consultants is emphasized.—*Journal abstract.*

9518. Strunk, Peter & Renschmidt, Helmut. (U. Marburg, Clinic for Child Psychiatry, W. Germany) **Aufgaben und Struktur kinderpsychiatrischer Kliniken.** [The task and structure of psychiatric clinics for children.] *Nervenarzt*, 1971(Feb), Vol. 42(2), 74-79.—Presents a detailed description of a new psychiatric clinic for the diagnosis and treatment of children and adolescents founded at the University of Marburg. Data are presented on the sorts of patients dealt with including age, psychiatric diagnosis, and treatment duration. A description of the procedures involved in neurological,

psychiatric, and psychological diagnosis is provided. The organizational structure of the clinic and its rationale is also elaborated including provisions for research. Finally, the physical structure and layout of the clinic is thoroughly detailed. This information is considered to be particularly useful to those who are planning new clinic facilities.—*E. R. Wist.*

9519. Vosburg, Robert L. (Darmouth Coll., Medical School) **Disaster alert and the community mental health center.** *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 24-28.—Hospitals must be prepared for disasters of indeterminate magnitude in order to fulfill their community function. The protocol for organization of services should be brief, explicit, and define who is in charge of duty assignments. Psychiatrists are uniquely prepared to handle telephone calls from distraught relatives. It is shown that psychiatric staff members of the community mental health center are uniquely prepared to function in the coordinated work of a medical disaster team. *Journal abstract.*

9520. Warren, Roland L. (Brandeis U.) **Mental health planning and model cities: "Hamlet" or "Hellzapoppin."** *Community Mental Health Journal*, 1971(Mar), Vol. 7(1), 39-49. Discusses crucial issues arising from the growth of a community mental health center movement. These are particularly evident when mental health agencies confront complex, rapidly moving planning situations in the inner city. The Model Cities program provides an important challenge, and the response of mental health agencies raises questions concerning both their will and the ability to enter the mainstream of community issues. *Journal abstract.*

9521. Windt, Arnold & Fikany, Estelle. (3520 W. Oxford Ave., Denver, Colo.) **Follow-up of children not admitted to the Fort Logan Mental Health Center.** *Journal of the Fort Logan Mental Health Center*, 1970(Spring), Vol. 6(1), 23-29. Outlines the admission practices of the children's division of a mental health center. To ascertain the effectiveness of these procedures, a follow-up survey was conducted to determine the adjustment of 92 children who had not been admitted to the facility. 50 Ss had not been clinically evaluated by the staff, and 42 had been. 31 families from each group followed through with referrals to other agencies and reported 77 and 89% favorable outcomes. 13 families reported spontaneous improvement. For those 22 Ss where results were unsatisfactory, various factors were noted: (a) minimal interest on the part of the family, (b) inadequate use of correctional agencies as treatment settings, (c) service or communication gaps, and (d) family incomes too high for agency services and too low for private care. It is concluded that the large proportion of improvements among those referred to other agencies indicates the validity of the admissions program. The use of a volunteer group to follow up uncooperative families is suggested.—*S. Knapp.*

GERIATRICS

9522. Lauter, H. (U. Göttingen, Psychiatric Clinic & Polyclinic, W. Germany) **Über Spätfarmen der Alzheimerschen Krankheit und ihre Beziehung zur senilen Demenz.** [Concerning late forms of Alzheimer's disease and its relation to senile dementia.] *Psychiatria Clinica*, 1970, Vol. 3(3), 169-189. Reports 52 cases of Alzheimer's disease with onset after age 70. The morphological differentiation from senile dementia

could be made—despite the high age at onset—on the basis of severity of cortical atrophy and of the great density of the histological changes. The clinical picture was similar to that of a control group of 40 female patients with senile dementia who were under observation or undergoing inpatient treatment and the majority of whom showed focal symptoms in the form of aphasic apractic, or agnostic disturbances. However, the late Alzheimer cases were in some respects clearly different from the classical forms of that illness as they are found during adulthood and the praesensium. Particularly remarkable is the fact that the clinical localizing tendency becomes weaker with increasing age. Alzheimer's disease and senile dementia are not 2 different disease entities, but are merely special types within the framework of a phase-specific pathomorphosis to which the identical disease process in different life periods is subjected. Such a unitary nosological theory is not only in accord with the identical morphological findings, the genetic findings are also entirely in line with this concept. (54 ref.)—*English summary*

9523 Zeman, Frederic D. (Jewish Home & Hosp. for Aged, Medical Services, New York, N.Y.) **Neuropsychiatric symptoms of somatic disorders in the aged.** *Gerontologist*, 1969(Fall), Vol. 9(3, Pt. 1), 219-220. These notes serve to emphasize the intimate relationship in the aged, of neuropsychiatric symptoms and their somatic disorders. They call to the attention of the geriatric physician the necessity for careful observation of details that can be easily overlooked due to (a) stereotyped thinking, (b) haste in history taking, and (c) too little awareness of the value of roentgen and other diagnostic techniques. To be constantly emphasized is the practical importance of attention to symptomatic disorders and overdosage with drugs, even those commonly regarded as "harmless."—*J. Linnick*

EDUCATIONAL PSYCHOLOGY

9524. Boyce, Virgil M. (North Carolina State U.) **The effect of adult basic education on selected non-cognitive attributes.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5192.

9525. Curry, William L. (U. Georgia) **The effects of classroom structure on achievement and attitudes of freedom oriented and control oriented students.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5839-5840.

9532. Munroe, Robert L. & Munroe, Ruth H. (Pitzer Coll.) **Overrepresentation of first borns in East African secondary schools.** *Journal of Social Psychology*, 1971(Jun), Vol. 84(1), 151-152.—331 students from 6 highly competitive East African secondary schools were interviewed. Analysis indicated that 1st borns appeared almost twice as frequently as expected. Among females, despite general 1st-born preponderance, 2nd borns appeared even more frequently. Analysis of further birth-order data from a relatively unselective secondary school revealed no overrepresentation of 1st borns.—*Author abstract*

9533. Reekie, Elzgrace. (U. Washington) **Personality factors and biographical characteristics associated with criterion behaviors of success in professional nursing.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5212.

9534. Weintraub, Samuel; Robinson, Helen M., Smith, Helen K., & Plessas, Gus P. (Indiana U., School of Education) **Summary of investigations relating to reading, July 1, 1969 to June 30, 1970.** *Reading Research Quarterly*, 1971(Win), Vol. 6(2), 135-319.—Summarizes 341 reports of research in the field of reading published between July 1, 1969 and June 30, 1970. The studies are grouped into 6 major categories. Category 1 lists by title and author 63 summaries on specific topics. Category 2 abstracts research on teacher preparation and practice. Category 3, the sociology of reading, includes investigation in such areas as adult reading, interests and habits, content analysis, and the use of mass media by the public. Category 4, the physiology and psychology of reading, contains 19 subsections that cover such diverse topics as readability

and legibility, auditory perception, and oral reading. Category 5, the teaching of reading, is also subdivided into sections all dealing with various aspects of reading instruction. Incorporated in Category 6 are research reports on the reading of atypical learners. (French & Spanish abstracts)—*Journal abstract.*

9535. Wilhelm, Rowena. (U. Michigan, Reading Improvement Service) **Power of immediate positive feedback.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 337-338. -Relates success experiences of a 29-yr-old nonreader, i.e., one who scores below Grade 1 on standardized reading tests. The success experiences are attributed to the techniques of immediate positive feedback and the reinforcement for successive approximations, demonstrating to S that he can read.—*Journal abstract.*

abstract.
9536. Zapan, G. (U. Bucharest, Romania) **Weights of preferential events in psychology and pedagogy.** *Revue Roumaine des Sciences Sociales-Série de Psychologie*, 1970, Vol. 14(2), 109-117.—Criticizes the practice of evaluating the effects of curriculum and other educational changes by criterion measures that treat individual items as equally weighted and that assess program effectiveness by pupils' percent correct answers. Suggested remedies lie in classifying preferential events by stages and in sequence for each subject matter and in computing the weights of preferential events. Statistical techniques are presented including Zipf's law, an application of Onicescu's principle based on a multi-dimensional spatial representation of the system to be assessed, and a modification of Nocilau's law applicable to instances where the probable frequencies of occurrence of the preferential events in the developmental stages of the system are known. A computational example is given and practical applications are indicated.—C. Mayo.

9537. Goyen, Judith D. & Lyle, J. G. (Macquarie U., School of Education, North Ryde, New South Wales, Australia) **Effect of incentives upon retarded and normal readers on a visual-associate learning task.** *Journal of Experimental Child Psychology*, 1971(Apr). Vol. 11(2). 274-280.—Administered a visual-visual paired associate learning task to 28 retarded and 28 normal readers aged 6-7 yr. There were 2 treatments, incentive and nonincentive, and $\frac{1}{2}$ the Ss from each group were tested under each treatment. It was found that (a) incentives had an incremental effect upon learning, (b) incentives were equally effective for both retarded and normal readers, and (c) the performance of the 2 groups did not differ significantly. Findings are related to a previous study by J. Goyen and J. Lyle (see PA, Vol. 42:7780) which found no incentive effects. —*Journal abstract.*

9538. Goyen, Judith D. & Lyle, J. G. (Macquarie U., School of Education, North Ryde, New South Wales, Australia) **Effect of incentives and age on the visual recognition of retarded readers.** *Journal of Experimental Child Psychology*, 1971(Apr), Vol. 11(2), 266-273.—Administered a tachistoscopic form recognition task to 24 retarded and 24 normal readers. Each group was subdivided into younger and older age levels. $\frac{1}{2}$ the Ss from each group were tested under incentive and nonincentive treatments. It was found that differences between groups and ages were mainly a function of the relatively poor performance of the younger experimental Ss, supporting the developmental lag hypothesis. Incentives produced no discernible effect upon

the performance of any of the groups. Data were also analyzed for latency of response, practice effects, and reversal errors, none of which was related to reading retardation. (13 ref.) *Journal abstract*

9542. Cowell, M. D. & Entwistle, N. J. (U. Lancaster, England) The relationship between personality, study attitudes and academic performance in a technical college. *British Journal of Educational Psychology*, 1971(1 Feb). Vol. 41(1), 85-90. Tested 117 students taking Ordinary National Certificate courses using the Eysenck Personality Inventory and the Brown-Holtzman Survey of Study Habits and Attitudes (SSHA). The relationships between the subscores on these scales and examination performance at the end of the 1st or 2nd yr. of study were investigated. Stable introverts were found to have the best study attitudes, though their examination results were not significantly better than those of the extroverts. All the subscales of the SSHA were significantly related to academic performance, but they showed contrasting patterns of relationships with the personality dimensions. *Journal abstract.*

9545 Frerichs, Allen H. (Northern Illinois U.)
**Relationship of elementary school absence to psy-
chosomatic ailments.** *Journal of School Health*
1969:1 (Feb). Vol. 39(2). 92-94. Selected 2 groups of No
from a sample of 200 6th grade children from 2
of elementary schools in a Midwestern urban area of
200,000. 28 Ss formed the high absence group with at
least 3 days absence each of the 3 previous semesters. 29
Ss formed the low absence group with the best attend-
ance record for the 3 previous semesters. The mean
scores of the IQ and the Iowa Test of Educational
Development scores for the 2 groups were nearly
identical. The scale used was part of the Psychosomatic
Symptom Scale, based on a list of psychosomatic
symptoms used to test army personnel. Results indicate a
clear relationship between having 4 or more positive
symptoms and having a high absence rate scattered over
3 semesters. A composite picture of a youth having
psychosomatic symptoms would be a boy with a high

absentee rate above average (12) but below average school achievement and productivity than a below average. A fourth approach is suggested for helping these children.

9552. Keil, Wolfgang & Keil-Specht, Helke. (U. Munster Inst. of Psychology, W. Germany) Leistungsmotivation und Erziehungsstil: Eine Familienuntersuchung. [Achievement motivation and educational styles. An investigation of families.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(4), 241-256. Examined the relationship between the achievement motives, including hope for success and fear of failure, in 100 girls and 93 boys (ages 7-13) and child-rearing attitudes and parental need for achievement. Different scales adapted for Germans were used (a short form of the Parental Attitude Research Instrument, an independence and mastery scale, and Hermann's strictness-support scale). Results show that the achievement motive can be predicted for girls by the strength of need for achievement which is found for their mothers ($r = .31$). For boys the need for achievement can be predicted by a construct of 2nd-order factors: characteristics of the "socialization climate" in the family ($r = .48$). (21 ref.)—English summary.

9553. Kenchakian, Simon V. (U. Massachusetts) A comparison of responses to the original and the oppositely stated items of the Learning Atmosphere Attitude Scale. *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5130.

9554. Kline, P. & Gale, A. (U. Exeter, England) Extraversion, neuroticism and performance in a psychology examination. *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 90-94. Administered the Fysenck Personality Inventory (Form A) to 455 students taking the human development examination at

Exeter. Correlations between extraversion and neuroticism and examination performance were both for year groups as a whole and for special groups. No stable pattern of correlation emerged, thus casting doubt on the contention that the mildly neurotic introvert succeeds best at a university. There was no evidence of curvilinearity of regression suggested by some recent studies.—*Journal abstract.*

9561. Singh, R. N. & Krishna, K. P. (Gaya Coll., Magadh U., India) Some factors underlying student unrest. *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 92-95. Explored the relative importance of reasons of student unrest. The sample consisted of 300 Ss, equally represented by students, teachers, and guardians. A 20-item checklist (in Hindi) was administered to students in small groups and individually to parents and teachers with the instruction to mark the 5 most important items. Results showed that the item "improper political interference in educational institutions" was the most important factor underlying unrest. The next few in order of emphasis were: dearth of able teachers, faults in education and examination system, low morale, and unemployment. A correlational analysis showed that the perception of the various factors by the 3 groups were more or less alike.—K. C. Panda.

9562. Waterman, Alan S. & Waterman, Caroline K. (Hartwick Coll.) A longitudinal study of changes in ego identity status during the freshman year at college. *Developmental Psychology*, 1971(Jul), Vol. 5(1), 16-17. Interviewed 92 male freshman undergraduates

ates to assess (a) occupational goals and ideological beliefs, (b) preoccurring crises in these areas, and (c) degree of commitment. Ss also completed 2 scales assessing antecedent factors in changes of status associated with family ties and cultural sophistication. A positive developmental shift was observed for changes in identity status in the area of occupation, while a retrogressive shift was found with regard to ideology. In addition, the hypotheses concerning psychological differences between Ss who changed their identity status and those that did not were supported. These differences involved personality characteristics which predated any of the observed changes in status.—*Journal abstract.*

9567. Bora, K. P. (U. Gauhati, India) **A verbal group test of general mental ability in Assamese.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2).—Reports on the construction and standardization of a verbal group test of general mental ability (in Assamese) for use at the secondary schools. The test consisted of 100 items selected out of a pool of 220 items on the basis of item analysis. The 6 subtests were: Opposites, Analysis, Arithmetical Reasoning, Number Series, Verbal Reasoning, and Classification. Multiple-choice-type items were constructed for all subtests with the exception of the Number Series for which a recall format was used. Grade norms (VII and X) have been reported for boys and girls separately and for the combined group ($N = 3,235$). Reliability and validity coefficients are also reported.—K. C. Panda.

9568. Bruni, Piero. **L'indice ω^2 per la stima del potere predittivo di differenze significative.** [The ω^2 index for the estimation of the predictive power of significant differences.] *Bollettino di Psicologia Applicata*, 1968, No. 85-87, 109-124.—Employed the index to integrate 2 of the most widely used tests of significance with the possibility of quantifying the incidence of the independent variables or to estimate the degree of dependence implied in the significant result. 341 students of junior high school and of commercial school were given tests of verbal comprehension. The total score of these tests represents the data on which the ω^2 index is exemplified. The ω^2 index is used in the course of analysis of the differences between pupils of different types of schools and of different socioeconomic backgrounds. It is concluded that the ω^2 index has led to the

attribution of a measure which is not the same as the numerous significant differences. On the basis of the criteria of the individual provisions, such differences allow for a reduction in the error of expectation (2.5% being the maximum of the total variance).—A. M. Farfaglia.

9569. Chawla, Tilak R. (Selection Centre, Kolhapur, India) **Cultural factors and Kahn Intelligence Test.** *Indian Psychological Review*, 1970(Jan), Vol. 6(2), 77-79.—Examined the culture-free characteristics of the Kahn Intelligence Tests (KIT). The KIT was administered to 154 public schoolchildren in India: 82 boys and 72 girls. Analysis of data using analysis of variance showed that groups of Ss coming from different subcultures, i.e., rural vs. urban, socioeconomic levels, language groups, and sex, did not differ significantly in their IQ scores. The findings suggest that scores on the KIT are not influenced by cultural ecology. K. C. Panda.

type data are usually collected by using a rating scale. The Lancaster Wheel is an alternative instrument which appears to have certain advantages over the conventional method, particularly when a large number of semantic-type scales are involved. *Journal abstract.*

9580. Means, Robert S. & Means, Gladys H. (Oklahoma State U.) Achievement as a function of the presence of prior information concerning aptitude. *Journal of Educational Psychology*, 1971(Jun), Vol. 62(1), 185-187. Total of 2 subjects, divided into 2 sections of an achievement test, each section of 13 items. Subjects administered an aptitude test that had been used previously to help predict achievement on the course. Ss were then ordered by post-GPA and assigned to a low and high GPA group. Ss within each group were randomly assigned to 1 of 2 treatments. Ss were told that they had high aptitude for the course, the Ss were told that their test scores revealed little aptitude for the course, and the Ss were given no information regarding their aptitude. A 2 x 2 analysis of variance design was employed to analyze performance on the 1st test, the 2nd achievement test. No significant differences were found from treatment, but significant differences were found favoring the high over the low GPA Ss. A significant interaction effect showed high GPA Ss performing better with negative information, whereas low GPA Ss performed better with positive information. *Journal abstract.*

SPECIAL EDUCATION

9587. Banerjee, Bimalendu. Education of gifted and slow learning children. *Sanskrit*, 1969, Vol. 23(2), 65-72. Discusses the characteristics and problems of exceptional children, and describes the various approaches used in the educational programs for these

children. Study of unconscious is considered essential for teachers of problem children. *C. Menzies.*

9588. Barretta, Norma P. (U. Southern California) Approach teaching of educationally handicapped students in the Torrance Unified School District. *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5836.

9589. Bolton, Shirley L. (Georgia) A study of perceptual growth when using contrasted strategies in teaching art to rural deprived children. *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5836.

9590. Fine, Martin J. (U. Kansas) Considerations in educating children with cerebral dysfunction. *Journal of Learning Disabilities*, 1970(Mar), Vol. 3(3), 142. Considers the current state of educating children with cerebral dysfunction as a poorly defined and poorly understood commodity, because of the use of unvalidated procedures and the expectation of great gains. The following constructs are discussed: (a) an educational attitude stressing the tentative nature of assessment and the need for systematic explanation of behavior and consequent modification of behavior; (b) the need for more effective than an attitude of certainty; (c) the motivational-attitudinal system of the child and how he sees himself and his remedial experience needs to be understood if the teacher can better aid in the remedial process if he understands the educational complexities involved and his own values do not conflict with program objectives; and (d) there are ways of structuring the learning environment to match the child's inner psychological state that are within the capabilities of most teachers. *ref.) -Journal abstract.*

9591. Isaacs, Ann F. (National Assn. for Gifted Children, Cincinnati, O.) Are gifted children handicapped or exceptional? Some educators will call them any name if a dollar sign can be attached. *Gifted Child Quarterly*, 1970(Fal), Vol. 14(3), 153. In an attempt to attract money for programs educators have linked the concept of "giftedness" in children to a type of disability. Thereby those with exceptional talents are grouped with the retarded and handicapped as the only means of meriting special attention. The idea of giftedness must be restored to its original meaning and should be important enough in its own right to be worthy of our funding. *-S. Krappner.*

9592. Knowles, B. A. Behaviour modification and special education. *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1970(Nov), Vol. 17(3), 170-177. Presents an overview of the literature on the current status of behavior modification applications in special education. A historical statement of the roots of behavior modification is presented along with a discussion of principles, trends, and applications. Koenig's 10 uses of behavior modification in regular and special classes are outlined. It is concluded that the future will see refinements in efficiency and application in education generally. *ref.) -C. A. Newcomer.*

9593. Leve, Robert M., Graffagnino, Paul N., & Avallone, Sara A. (Inst. of Living, Children's Clinic, Hartford, Conn.) An attempt to combine clinical and educational responses: A report on the first year's experience of a therapeutic school. *Journal of the American Academy of Child Psychiatry*, 1971(Jan), Vol. 10(1), 108-123. Attention is focused on the experimental program whereby special classes of a public

school were brought into a clinic to form an experimental school, in order to discover new patterns of service to the students. Both psychological and environmental problems were confronted. In class, teachers elicited more normal behavior as well as manifested advances in learning. Since home and neighborhood environments remained the same, no new solutions to the problems of working with inner-city parents were found. Both teachers and clinicians see the need for a representative of the protective services section of the welfare department. It is concluded that an understanding of the children, and an initiation of responsibility for them, will help the most.—H. Reiter.

9594. Velasco Fernández, Rafael. (Clinic of Behavior, Mexico, D.F.) **Los trastornos psíquicos del escolar mexicano.** [Psychic disturbances in the Mexican school.] *Revista de la Clínica de la Conducta*, 1969(Feb), Vol. 2(4), 61-67. Considers that there are neither foolproof statistics nor psychiatric research which adequately describe the more common behavior problems in Mexico. A revision of L. Kanner's old classification is suggested which is based on the origin of the disturbances from (a) school environment, (b) personality makeup, and (c) biological constitution. The shortcomings of Mexican schools and teachers are described as contributing to disturbances arising from the school environment. The most frequent psychopathological manifestations of students referred to a clinic of behavior are, in order of incidence, (a) learning difficulties, (b) hyperkinesis, (c) lack of attention, (d) aggressiveness, (e) emotional instability, (f) anxiety, (g) inhibition, (h) detachment from the group, (i) inability to stand frustrations, (j) neurotic character, and (k) psychotic tendencies. The high incidence is noted of behavior disturbances, generally considered organic, and the diagnosis of minimal brain damage. The training of school psychiatrists in Mexico is considered. (French summary)—*English summary.*

Gifted

9595. Hutson, Thomas & Osen, Deborah. (California State Coll., Fullerton) **A multi-media approach to gifted in a high school group psychology-counseling seminar.** *Gifted Child Quarterly*, 1970(Fal), Vol. 14(3), 186-190. 4th-12th graders participated in a Saturday morning seminar designed to develop intellectual freedom through critical thinking along self-determined guidelines. By working within the group process and utilizing closed circuit TV the pupils were able to view themselves and were provided with more honest feedback of their own behavior. These methods were felt to increase the student's knowledge of himself and provide more open confrontation among people.—S. Krippner.

9596. Isaacs, Ann F. (National Assn. for Gifted Children, Cincinnati, O.) **Athletic prowess and giftedness: III. A former world champion archer tells how she did it.** *Gifted Child Quarterly*, 1970(Fal), Vol. 14(3), 154-158.—A review of the accomplishments of Debby Clark as a world archery champion focuses attention on the present drawbacks in determining an individual's potential by the present criteria of achievement tests and course grades. Although Debby never demonstrated any outstanding abilities in the school milieu until she began her career in nursing, she feels her persistence, positive approach to challenges, and ceaseless practice brought her to her present eminent standing.—S. Krippner.

9597. Krippner, Stanley & Blickenstaff, Ralph. (Wagner Coll.) **The development of self-concept as part of an arts workshop for the gifted.** *Gifted Child Quarterly*, 1970(Fal), Vol. 14(3), 163-166. This study was based on the premise that societal pressures toward the stereotyped role choices determined by gender hinder creative potential. 27 8.1-14.9 yr. old boys and 13 8.1-13.6 yr. old girls were tested for corresponding levels of emotional stability, visual-motor skills, neurological organization, and mental ability. Ss were then interviewed to categorize vocational interests as either "scientific" or "artistic." Only 3 out of the 27 males showed an interest in the artistic realm while only 2 out of 13 females expressed scientific preferences. Ss then participated in a workshop designed to loosen conditioned ways of perceiving the world by means of multisensory experiences and introspective tasks. Post-workshop interviews suggested that the rigidity of role definitions was weakened; a number of artistic and scientific activities ensued which demonstrated this effect.—S. Krippner.

9598. White, M. Judson. (U. South Alabama) **The case for specifically designed education for the gifted.** *Gifted Child Quarterly*, 1970(Fal), Vol. 14(3), 159-162.—Outlines a program for developing and utilizing special talents of exceptional individuals. Phase 1 is concerned with identifying the gifted. Not only should one concentrate on the giftedness magnitude quotient, which accounts for varying degrees of ability, but provisions for a talent reclamation stage should be included to salvage those who withdraw from educational programs. Phase 2 deals with educating the gifted and should offer diverse programs for different abilities. Phase 3 insures that society makes use of these creative individuals and places them in the leadership roles they merit.—S. Krippner.

Remedial Education

9599. Anderson, Robert P. (Texas Technological U.) **A neuropsychogenic perspective on remediation of learning disabilities.** *Journal of Learning Disabilities*, 1970(Mar), Vol. 3(3), 143-148. Considers a perspective on learning disabilities which takes into account both neurologic and psychogenic factors. A specific program is described to illustrate how a curriculum may be based on the neuropsychogenic model. The program provides the child with training for language-perceptual deficits and concurrent psychotherapeutic experiences to help him cope with negative, self-defeating attitudes. (20 ref.)—*Journal abstract.*

9600. Cohen, William J. **Thought organization of the learning disabled adolescent: Some implications for the classroom.** *Discreet Schools Forum*, 1969, Vol. 5(1). Focuses "on the premise that when the adolescent's defenses against academic learning are breached he continues to have severe learning disabilities that do not disappear spontaneously but must be remediated by the educator, in the classroom setting, using an expanded awareness of how adolescents think." (16 ref.)—S. Knapp.

9601. Fairchild, Miles R. (U. South Dakota) **Case studies concerning the effects of intensive, short-term remediation of psycholinguistic abilities.** *Dissertation Abstracts International*, 1971(May), Vol. 31(1-A), 5885-5886.

9602 Parlo, Anthony P., Lohr, Jeffrey M., & Serran, C. G. (U. Wisconsin, Milwaukee) Reinforcement and educationally disadvantaged boys: An exploratory study. *Journal of Experimental Psychology*, 1971(May), Vol. 62(3), 243-252. Evaluated the reinforcement value of visual reading discrimination. The task was presented to a group of 11 educationally disadvantaged boys in a noisy recreation room of an inner city boys club. Extrinsically imposed reinforcement contingencies were not employed and boys were free to not participate. A total of 1080 games were played. All Ss participated from 1-21 times, averaging 24 responses/game. The average number of responses did not diminish with repeated participation and a median of 40% of those Ss in the room during each session participated. Findings are related to typical behavior modification orientations used in special education programs. (20 ref.) *Journal abstract*

9603 Melke, Stewart & Kilpatrick, Doreen L. (U. Calgary, Alberta, Canada) Changes in perceptual, motor and reading test scores in a remedial reading group. *Canadian Psychologist*, 1971(Apr), Vol. 16(7), 253-269. Compared 2 matched groups each composed of 9 children with reading problems on a number of perceptual, motor, and reading tests. 1 group was exposed to a special remedial program, and on retest showed significant gains in reading and in perceptual and motor areas. No similar improvement was detected in the control group denied the remedial treatment. Not all perceptual tests showed a parallel improvement with reading and the implications of this finding are discussed. (French abstract) (32 ref.) *Journal abstract*

9604 Rozin, Paul, Puritsky, Susan, & Sotsky, Raina. (U. Pennsylvania) American children with reading problems can easily learn to read English represented by Chinese characters. *Science*, 1971(Mar), Vol. 171(3971), 1264-1267. Describes a study in which with 25-35 yr of tutoring, 8 2nd grade inner city schoolchildren with clear reading disability were taught to read English material written as 30 different Chinese characters. This accomplishment eliminates certain general interpretations of e.g. dyslexia as a visual-auditory memory deficit. The success of this program can be attributed to the novelty of the Chinese orthography and to the fact that Chinese characters map orthography to the level of words rather than of phonemes. It is proposed that much reading disability can be accounted for in terms of the highly abstract nature of the phoneme (the critical unit of speech in alphabetic systems) and that an intermediate unit e.g. the syllable might well be used to introduce reading. (15 ref.) *Journal abstract*

Sensory & Physical Handicaps

9605 Bell, Janice W. (Mystic Oral School, Conn.) Visual language. *Volta Review*, 1971(Mar), Vol. 73(3), 157-160. Each student in a class for the deaf and hard-of-hearing was assigned a word as a subject for a picture montage. Using the word as a theme, S cut out and assembled pictures from magazines pertaining to and describing that word. Producing such montages can serve as a means of helping the child conceptualize the language he needs to express his ideas, and of conveying an experience of the richness of language. Examples of student montages are given. —W. A. Hass

9609 Katsikis, Bill. (State University Col. New York, Binghamton) Intellectual functioning of deaf children. *Perceptual & Motor Skills*, 1970(Feb), Vol. 30, 49-53. A multiple regression equation [$Y = 9.4 + .03(X_1) + .03(X_2) + .03(X_3)$] was developed, where Y is the mean IQ of deaf 1st-6th grade children from E.P. Torrance's Thinking Creatively With Pictures Form A, and X_1 , X_2 , and X_3 are the variables of creativity, originality, and elaboration as measured by the variables of the Leiter International Performance Scale score as the criterion variable. —Journal abstract

9610 Kurzbaul, Ina W. (Utah School for the Blind, Ogden) Personality adjustment for the blind child in the classroom. *New Outlook for the Blind*, 1970(May), Vol. 54(5), 129-134. Teachers working with handicapped children have a greater responsibility to help them become integrated individuals than those having pupils with no impairment because the process for attaining the personality is more difficult. Blind children are deprived of a range and variety of experiences, mastery, and control of environment and of self related to it to which is added a poor self-image and anxiety of the environment that easily arouses fear and anxiety. An educational program favorable for personality development and social integration of blind children has to stress teacher qualities, particularly their motivation, understanding and devotion, the emotional and physical setting and specific teaching techniques such as abundance of individual attention, teacher-pupil planning, paper-oriented assignments, and proper use of evaluation. —M. J. Sanford

9612 Levine, Edna S. (New York U.) Mental assessment of the deaf child. *Volta Review*, 1971(Feb), Vol. 73(2), 80-105. Reviews fundamental features of testing in general, and focuses on the problems of psychological deaf children. A fundamental purpose of psychological testing is the determination of mental level, although the nature of intelligence is by no means settled. The author has been able to find 11 tests specifically standardized on the deaf, of which 9 are intelligence tests. Basic points of test construction, test content, test administration, scoring, recording, and reporting are touched on. Nonlanguage performance test scales standardized on deaf children are listed, along with a chronological listing of selected evaluative studies of mental tests used with the deaf. (3 p. ref.) —W. A. Hass

9613 Nolan, Carson Y., & Bott, Joan E. (American Printing House for the Blind, Louisville, Ky.) Relationships between visual acuity and reading medium for blind children: 1969. *New Outlook for the Blind*, 1970(May), Vol. 54(5), 135-138

1971(Mar), Vol. 65(3), 90-96.—An every 3-yr review of the relationships between visual acuity, reading medium, grade level, and type of educational program for legally blind children made on data of 1966 has been reported in various studies. The present study based on data gathered as of January 1969 is a replication of the previous publications. Data reveal an increase of legally blind students registered with the American Printing House of 1,505; the greatest proportionate change in the multiple handicapped residential program with 29% increase of enrollment; a 2% student enrollment loss at residential schools (which are characterized by a population of relatively low visual acuity), a continuous general trend towards increased use of residual vision, etc. Technical improvement in the reporting system is noted. 7 tables indicate the various relationships.—*M. J. Stanford.*

9614. Northcott, Winifred N. **An experimental summer school: Impetus for successful integration.** *Volta Review*, 1970(Nov), Vol. 72(8), 498-507.—Regular classroom teachers need to gain competence and confidence in teaching hearing-impaired children in their classes. The Minneapolis Public School System initiated a workshop and summer school program to meet this need. The 1-wk workshop gave the 16 participating teachers new insights into the process of encouraging and motivating hearing-impaired children; the subsequent 5-wk summer school provided the opportunity for practical experience and application of techniques considered in the workshop. $\frac{1}{2}$ of the 120 summer school students were hearing impaired; $\frac{1}{2}$ had normal hearing. The staff of 38 included both general classroom teachers and special education teachers, as well as teacher aids. Team teaching was utilized throughout. A specific example of class activity is reported, in addition to some of the reactions of the teachers.—*W. A. Hass.*

9615. Parker, Ann L. (Pilot School for Blind Children, Washington, D.C.) **Reinforcement: One teacher's experiences and experiments with multiply handicapped blind children.** *New Outlook for the Blind*, 1971(Mar), Vol. 65(3), 97-99.—On the basis of personal experiences, it is maintained "that the creative use of reinforcement is a teaching tool of immense value in overcoming difficult learning problems." Overstressing of methods leads to forgetting the child, but careful planning of reinforcement around the child and the situation eliminates this danger, which is demonstrated in 3 examples. 1 blind, severely emotionally disturbed child could not be conditioned by oral, visual, or auditory reinforcement but responded to tactile stimulation (back-rubbing). A 9-yr-old blind child with manifestations of aphasia was not completely toilet trained. Playing with the venetian blind in the bathroom proved to be effective reinforcement. An emotionally disturbed, functionally retarded, 15-yr-old blind girl exhibited compulsively rude, negative, and destructive behavior. On a trip to circus she fell in love with clowns and asked to be called "Miss Clown" after a good performance on a task. This designation was used as helpful reinforcer.—*M. J. Stanford.*

9616. Parmenter, Trevor R. (Hassall State School for Mildly Intellectually Handicapped, New South Wales, Australia) **Self concept development of the partially seeing.** *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1970(Nov), Vol. 17(3), 178-185.—Self-concept inventories were administered to 30 adolescent partially seeing Ss who were

educated in a unit attached to a normal high school, and to a similar sample of normal stream pupils matched for age, sex, and IQ. Results indicate that there are no significant differences in self-concept development between the 2 groups. It is suggested that the opportunities afforded for academic success, together with the feelings of achievement which accrue from an integration program help to develop an adequate self-concept in the partially seeing. (17 ref.)—*Journal summary.*

9617. Pfau, Glenn S. (National Education Assn., Washington, D.C.) **Reinforcement and learning: Some considerations with programmed instruction and the deaf child.** *Volta Review*, 1970(Oct), Vol. 72(7), 408-412.—Attempted to determine the influence of different types of immediate reinforcement upon programmed learning by severely hearing-impaired adolescent deaf students. The experimental group included 208 11-16 yr. old Ss from 3 schools for the deaf. The task of each S was to learn 10 different unfamiliar animals by means of a program of instruction under varying conditions of immediate feedback. Results indicate that the type of immediate reinforcement had little effect upon errors either within, or at the termination of, the program. The findings and implications are discussed as related to classroom instruction.—*Journal abstract.*

9618. Prescott, Robin. (St. Christopher's Hosp for Children, Philadelphia, Pa.) **Acoustic puzzles: Auditory training games.** *Volta Review*, 1971(Jan), Vol. 73(1), 51-53.—Describes equipment for presenting sounds to children in a teaching-machine format. The child presses a button beside the picture which he thinks corresponds to the presented sound. If he is right, a lamp lights up. Some of the sounds are vocal, and some nonvocal. The equipment has been used by hearing-impaired children. *W. A. Hass.*

9619. Rooney, Alice G., et al. (Public School 47, New York, N.Y.) **A public school program for multiply handicapped deaf children as told to Beverly Jablons.** *Volta Review*, 1970(Dec), Vol. 72(9), 552-559. A program was developed for multiply handicapped deaf children who could neither function nor gain educational advancement in regular classes of a school for the deaf. It was tried out on a group of 30 8-11 yr. old Ss. 2 regular teachers were supplemented by 2 teachers specializing in the education of the deaf, 2 educational assistants, a secretary, and a social worker. To prepare a basis for education, the program initially devoted itself to motor and perceptual work. Ss came to be divided into 2 groups on the basis of rate of progress. Illustrative features of the curriculum are given. Examples of successes attained by students in the program give those who have participated in it confidence in its value. *W. A. Hass.*

Mental Retardation & Learning Disorder

9620. Clark, Margaret M. (1 Strathclyde Glasgow, Scotland) **Symposium on reading disability: III. Severe reading difficulty: A community study.** *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 14-18.—Studied children born between April 1 and August 31, 1959, in a Scottish community in order to assess the extent of severe reading difficulty in children of average intelligence. The 3-part investigation included (a) 1544 Ss in 70 schools, (b) 138 boys and 92 girls from the original sample who had a reading quotient of 85 or less on the Schonell Graded Word Test, and (c) 106 boys and 59 girls from the original sample who had no

independent reading skill and at least 1 IQ on the WISC of 80 or above. Follow-up studies on these Ss groups indicate that (a) severe reading difficulty in children of average intelligence was not a problem of the magnitude it was considered to be, (b) this difficulty becomes more intense with the passage of time, and (c) certain variables associated with reading difficulties cannot be considered causes.—P. Hertzberg

9621. Dombrowski, Walter. (U. California, Berkeley) Learning set for categorization as a differentiating characteristic for the placement and instruction of mentally retarded students. *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5896.

9622. Flax, Nathan. (585 Stewart Ave., Garden City, N.Y.) The contribution of visual problems to learning disability. *Journal of the American Optometric Association*, 1970(Oct), Vol. 41(10), 841-845.—Asserts that the control and integrative functions of the visual system influence learning more than the refractive state of the eye. Oculomotor control, intersensory integration, eye-hand coordination, visual directional orientation, facility, binocular function, and accommodation all contribute to learning disability. The ways in which each influence learning disability are discussed.—*Journal abstract*

9623. Goldberg, Herman K. & Arnett, William. (Johns Hopkins Hosp., Baltimore, Md.) Ocular motility in learning disabilities. *Journal of Learning Disabilities*, 1970(Mar), Vol. 3(3), 160-162.—Examined the technique of improving ocular motility to assist children with learning disabilities. The eye movements of 25 dyslexic children and a number of controls were examined with an electromyograph while reading materials above and below their frustration levels. Incoordinate eye movements were found in Ss with reading problems, but results do not support the theory that learning difficulties were due to lack of binocular coordination. It is concluded that the degree of comprehension produced the type of ocular movement, rather than the ocular motility producing the degree of comprehension.—*Journal abstract*

posium on reading disability: II. Specific learning difficulties in childhood: A medical point of view. *British Journal of Educational Psychology*, 1971(Feb), 41(1), 6-13.—Discusses prevalence and causes of reading and spelling difficulties. Analyses of the sociopsychological and the psychophysiological sources of reading disability, as well as the clinical classification, and case of specific dyslexia is not a disease, but "a syndrome which results from a number of different factors which are usually found in combinations." It is suggested that therapy should be based on an investigation of pre-learning difficulties on an individual level. (45 ref.)—Hertzberg

9628. Jackson, Nigel. (Aberdeen Coll. of Education, Scotland) Educable mental handicap and delinquency. *Educational Research*, 1970(Feb), Vol. 3(2), 128-134.—In a sample population of 232 mentally handicapped ex-pupils drawn from special schools in classes in a Scottish city and county, 29.8% of the boys and none of the girls had delinquent records. There was a marginal though not significant tendency for the delinquent youths to be more intelligent than the nondelinquent youths. A significant relationship was found between delinquency and (a) an absence of physical defect, (b) family neglect, (c) abnormal family structure, and (d) occupational instability. Those youths committing their 1st offense after leaving school were found to be significantly more intelligent than those whose 1st offense was committed while of school age. A relationship was found between post-school 1st offense, occupational instability, and high measured intelligence.—*Journal summary*

9629. Jacoby, Helen B. (U. Virginia) A comparison of mongoloid and non-mongoloid trainable retarded children on tasks of intentional and incidental learning. *Dissertation Abstracts International*, 1971, Apr., Vol. 31(10-A), 5233.

9630. Johnson, K. E. (Cromehurst Special School, New South Wales, Australia) Increasing the capacity to learn. *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1970(Nov), Vol. 17(3), 163-169.—Attempts to translate through cases the qualitative/quantitative positions of training techniques into specific terms. Case 1 describes a 15 yr. old with a deficiency in the visuomotor channel; Case 2 considers a 10 yr. old with quantitative deficiencies which were able to be changed positively to permit formal learning. The position is taken to indicate that traditional barriers to the development and education of the mentally handicapped will give way to assessment and development programs to enhance the level of competence.—C. A. Newcomer

9631. McLeod, John. (U. Saskatchewan, Saskatoon, Canada) Research into learning disability. *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1970(Nov), Vol. 17(3), 131-143.—Describes 4 reasons for the relatively low scientific standard of research in reading disability and learning failure. The absence of adequate theoretical formulations underlies the reasons presented. An interdisciplinary inquiry combined with education is advocated to improve research. Emphasis is given to the redeployment of services to the teacher. A survey of the literature indicates an increased attention to auditory perception skills as necessary for reading competence. Early identification of learning disability is briefly noted. (43 ref.)—C. A. Newcomer

9632. Miles, T. R. (University Coll., Bangor, Wales) **Symposium on reading disability: I. More on dyslexia.** *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 1-5.—Presents a debate on the classificatory justification for the term dyslexia. It is argued that dyslexia is a nosological concept, not just a nosographic one. Dyslexia is considered to entail the existence of certain characteristic behaviors (reading and spelling difficulties) which are constitutional in origin.—P. Hertzberg.
9633. Millman, Howard L. (Children's Village, Dobbs Ferry, N.Y.) **Minimal brain dysfunction in children: Evaluation and treatment.** *Journal of Learning Disabilities*, 1970(Feb), Vol. 3(2), 89-99.—Discusses the behavioral, psychological, and educational effects of minimal brain dysfunction with reference to the published literature. The need is outlined for the application of available knowledge leading to adequate evaluation and treatment. Methods of educating the staff, obtaining a case history, and performing psychological testing are discussed. When a central evaluation is not possible, the suggested diagnostic procedures are for pediatric neurological, developmental optometric, and speech and hearing evaluations. Specific recommendations that arise from the complete evaluation are discussed, with the necessity of reporting the results to the parents in a sensitive, meaningful manner. Recommendations include (a) special education, (b) medication, (c) developmental optometric training, (d) counseling or psychotherapy, (e) parent participation in associations, (f) recreational programs, and (g) parent counseling groups. (56 ref.)—*Journal abstract*.
9634. Mordock, John B. & Selvaggio, Vito J. **The childcare worker and sensory training.** *Devereux Schools Forum*, 1969, Vol. 5(1)—Discusses methods and techniques of sensory training in the home and in the visualized techniques for specific cases for use by the childcare worker. Emphasized is the fact "that education is not confined to the classroom [and that the] childcare worker as a member of the multidisciplinary team must not forget her educative function."—S. Knapp.
9635. Naidoo, Sandhya. **Symposium on reading disability: IV. Specific developmental dyslexia.** *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 19-22.—Discusses work conducted at the Word and the Blind Centre for Dyslexic Children in London and the constitutional basis for specific reading difficulties associated with developmental anomalies and delays inherent in specific dyslexia. 4 hypotheses involving genetics, cerebral dominance, isolated developmental delays, and organic brain dysfunction in relation to specific dyslexia are considered. It is suggested that "specific dyslexia and its alternative terms, are similarly useful to distinguish children whose specific reading disability is associated with developmental delays, minor neurological dysfunctions or isolated maturational lags which are indicative of inherent developmental anomaly." (32 ref.)—P. Hertzberg.
9636. Norn, M. S., Rindziunski, Eva, & Skydsgaard, H. **Ophthalmologic and orthoptic examinations of dyslexics.** *Skoletpsykologi*, 1970, Vol. 7(6), 333-349. Ss studied 117 dyslexic children, constituting the total number of pupils from a school with specific remedial reading classes, and a comparable control series of 117 pupils from a normal school. The examinations performed showed that dyslexia is not due to refractive errors.
- impaired visual acuity, or orthoptic disorders. A doubtful preponderance was noticed of mild hypermetropia, slight astigmatism, and latent strabismus to near vision. Orthoptic treatment was indicated in 4% of these cases. There was a preponderance of crossed eye-hand dominance. It is concluded that word-blind children should be subjected to particular careful ophthalmological examination to prevent possibly existing visual anomalies from accentuating the true reading difficulties. No causal relation exists between specific dyslexia and visual defects in their widest sense. (16 ref.)—*Journal summary*.
9637. Oaks, Merrill M. (U. Maryland) **An evaluation of the effectiveness of a developmental sequence for teaching an industrial education psychomotor task to young severely mentally retarded students.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5889-5890.
9638. Rappaport, Sheldon R. & McNary, Shirley R. (Pathway School, Norristown, Pa.) **Teacher effectiveness for children with learning disorders.** *Journal of Learning Disabilities*, 1970(Feb), Vol. 3(2), 75-83. Considers that the teacher of children with learning disorders requires personality characteristics, training, and function different from the authoritarian stereotype to be effective in rehabilitating such children. The selection of teachers, university and inservice training, the role and organization of the team, and teacher supervision are discussed. Suggestions are presented for changing the roles of available nurses, psychologists, reading, speech, and physical education specialists. It is concluded that optimal success with these children will require a change in concepts on the part of university and public school administrators. *Journal abstract*.
9639. Rice, Donald B. (Indiana U., Medical Center, Indianapolis) **Learning disabilities: An investigation in two parts.** *Journal of Learning Disabilities*, 1970(Mar), Vol. 3(3), 149-155.—Presents data gathered over a 2 yr period from 190 6-16 yr. old children in a dyslexia clinic. The diagnostic procedure included (a) school history, (b) ophthalmologic examination, (c) psychoeducational evaluation, (d) pediatric neurology examination and (e) case conference. 6 categories of learning disabilities and case conference. 6 categories of learning disabilities were 1 category where no significant disability was found were distinguished and are described. It was found that (a) the ratio of males to females was 5 to 1, (b) mean WISC Verbal and Performance IQs were not significantly different, (c) only 8 cases showed reading disability alone, (d) 43% had no significant academic deficit, (e) 28% showed significant emotional difficulty, (f) 20% were dyslexic, (g) there were significant deficits in visual-motor integration and auditory perception and (h) there was a low incidence of uncorrected visual problems. The importance of a multidisciplinary approach to the treatment of children with learning disabilities is stressed.—S. Knapp.
9640. Rosner, Jerome. (U. Pittsburgh Learning Research & Development Center) **Screening for perceptual dysfunction.** *Journal of the American Optometric Association*, 1970(Oct), Vol. 41(10), 858-866. Discusses the obligation of every optometrist to screen for perceptual dysfunction in those cases where a learning disability exists. In addition, given positive indications of perceptual dysfunction, more extensive services or referral to an appropriate resource should be provided. Easily administered perceptual tests which may serve as an elementary screening instrument are presented (Word Repetition, Auditory Repetition, Cessell

Developmental Factors and Rogers Drawings Test. Scoring criteria and further references are offered. An attempt is made to locate references to these tests and other more traditional aptitude measures. References are listed. *Journal abstracts.*

9641. Silverman, Mitchell. (U. South Florida) Developmental trends in the vocational interests of special education and normal students. *Journal of Vocational Behavior*, 1971(Jan), Vol. 11(2), 1-17. —

Attempted to analyze the development of vocational interests in special education and normal students. 47 normal and 47 retarded Ss ranging in age from 2-18 yr. were tested on a personal measure of vocational interest. Significant age and group differences were noted on a number of occupational clusters derived on the basis of Ss' response to the measure. Group differences were interpreted in terms of differential early experience between retardates and normals. Significant developmental trends were analyzed in terms of general to specific response trends, developmental lag, and the differential educational experiences of the 2 groups. *Author abstract.*

9642. Taylor, Z. Ann & Sherrill, Claudine. (Hastop Coll.) The development of a core curriculum in health and safety education for trainable mentally retarded children. *Journal of School Health*, 1971(Apr), Vol. 34(2), 183-188. —

Tested the following 4 hypotheses: (1) Through participation in a core curriculum in health and safety education, trainable mentally retarded children can make progress toward self-realization, (2) toward human relationships, (3) in the attainment of economic efficiency, and (4) in the assumption of civic responsibility. 9 retarded 10-14 yr. olds were studied for a 10-wk period. 3 original rating scales with a 5-point range were developed rating the Ss on knowledge and understanding, attitude and appreciation, and specific practices relating to the general objectives of education. Through participation in the core curriculum Ss made some observable progress toward the attainment of economic usefulness. The most dramatic change occurred in relation to self-realization. Ss began to see themselves as capable of accomplishment and thereby became more responsible.

Emotional Disorder

9646. Huessy, Hans R. & Gendron, Richard M. (U. Vermont) Prevalence of the so-called hyperkinetic syndrome in public school children of Vermont. *Acta Paedopsychiatrica*, 1971(Sep), Vol. 37(9-10), 243-248. — 501 7-yr-old children, when rated for hyperkinesis cases by 3, but were joined by new recruits, some of

whom had previously shown no signs. The permanency of the syndrome is questioned. A purely organic etiology would seem tenable for those developing the syndrome after successful drug therapy is probably the symptoms of short attention span, emotional reactivity and impulsiveness, not for the onset of chronic. G. Rubin-Rabson.

9647. Lehrman, Wendy. (Brooklyn Coll., City U. New York) A school guidance class for emotionally disturbed children. *Children*, 1969(Sep), Vol. 30(3), 18-21. —

Focuses on the theory that basic principles of behavior therapy as well as teaching of emotional control should be as to teaching of normal children. The classroom teacher has a broad responsibility to create a positive program for the physical, mental, social, and emotional development of each child. Makes use of the classroom as an appropriate setting for rehabilitation of the disturbed child. While the child is learning to develop and maintain constructive ties with crucial members of the society, he is also receiving help from the classroom itself. A classroom environment that offers frequent opportunities to each child to make his own decisions about the world and to develop his social skills is needed. *Journal summary.*

9671. Layton, Wilbur L., Sandeen, C. Arthur, & Baker, Ronald D. (Iowa State U.) Student development and counseling. *Annual Review of Psychology*, 1971, Vol. 22, 533-564.—Reviews the literature, stressing (a) student development including vocational behavior and development, (b) counselor training, (c) counseling research methods, (d) counseling process research, and (e) challenges to counseling. It is concluded that counseling psychologists have given most of their attention to helping students with perceived problems who sought counselors' services. If counseling psychology is to assume its "responsibility," then counselors must become more creative and active in providing experiences which will stimulate positive development of students who are not focusing on their problems, but who can be persuaded to participate in growth producing experiences. The expanding literature reporting research on student development is considered helpful to the counseling psychologist. (96 ref.) *Journal summary*.

9703. Koran, Mary L., Snow, Richard E., & McDonald, Frederick J. (U. Texas) **Teacher aptitude and observational learning of a teaching skill.** *Journal of Educational Psychology*, 1971(Jun), Vol. 62(3), 219-228. Investigated individual differences in acquiring a teaching skill from written and video-mediated modeling procedures. 121 intern teachers were given aptitude tests representing verbal and perceptual abilities (selected from the Educational Testing Service's Kit of Reference Tests for Cognitive Factors and from a series of film and audio tests) then randomly assigned to a of film and audio tests) then randomly assigned to a video-modeling, written-modeling, or no modeling treatment. Criterion performances were the frequency, variety, and quality of the modeled teaching skill used on 3 separate microteaching sessions and on 3 written measures. Analysis of variance results show that video modeling produced significantly higher performance frequencies than written modeling, with both modeling treatments significantly outperforming the control treatment. Regression analyses of Aptitude \times Treatment interactions show that Hidden Figures, Maze Tracing, Film Memory, and Sentence Reproduction scores interacted significantly with the modeling treatments.—*Journal abstract*.

(Bard Coll.) **Instructor attitudes toward, and their use of, student ratings of teachers.** *Journal of Educational Psychology*, 1971(Jun), Vol. 62(3), 235-239.—Assigned 36 teaching assistants in 3 freshman courses to groups on the basis of an attitude scale measure (the Survey of Student Opinion of Teaching) regarding the value they ascribe to student ratings of teachers. Ss were then randomly assigned to 4 groups, varying in attitude and feedback from student ratings. Differences between attitude and feedback groups were examined using as criterion measures end of semester ratings and final examination scores, adjusted by analysis of covariance using midsemester ratings and examination scores as covariates. Ss in feedback or attitude groups did not differ significantly on their end-of-semester ratings. In 2 classes there were no significant differences on the final exam scores, while in the 3rd class, final examination scores were higher for those students whose teachers received feedback from the ratings.—*Journal abstract*.

Assigned 8 22-56 yr old female Os to rate the classroom techniques of 58 Program for Learning in Accordance with Needs (PLAN) teachers and 28 control teachers. As predicted, PLAN teachers using individualized instruction spent significantly more time than control teachers at all levels and at all levels combined, in diagnostic and didactic inquiry and in total individual instruction. Contrary to predictions PLAN teachers at every level spent more time than control teachers in managing learning materials but the difference was significant only when all levels were combined. The secondary level control teachers spent significantly more time than the PLAN teachers in giving positive messages within behavior modification. Also contrary to the hypotheses PLAN teachers spent significantly more time than the control teachers in managing student activities at the primary and intermediate level, and all levels combined (16 rel.).—*Journal abstract*.

9714 Wragg, Mark (Coventry Poly. Coll., U. London, England) Teaching educational psychology in India. *Educational Research*, 1969(Jun), Vol. 1(2), 126-131.

Using 5 teacher training English-speaking institutions, 219 men and 214 women taking educational psychology were surveyed. Some lecturers had no formal specialization in psychology. All courses provided a reasonably satisfactory grounding in the main topics. More need created for practical experiences and industry visits. The supply of good textbooks appeared to be inadequate. It is suggested that the Indian trend of conservatism makes difficult any reform in teacher training and the teaching of educational psychology. (29 refs.)—G. S. Rutter.

9715 Zedler, Empress Y. (Southwest Texas State U.) Better teacher-training: The solution for children's reading problems. *Journal of Learning Disabilities*, 1970(Jan), Vol. 6(2), 106-112. Considers that the goal of teachers for children with reading problems should be prevention at the kindergarten and primary levels rather than remediation at later levels. Student teachers should 1st acquire a broad eclectic background of knowledge from which they can develop frameworks for understanding: (a) children who learn normally and those who do not; (b) the nature of language; (c) the process of learning itself; and (d) the psychologies of language and learning. Out of such knowledge student-teachers should develop skills: (a) in evaluating learning abilities; (b) in regular diagnostic and therapeutic teaching; (c) in relating to and strengthening the self-concepts of children with learning problems; (d) in communication with related professions; and (e) in evaluating and participating in high-quality research. The necessity for supervision during training by professors with great competence in these areas is stressed.—S. Anapp.

9716 Adams, Ernest L. (Michigan State U.) Influence of meaningfulness and familiarization training on basic sight vocabulary learning with first-graders. *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5832.

9717 Amaría, Roda P., Biran, L. A., & Leith, G. O. (U. Birmingham, National Centre for Programmed Learning, Exbury, England) Individual versus cooperative learning: I. Influence of intelligence and sex. *Educational Research*, 1969(Jun), Vol. 1(2), 6-103. In a series of experiments the proposal tested was that learning could be profitably undertaken on a cooperative, i.e., nonindividual, basis. 10 and 12 yr olds worked individually, in homogeneous ability pairs and heterogeneous ability pairs. Learning tended to be best for heterogeneous pairs for higher and lower ability children, although the overall pattern of results was very complex. It is suggested that cooperative learning requires the intelligent child to spend time in organizing the concepts and operations for the less intelligent child which facilitates mastery for both. It is concluded that for programmed learning cooperative work is fully as effective as individual work and takes no longer in time.—G. S. Rutter.

9718 Amaría, Roda P. & Leith, G. O. (U. Birmingham, National Centre for Programmed Learning, Exbury, England) Individual versus cooperative learning: II. The influence of personality. *Educational Research*, 1969(Jun), Vol. 1(2), 103-119.

In Exp. I, 11 boys and 57 girls were divided by ability and sex into 4 groups: (1) worked individually, (2) worked in homogeneous ability pairs, (3) worked in heterogeneous ability pairs, and (4) worked in cooperative mixed ability pairs. In Exp. II, 11 boys and 57 girls performed better than the other groups in mixed ability pairs, bright males and low-ability females performed somewhat better than the other groups in similar ability pairs. For lower ability children, the pattern was reversed. In Exp. II, 4 boys and 12 girls were paired as follows: anxious introvert with low-ability extrovert and anxious extrovert with low-ability introvert. For boys, introverts were better than extroverts in mixed ability pairs and worse in similar ability pairs. For girls, low-ability introverts were better than low-ability extroverts in mixed ability pairs. Low-ability girls performed well in mixed ability pairs and mixed pairs in similar ability pairs. Anxiety had no effect on the difference found when introverts extroverts worked with each other.—G. S. Rutter.

9721 Bart, W. M. (U. Minnesota) The factor structure of formal operations. *British Journal of Educational Psychology*, 1971(Jan), Vol. 41(1), 7-14. Administered 4 Piagetian formal thought tasks, formal operational reasoning tests, and a test of verbal intelligence (the Experimental Omnibus Vocabulary Test) to 80 scholastically above-average adolescents, 16 at each of 3 age levels (13, 16, and 19 yr. of age). The formal reasoning tests provided scores indicating level of formal reasoning in each of 3 content areas—biology, history, and literature respectively. It was hypothesized that formal operational skills are unifactor, with the use of maximum likelihood factor analysis, it was determined that the 8 measures had a bifactor structure with a large general factor and a secondary factor which distinguished tasks from tests. Also formal thought was found to have a substantial verbal intelligence component as well as nonverbal intelligence components.—Journal abstract.

9722 Bart, William M. (U. Minnesota) The effect of interest on horizontal décalage at the stage of formal operations. *Journal of Psychology*, 1971(Jun), Vol. 78(2), 141-150. An interest test and 3 formal reasoning tests were administered to 90 13-, 16-, and 19-yr-old scholastically above-average students indicating S's degree of interest in biology, history, and literature, and his level of formal reasoning in the same 3 areas. From Goodman-Kruskal γ statistical procedures, it was determined that level of interest has little or no association with level of formal reasoning throughout the stage of formal operation, thus, disaffirming the hypothesis that interest has a decreasing differential cognitive effect at the stage of formal operations. An alternative hypothesis that concrete reasoning in 2

content area must precede formal reasoning in that area was presented with confirming evidence.—*Journal summary*.

9723. Beane, William E. & Lemke, Elmer A. (Stout State U.) **Group variables influencing the transfer of conceptual behavior.** *Journal of Educational Psychology*, 1971(Jun), Vol. 62(3), 215-218.—Investigated the role of group heterogeneity and ability level in previous research which indicated that while groups can solve more problems than individuals, on subsequent individual transfer problems, the effect of group participation is lost. 64 undergraduates were stratified by ability level (using the Otis Quick-Scoring Mental Ability Test) and randomly assigned as homogeneous or heterogeneous pairs or quads to attain either 3 or 7 training concepts. Following training, each S participated individually on 3 transfer concepts. Results indicate that training low-ability Ss as homogeneous quads facilitated individual transfer performance. 9727. Combessie, Jean C. (U. Paris, France) **Educational et valeurs de classe dans la sociologie américaine.** [Education and class values in American sociology.] *Revue Française de Sociologie*, 1969(Jan), Vol. 10(1), 12-36.—Describes the different levels at which empirical American studies use the notion of values to explain unequal school achievement of children belonging to different social classes. According to the level of aspiration expressed by parents or children, these studies establish the difference in ambition, disregarding objective, socially conditioned opportunities. A negative description of the values of lower social classes is given; which in turn, invites the conclusion, that this process is voluntary. Unequal achievement by unequal ambition is justified. Study of education in the family environment shows the school as a nonautonomous element and is logically dependent on a whole system of values. These values vary qualitatively according to social class. Studying the system of values in itself without relation to the objective characteristics of class, status, and range of experience is not justified. When all these factors are considered the voluntary explanation is excluded. The article aims at ordering these American studies as a function of the coherence and realism of the type of explanation proposed. (Spanish, German, & Russian summaries)—*English summary*.

9728. Cummings, Ruby N. (U. Alabama) **A study of the relationships between self-concepts and reading achievement at third-grade level.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-A), 5195.

9729. Dwyer, Francis M. (Pennsylvania State U., University Div. of Instructional Services) **Questions as advanced organizers in visualized instruction.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 261-264.—Attempted to measure the effectiveness with which ques-

tions function as advance organizers in complementing visualized instruction. Questions preceded each visualized page in the instructional booklets and were designed to direct S attention to relevant learning cues. Each S (N = 266 undergraduates) received a pretest, participated in his respective visualized presentation, and received 4 individual criterion measures. Analyses indicate that (a) the use of questions as advance organizers in visualized instruction is not an effective instructional technique for increasing S achievement of different types of learning objectives, and (b) different types of visuals when preceded by questions are not equally effective in facilitating S achievement.—*Journal summary*.

9730. Epps, Edgar G., Katz, Irwin; Perry, Aubrey, & Runyon, Eugene. (U. Chicago) **Effect of race of comparison referent and motives on Negro cognitive performance.** *Journal of Educational Psychology*, 1971(Jun), Vol. 62(3), 201-208. Conducted 2 replications of a study by I. Katz, E. Epps, and I. Axelson (see PA, Vol. 39:1421) on the effect of racial variation of a peer comparison group on the cognitive performance of Negro male college students. Samples of 86 and 219 male undergraduates were drawn from 1 southern and 1 northern Negro college, both of which had higher academic standards than existed at the college used in the earlier experiment. Ss were tested, using an achievement motive questionnaire (a multiple-choice version of the French Test of Insight) and Sarason and Ganzer's Test Anxiety Scale. As predicted, Ss tested by Negro Fs at both colleges on arithmetic, scrambled words, and digit-symbol substitution tasks performed better when the comparison group was Caucasian rather than Negro. This reversed the finding of the previous study, in which only the digit-symbol task was used. Success approach and failure-avoidance motives had limited effects on task behavior, and these effects tended to be independent of the peer comparison effect.—*Journal abstract*.

9735. Heiler, Kurt. (Heidelberg Coll. of Education, Inst. of Pedagogy, W. Germany) **Psychologische Untersuchungen zur Erfassung der Schulleistungsreserven.** [Psychological investigations for the assessment of school talent reserves.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(4), 223-240.—Describes an empirical study investigating talent reserves among 4,068 secondary school students. An IBM program (automatic classification) was used to classify talent and achievement. The aptitude of 3 complete age groups (Grades 6, 7, and

8) with a total N of 288,000 in 1 different types of which could be determined. Results are given in percentages of students rated as talented and suitable for different types of high schools. By comparing the empirical with the automatically classified groups using test achievement, personality and sociographic characteristics, questionnaires or personal ratings of the teachers, it was possible to obtain information on the psychology of intelligence and important explanations of the motivational and sociocultural structure as well as data informing about the social and regional distribution of talent resources. Methodological advantages of the automatic classification model for the differentiation of talented students are discussed as well as practical consequences and educational-psychological means to activate talent reserves. 9743. Matei, Constantin N. Raportul dintre percepție și reprezentări în cadrul procesului de învățământ. [The ratio between perception and representation within the educational process.] *Revista de Pedagogie*, 1969 (May), Vol. 18(5), 22-31. Considers representations as mental patterns which orient behavior

and attitudes and as the basis of concept production. The process of perceptual configuration and verbal configuration in computer representation were experimentally investigated under 2 aspects: (a) the ratio in 5th-grade pupils' minds between the perception of the demonstration and the verbal explanation of the teacher, and (b) the ratio in 5th-grade pupils' minds at the end of the reading stage between the perception of the written word and the understanding of its significance by reanimation in the verbal explanation of the teacher. Using batteries of typewritten and demonstrative lessons, the conclusion is drawn that the process of configuration is different for each pupil. 4 general, dominant elements are distinguished which have specific structures for representations. Implications for educational views of the process of knowledge acquisition are discussed. (Russian & French summaries).—*English summary.*

9744. McQueen, William M. (U. South Carolina) The effect of divergent teacher expectations on the performance of elementary school children on a vocabulary learning task. *Dissertation Abstracts International*, 1971 (Apr), Vol. 31(10-A), 5206-5207.

9745. Means, Gladys H., Means, Robert S., Castleman, Judy N., & Elsom, Billy F. (Oklahoma State U.) Verbal participation as a function of the presence of prior information concerning aptitude. *Canadian Journal of Educational Research*, 1971 (Mar), Vol. 22(2), 58-63.—72 undergraduates were told that they were being administered an aptitude test that had been used previously to help predict achievement in the course. Ss were rank ordered by past GPA. The median break was used to form 2 groups: high and low GPA. Ss within each group were randomly assigned to 1 of 3 treatments. Treatment 1 Ss were told that from the results of the aptitude test it would appear that they had high aptitude for mastery of the concepts taught during the course. Treatment 2 Ss were told that their test scores revealed little aptitude for the course. Treatment 3 Ss were given no information regarding their aptitude. A 2×3 analysis of variance was employed to analyze student's verbal participation in a structured situation. Results indicate no significant differences from treatments, but significant differences were found favoring high GPA over low GPA. A significant interaction effect showed high GPA Ss participating more when given negative information whereas low GPA Ss participated more when given positive information.—H. J. McWhinnie.

9746. Miller, Marge M. (Ball State U.) The relationship between attitudes toward reading and achievement in reading in first grade. *Dissertation Abstracts International*, 1971 (Apr), Vol. 31(10-A), 5207-5208.

9747. Nygård, Roald. (U. Oslo, Inst. for Educational Research, Norway) Motive to approach success and motive to avoid failure in boys from different social groups. *Scandinavian Journal of Educational Research*, 1969, No. 4, 222-232. Examined differences between social groups in achievement-related motives in a sample of 255 7th and 8th grade boys. Motive to avoid failure was measured by the Test Anxiety Scale for Children, while the motive to approach success was anchored in the score on the TAT-N Achievement Test. Analysis of regression reveals a clear relationship between social background and motive to avoid failure, higher social groups being less failure motivated ($p < .005$). This

relationship seems to hold even when differences between the groups in intelligence are controlled ($p < .05$). Results of a corresponding analysis regarding the motive to approach success did not reach significance ($.05 < p < .10$). There were, however, clear trends when measures for the 2 motives were combined. Ss with a high motive to approach success and a low motive to avoid failure made up an increasing proportion, and those with a low motive to approach success and a high motive to avoid failure made up a decreasing proportion, when going from lower to higher social groups. 9752. Smiljanić-Colanović, Vera. **Gotovost dece za polazak u školu, od čega zavisi i kako se utvrđuje.** [School readiness: On what does it depend and how is it assessed?] *Psihologija*, 1969-1970(Oct), Vol. 3(1), 63-73.—Defines readiness for learning as the child's ability to respond to instruction. This ability involves the child's physical, intellectual, social, and emotional maturity, previous experience, and motivation for learning. It is the result of a complex interaction between hereditary and environmental influences. Therefore, well-timed school instruction which corresponds to a child's physical and emotional maturity is considered important. The task of those responsible for the determination of a child's readiness for elementary instruction is considered to be a delicate and important one. Readiness of children to start attending school may be influenced in early childhood and the preschool period. The earlier the date of such influences, the better the effect. (Russian summary)—*English summary.*

9753. Smith, I. Leon. (U. Cincinnati) **IQ, creativity, and achievement: Interaction and threshold.** *Multivariate Behavioral Research*, 1971(Jan), Vol. 6(1),

51-62.—Based on Torrance's threshold concept, IQ and creativity measures were expected to be differentially related to tests of convergent and divergent achievement over varying intellectual levels. An IQ test, achievement measures derived from B. S. Bloom's *Taxonomy of Educational Objectives: Cognitive Domain*, and 3 creativity tests were administered to 141 11th graders. The data were analyzed through the use of multivariate interactive and linear regression models. Results indicate that the relationships between creativity and the 2 types of achievement are generally linear. Although intelligence is the major variable related to the convergent criteria, creativity, in addition to IQ, appeared as a necessary dimension in performance on the divergent criteria. Findings are discussed in terms of the teaching for and measurement of creativity. (23 ref.) *Journal abstract.*

9760. Williams, John D., Harlow, Steven D., & Borgen, Jerome S. (U. North Dakota, Div. of Measurement & Statistics) **Creativity, dogmatism, and arithmetic achievement.** *Journal of Psychology*, 1971(Jul), Vol. 78(2), 217-222.—2 groups of upper elementary students were formed on the basis of their total arithmetic scores on the Iowa Tests of Basic Skills, a high and a low arithmetic achievement group. The groups were, respectively, the upper and lower thirds of a total of 483 students. 3 measures of creativity (fluency, flexibility, and originality) prepared by Guilford and a measure of dogmatism prepared by Figgert were administered to both groups. The high arithmetic achievement group scored high ($p < .001$) on the 3 measures of creativity, but there was no significant difference on dogmatism. Also, no significant correlation was found between dogmatism and any measure of creativity.—*Author abstract.*

9762. **Wierman, John H.** (Children's Center, Salt Lake City, U.) **Cognitive style and reading ability.** *Canadian Journal of Educational Research*, 1971(Mar), Vol. 22(1), 34-39.—Explored the relationship between reading ability and cognitive style in 270 elementary school students. Reading ability, within the 4th and 5th grades, was measured by the California Reading Test-Flemontary within the 6th grade by the Reading Vocabulary and Reading Comprehension subtests of the California Achievement Test-Flemontary. Cognitive style was measured through the use of Witkin's scoring procedure for human figure drawings. The hypothesis that field-independent children are more advanced in reading ability than field-dependent children was supported. Correlational results suggested a relationship of moderate strength for both boys and girls within the 4th and 5th grades; virtually no relationship was found within the 5th grade male and female subgroups. —H. J. M. Whinnic.

9766. **Grinnell, Marilyn; Keeley, Stuart M., & Doherty, Michael E.** (Bowling Green State U.) **Bayesian predictions of faculty judgments of graduate school success.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 379-387.—15 faculty members (judges) inspected distributions of scores on 4 predictor variables of students who had been accepted into graduate school. Given only the information that a judge estimated the prior probability of achieving a PhD, $P(H)$. Judges also estimated the probabilities of the various values of 4 predictor variables given success, $P(D|H)$, and, finally, individual subjective posterior probabilities of success, given 1, 2, and 4 predictor variables. The judges' $P(H)$ and $P(D|H)$ values were used to compute, under the assumption of independence, Bayesian posterior probabilities, used as a criterion measure for the judges' predictions. In a relatively natural situation, $P(H)$ and $P(D|H)$ values built on individual differences arose in the 1 type of information condition. Conservatism was observed when multiple predictors were aggregated. —Journal abstract.

9771. **Stanley, Julian C.** (Johns Hopkins U.) **Predicting college success of the educationally disadvantaged.** *Science*, 1971(Feb), Vol. 171(3972), 640-641.—For review, e.g., those of the Scholastic Aptitude Test predict the college grades of educationally disadvantaged students as well as they do those of the advantaged. Regardless of socioeconomic level, students who are predicted to earn low grades within a particular course will tend to have academic difficulties if enrolled in it. There are justifications for admitting to a particular college some minority-group students who are marginally qualified provided they are given adequate financial aid and effective remedial courses. However if entrants are greatly underqualified academically, new curricula will be required, which may tend to segregate them from the regular student body. Also, a degree from a special curriculum may not be viewed by employers, graduate schools, and alumni as equivalent to other degrees awarded by the institution. Admitting students who are seriously underqualified academically seems likely to cause frustrations that may be difficult to resolve. Current demands by minority groups for "relevant" courses may reflect the academic difficulties many of their members encounter in present courses rather than the educational unsuitability for them of such courses. (48 ref.)—*Journal summary*.

9772. **van Nieuwen, R. F.** (U. Amsterdam, Psychological Lab., Netherlands) **Een model voor tentamens.** [A model for preliminary examinations.] *Nederlandsche Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Feb), Vol. 26(2), 121-132.—Presents a mathematical model based on a series of formulas, to assist in the selection of successful candidates for graduation at Dutch universities. The selection process is largely based on performance on preliminary examinations. The candidate must pass a number of such examinations but is free to choose the order of succession of the tests. If he fails, he may repeat the test any number of times. The importance of the memory factor in the performance on the preliminary examinations is reflected in the assumption that learning occurs according to the all-or-none model. Although the knowledge of the performance of a candidate in terms of the total indicate his behavior in a specific subject area, the total performance of a student must be considered in terms of calculated risks that are based on the total personality of the candidate. An outline is given of how "knowledge of the model may influence the behavior of the teacher and of the student." (English summary)—A. J. Ter Keurst.

9773. **Wiggins, Nancy & Kolen, Eileen S.** (U. Illinois) **Man versus model of man revisited: The forecasting of graduate school success.** *Journal of Personality & Social Psychology*, 1971(Jul), Vol. 19(1), 100-106.—Tested the hypothesis of L. Goldberg (see PA. Vol. 44:12828)

that the model of man is superior to man in clinical judgment situations other than clinical diagnosis of the MMPI. 98 psychology graduate students were asked to forecast 1st-yr graduate GPAs based on 110 profiles containing 10 cues derived from their fellow students' records. For each S, the cue values were regressed onto the Ss' judgments (the model of man). Results indicate that the models (predicted judgments) were more accurate than the Ss' own judgments when correlated with the actual criterion. The average judgments for each profile were considerably more valid than the average of the judges' individual validities. Even the average judgments were improved upon by modeling. It is recommended that the model of man substitute for man in forecasting graduate GPAs. (22 ref.)—*Journal abstract*.

9774. Zedeck, Sheldon; Cranny, C. J., Vale, Carol A., & Smith, Patricia C. (U. California, Berkeley) **Comparison of "joint moderators" in three prediction techniques.** *Journal of Applied Psychology*. 1971(Jun), Vol. 55(3), 234-240.—Examined the existence of 2 potential "joint moderator" variables (anxiety and study habits), and compared their operation according to 3 different prediction techniques: (a) subgroup analysis, (b) differential prediction of predictability, and (c) moderated regression. Results with 393 undergraduates indicate that anxiety moderated the relationship between GPA and American College Test scores using subgroup analysis and differential predictability techniques. A comparison of moderated regression with linear regression indicated that study habits operated as an independent predictor. None of the techniques identified joint moderators in this situation. Results are discussed in the light of problems and assumptions of each technique. The need for systematic identification of moderators from a large mass of data is indicated. (17 ref.)—*Journal abstract*.

Overachievement & Underachievement

9775. Glavach, Matt & Stoner, Donovan. (48 Woodlyn Lane, Bradbury, Calif.) **Breaking the failure pattern.** *Journal of Learning Disabilities*. 1970(Feb), Vol. 3(2), 103-105.—Conducted an experiment with 24 9th graders who tested 2 yr. or more below the expected grade level. It was hypothesized that these Ss would like to learn and, if presented with appealing material with a guarantee of success, would learn. 1 page exercise sheets which depended on puzzle or problem solving for interest were created and sequenced. Materials were presented to Ss at a level where initial success was guaranteed. Exercises in a level where initial success was guaranteed. Exercises were presented during the school year. Each exercise was given a certain point value, and points could be exchanged for model airplanes and ships, field trips, and the grade of A. After evaluation at the end of the year, 11 Ss were assigned to regular classrooms and were doing successful work.—S. Knapp.

9795. Jung, Steven M. (American Inst. for Research, Palo Alto, Calif.) **Evaluative uses of unconventional measurement techniques in an educational system.** *California Journal of Educational Research*, 1971(Mar), Vol. 22(2), 48-57.—Reports on results generated by an unconventional application of the testing paradigm. This application was made necessary by the nature of several goals of Project PLAN, a comprehensive system of individualized education, in the areas of student personal and social behavior, self-planning skills for occupational and personal development, etc. Attainment of such goals is very difficult to measure using standard educational procedures. The critical incident technique was used to identify important aspects of student behavior. These were felt to represent positive exemplars of these behaviors. From this basis, student self-report procedures were developed. These procedures were applied to situations which were structured according to cues obtained from the original critical incidents. Results indicate the degree to which the goals had been obtained, both in an absolute sense and in comparison with the results of more conventional educational programs.—*H. McWhinnie*.
9796. Lee, Ronald A. (U. Oklahoma) **The effects of competition on various measures of stress on male college age students.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-A), 5825.

9798. McCormick, Clarence C. & Schnobrich, James N. (Developmental Achievement Center for Children & Adults, Niles, Ill.) **Longitudinal corroboration of a cross-sectional study of development of preschool children with the Arrow-Dot Test.** *Perceptual & Motor Skills*, 1970(Feb), Vol. 30(1), 269-270.—58 3-6 yr. children in a Montessori preschool were administered a series of tests at the beginning of the school yr. and were retested on the same battery 8 mo. later, at the end of the school yr. The Ss exhibited a mean gain of about 11 points on the Peabody Picture Vocabulary Test. They also exhibited a decline in Impulsivity and an increase in Superego scale scores, on the average, measured by the Arrow-Dot Test. These longitudinal results corroborate an earlier cross-sectional analysis, and, as these results follow a prediction from Freudian theory, give indication of construct validity for the test.—*Journal abstract*.
9799. McGreevy, C. Patrick. (U.S. Office of Education, Washington, D.C.) **A new design of pupil personnel service programs utilized by the U.S. Office of Education (BEPD).** *Counseling Psychology*, 1971, Vol. 2(3), 88-91.—Describes a new program designed to generate education reform through personnel training. The 2 goals of the Bureau of Educational Personnel Development are the enhancement of educational opportunities for low income families and a heightened responsiveness to the pupil by the educational system. The Pupil Personnel Services Program emphasizes trainer preparation as pupil personnel specialists for both pre- and inservice activity. The program calls for a "center-satellite" system consisting of a "university-school district(s)-community" as a coordinating-training center. The center (with its satellite schools) will have as its major responsibility the improvement of Pupil Personnel Services to a particular low income area.—*W. S. Sahakian*.
9800. McWhinnie, Harold J. (U. Maryland) **A third study of perceptual behavior in sixth grade children in relation to their behavior in art.** *California Journal of Educational Research*, 1971(Mar), Vol. 22(2), 68-73.—Measured the relationship among 4 perceptual variables that previous research had identified as relevant to human behavior in art. The perceptual variables studied were: (a) perceptual field independence, and (b) level of

differentiation in figure drawing. 90 6th graders were tested on a battery of perception and creativity tests as a part of a large study of perceptual training in art. For the purposes of this study pretest scores were used in a correlational analysis. The variables selected seemed to measure discrete areas of perceptual behavior. The findings did not replicate previous work done in this area. Results are discussed with reference to implications for the teaching of art as well as for further research into variables of the psychology of art. *Author abstract.*

9804. Radu, I. (U. Babeş-Bolyai, Cluj, Romania) **La dynamique des relations entre concepts et opérations intellectuelles chez les écoliers.** [Dynamic relations between concepts and thought processes in school children.] *Revue Roumaine des Sciences Sociales-Serie de Psychologie*, 1970, Vol. 14(2), 193-206. Concepts and cognitive operations constitute interdependent elements of learning which have different implications for programmed instruction. In teaching, concepts may be followed by generalizations or rules followed by illustrative examples. Binary programmed instruction is reported to be more effective for learning based on identification using perceptual cues while algorithmic approaches are more successful for sequential learning requiring classification. Examples of these methods applied to mathematics, natural sciences, physics and grammar instruction are given. (18 ref.) (C. M.)

9806. Tausch, Anne M. & Langer, Inghard. (L. Hamburg, Inst. of Psychology, W. Germany) **Merkmale des Erziehungsverhaltens von Müttern und Kindergärtnerinnen und Art der Änderung durch eine Fortbildungsveranstaltung.** [Characteristics of educational behavior in mothers and kindergarten teachers and type of change after an adult education course.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(4), 269-283. Investigated the educational style of 40 mothers and 65 kindergarten teachers social workers after they had taken an adult education course of 11 and 5 hr. respectively. Their styles were observed and recorded in 2 projective conflict situations. Mothers realized a lower level of disengagement and control towards children than their own education had done. The styles of kindergarten teachers were similar to those previously obtained in earlier investigations. The main dimensions of educational behavior in conflict situations are an emotional behavior dimension (regard-encouragement-social reversibility vs. the opposite) and controlling behavior. It was possible to modify the emotional behavior dimension of the kin-

dergarten teacher group towards higher levels of regard-encouragement-social reversibility after a 5-hr. educational course (English summary). *R. J. Higgins*

Teaching Methods & Teaching Aids

9808. Alderfer, Clayton P. & Lodahl, Thomas M. (Yale U.) **A quasi experiment on the use of experimental methods in the classroom.** *Journal of Applied Behavioral Science*, 1971(Feb), Vol. 7(1), 43-69. In a graduate school of business a quasi-experimental design was used to compare the changes in behavior and attitudes of 22 Ss in a training course with those of 24 Ss in a more traditional lecture course. Videotape viewing of the Ss' own behavior was employed in both courses, and the behavior and attitude changes resulting from this intervention were compared. Comparisons between the 2 courses indicated the following: Compared with the lecture course, the training group course showed more here-and-now behavior, more group dynamics, less organizational dynamics content, more movement, more perceived comfort with feelings and more perceived comfort in learning (p. 48-51). Videotape viewing resulted in changes toward more here-and-now behavior and satisfaction in both groups, and more movement and perceived transfer of learning in the training course group. (D. J.)

9809. Baesher, Richard H. **Discrimination training in the recognition of Spanish sounds.** *Journal of Experimental Psychology: Learning, Memory, and Cognition*, 1971, Vol. 7(1), 78-96. Ss were 48 high school freshmen divided into 4 Ss in a 12-hr Spanish course, a private high school Ss were matched with respect to age and sex, and a control group was given no Spanish instruction. The experimental group was given 12 hr of Spanish instruction. The given 12 hr of instruction was given in a controlled order. The control group was given a random order. The results showed that the Spanish test of sound recognition was significant. The results were administered to the Ss in a Spanish course. A significant difference was found between the Spanish course and the control group. (D. J.)

9813 Clark, D. Cecil. (U. Washington) Teaching concepts in the classroom: A set of teaching prescriptions derived from experimental research. *Journal of Experimental Psychology*, 1971(Jan), Vol. 81, No. 1, 25-38. Attempted to determine to what extent the large body of experimental research in concept attainment may be used to construct an empirically derived set of prescriptions for teaching various types of classroom concepts. From the results of experimental research in concept attainment over the past 10 yr, students were selected whose independent variables could be identified and placed into the following groups: (a) concept variables, (b) stimulus variables, (c) subject variables, and (d) task variables. Factors in the experimental context which may lower external validity are delineated. 4 examples of conceptual objectives found in the classroom, along with their operational evidence, are presented. A set of 11 statements about concept attainment and a set of teaching prescriptions suggested by these statements are formulated. Research from which each statement was derived, as well as research which failed to support that statement, are cited. (7 p. refs.) *Journal abstracts*.

9815 Dwyer, Francis M. (Pennsylvania State U., University Div. of Instructional Services) Effect of questions on visualized instruction. *Journal of Psychology*, 1971(Jul), Vol. 80(2), 181-183. Attempted to measure the effectiveness with which different types of visual illustrations complementing textual material facilitated S achievement of different learning objectives when questions designed to direct S attention to relevant learning cues followed each visual display. 22 college Ss were randomly assigned to 1 of 9 treatment groups. Each S received a pretest, participated in his respective visualized presentation, and received S individual criterion measures. Results indicate that when questions follow textual material and focus S attention on relevant learning cues, visualization of the content material is not an effective instructional technique for facilitating S achievement of all types of learning objectives. *Author abstract*.

9816 Dwyer, Francis M. (Pennsylvania State U., Div. of Instructional Services) Effect of questions on visual learning. *Perceptual & Motor Skills*, 1971(Feb), Vol. 30(1), 51-54. Measured the effectiveness with which different types of visual displays facilitated S's achievement of different learning objectives when these were used to complement oral instruction. 224 undergraduates were Ss. Questions preceded each display and were designed to direct S's attention to relevant learning cues. Each S received a pretest, participated in his respective visualized presentation, and received S individual criterion measures. Analyses indicate that (a) the use of questions to complement the more realistic visuals is not

an effective technique for improving S's achievement and (b) all types of visual displays are not equally effective in facilitating S's achievement of different learning objectives. *Journal abstracts*.

9820 Menduni, Enrico. La dinamica del corso programmato nelle sue fasi. [The dynamics of a programmed course in its phases.] *Bollettino di Psicologia Applicata*, 1970, No. 85-87, 125-147. Studied the operative principals of programmed instruction in Italy. Programming is defined as a technique that considers a given problem in all its visible aspects and tries to solve the problem in the most reasonable manner. The phases of programming instruction are studied: (a) work equipment, (b) selection of the course, (c) evaluation of the point of departure, (d) definition of the objectives, (e) definition of contents, (f) selection of the program, (g) construction of the elements, (h) experimentation in evaluation, and (i) final edition. The programmed course should be accompanied by a general introduction defining a programmed course, a specified introduction concerning information about Ss, and a guide for the learner. —A. M. Faraglia.

9821 Nikandrov, N. D. Programirovanie obucheni i idei kibernetiki. [Programmed instruction and cybernetic ideas.] USSR: Nauka, 1970. 92 p. —Describes the effect of cybernetics on the development of new theoretical and practical approaches in human instruction. Most of the ideas were concerned with programmed instruction. Theoretical principles underlying the creation of various programmed instruction methods and of systematically programmed materials were analyzed. Old classical instruction methods, the cybernetic pedagogy, and mathematical psychology are examined. 1. Hines.

9822 Richards, P. N. & Bolton, N. (Bath U. of Technology, School of Education, England) Type of mathematics teaching, mathematical ability and divergent thinking in junior school children. *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 32-37. Administered tests of intelligence, mathematical ability, divergent thinking, and attitudes toward school subjects to a sample of 265 children in their final yr. at 3 junior schools. The 3 groups were matched for social class, intelligence, and time devoted to mathematics teaching. The chief difference between them being that in School C mathematics was taught by a discovery approach and in School B by traditional methods, while in School A the staff aimed to "keep a balance" between the traditional and discovery methods. Factor analysis of the data reveals a large, general factor with high loadings for intelligence, mathematical and divergent ability tasks, and a 2nd factor of divergent thinking, on which a few of the mathematical tests loaded, but then only minimally.

A comparison of the 3 schools shows that, in general, the performance of School C on the mathematics tests was significantly below that of the other 2 schools, although Ss at School C tended to perform well on divergent thinking tests. There were some exceptions to this pattern.—*Journal abstract.*

9823. Sjöberg, Kristina & Tropé, Barbro. (Pedagogical & Psychological Inst., Malmö, Sweden) **The value of external direction and individual discovery in learning situations: The learning of a grammatical rule.** *Scandinavian Journal of Educational Research*, 1969, No. 4, 233-240.—45 pairs matched according to sex, line of study, and intelligence, were selected out of 4 6th grade classes. Group A was told a principle and allowed to practice it on a number of examples. Group B was given the practices only. It was found that Group A learned the principle better, and was also better as to transfer. On a test of retention 5 wk. later there were no longer any differences between the groups. It is suggested that different methods be tested at many levels of the school, since the effectiveness of the methods depends on the general stage of the pupils' development.—*Journal abstract.*

Germany) **Die Auswirkung verbesserter Textgestaltung auf Lesbarkeit, Verständlichkeit und Behalten.** [The effects of improved text arrangement and readability values, comprehension and retention.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(4), 257-268.—For testing the readability of a written text, 144 1st-yr high school students were presented with a textbook excerpt on statistical prob-

lems. 2 versions were used, 1 in the original wording, the other with simplified syntax and grouping. It was hypothesized that the modified version would be the simpler one to read in terms of comprehension. Results were highly significant, with a total of 42% of the variance accounted for by text improvement and recall. (English summary)—R. F. Wagner.

9831. Woods, Pat & Hartley, J. R. (Leeds U., England) **Some learning models for arithmetic tasks and their use in computer based learning.** *British Journal of Educational Psychology*, 1971(Feb), Vol. 41(1), 38-48.—Discusses the advantages in having a computer individualize instruction by generating teaching material when it is needed, at a level which suits a pupil's particular competence. This requires valid models of task difficulty. Such models and the experiments to validate them for practice tasks in arithmetic computation are described. Using criteria of probability of success and rate of working for each column of an addition task in vertical format, analyses of variance of experimental data reveal main effects of digit size and number of rows. Following a formal development of the model a least squares analysis derives a function which, for the experimental data, relates those variables to the criteria. These are used by the computer to generate examples so that a pupil works at any specified level of success. Methods of implementation and decision making together with some preliminary results are given. These are extended by describing an experiment with subtraction tasks in which 2 competing models were used to describe the success and working levels of 24 7-yr-old children. These analyses and experiments show the complexity of the decision making which is needed for adaptive teaching and which exploit the computer's capabilities.—*Journal abstract*

PERSONNEL & INDUSTRIAL PSYCHOLOGY

9832. Burš, Z. (Charles U., Inst. of Psychology, Prague, Czechoslovakia) **Metodologické problémy správné formulace úkolů v aplikované psychologii.** [Methodological problems of correct formulation of tasks in applied psychology.] *Psychologie v Ekonomické Práci*, 1969, No. 2, 67-79.—Discusses the cooperative relationship between industrial managers and psychologists. The formulation of the psychological task is considered essential to their mutual relations. The tasks considered essential to their mutual relations are defined as (a) consultation of the industrial psychologist, (b) short-term consultation or short-term specialized reports, (c) short-term analysis, (d) applied research, (e) special basic research, and (f) theoretical research. Various other tasks are considered in view of their complexity, methodology, homogeneity, and psychological theory. Content analysis of individual tasks and their organizational management in industrial programs are discussed. The preparation of applied tasks is emphasized. Instructions for industrial managers in allocating work to industrial psychologists or special psychological institutes are presented (Russian & German summaries). English summary.

9837. Mendirabal Oses, Luis. (Inst. of Political Studies, Youth Inst., Madrid, Spain) Situación de los jóvenes ante el trabajo. Indagación crítica sobre la singular condición del joven, sujeto de derechos y deberes en la relación laboral. [The position of youth in relation to work. Critical investigation on the singular condition of youth as the subject of rights and duties in work relations.] *Revista del Instituto de la Juventud*, 1970(Dec), Vol. 12, 88-106. —Critically evaluates the position of 14-18 yr olds in labor relations in Spain. Suggestions are offered which would benefit the development of the young in the working force and the nation as well. The need to prevent children under 14 yr from working, particularly in rural areas, is stressed. Contracts for apprentices which impose more duties than rights for the minor are studied. A new contract is proposed where the S should be at least 16 yr old. In Spain, where productive expansion is being sought in all sections, it is imperative to be conscious of the problems which confront the young by updating and modifying laws regarding the young in the labor force.—J. M. Farleyman.

VOCATIONAL CHOICE & GUIDANCE

SELECTION & PLACEMENT

9841. Ambler, Rosalie K. & Guedry, Fred F. Reliability and validity of the Brief Vestibular Disorientation Test compared under 10-rpm and 15-rpm conditions. *USN AMRL Army-Navy Joint Report*, 1970(Aug), No. 1115, 9 p. Determined if reliability, validity, and augmentation of correlation could be obtained with less disturbance to the S than that caused by the 15-rpm speed of rotation used thus far in the Brief Vestibular Disorientation Test (BVDI). Reduced disturbance and aftereffects are desired because the BVDI is now envisioned as becoming part of the entering flight physical. It is suggested that procedures that might either

minimize performance on the other tests or require retests be used be used to a minimum. The BVDI procedure used here was identical to 2 previous studies except a 15-rpm program was used instead of 15-rpm. Subjects were 150 military aviators who were tested within the 1st 4 weeks of training. Retesting of 72 of the Ss was conducted 1 wk later. The test-retest and rater reliability coefficients were not quite so high as for those who had the 10-rpm procedure, but they were of acceptable magnitude. The validity coefficients were approximately the same as those obtained for 15-rpm, and significant differences of the existing selection battery and BVDI was demonstrated. It is concluded that the 10-rpm BVDI was a feasible procedure. It is also concluded that because the mean score for the 10-rpm group was lower than the mean for either of the 15-rpm groups used previously, S disturbance was reduced.—Author abstract.

9842. Carlson, Robert E., Thayer, Paul W., Maifred, Eugene C., & Peterson, Donald A. (Life Insurance Agency Management Assn., Hartford, Conn.) Improvements in the selection interview. *Personnel Journal*, 1971(Apr), Vol. 50(4), 268-275, 317. Studies of interview programs were conducted by the Life Insurance Agency Management Association for the purpose of improving agency selection interviews. An Agency Selection Kit was developed which shows many promising as an improved interview procedure.—P. L. Connelley.

9843. Michaelis, W. & Eysenck, H. J. (U. London, Inst. of Psychology, England) The determination of personality inventory factor patterns and intercorrelations by changes in real-life motivation. *Journal of General Psychology*, 1971(Jun), Vol. 118(2), 223-234. —A personality inventory containing scales for Neuroticism (N), Extraversion (E), Psychoticism (P), and Lie (L) was administered to 339 applicants for a much sought-after training course for industrial apprentices (high-motivation group) as part of the selection test and to 225 similar apprentices already accepted (low-motivation group). The high-motivation group had higher scores on the I scale, and lower scores on the N and P scales, as predicted. Factor analyses of the intercorrelations between the items showed that similar factors (N, E, P, and L) emerged from both groups but that the I scale accounted for more of the variance in the high-motivation group, while the personality scales accounted for more of the variance in the low-motivation group. Motivation increased the correlation (negative) between I and N, and the data suggest that the I scale might with advantage be used as an empirical correction device particularly in employment and selection situations. (21 ref.)—Author abstract.

9844. Raubenheimer, I. & Tiffin, Joseph. (U. South Africa, Pretoria) Personnel selection and the prediction of error. *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 229-233. Summarizes a few trends in current personnel selection research and presents the rationale for a prediction model, taking advantage of the concept of under- and overpredictability. A noncognitive predictor of predictability was developed, using 224 male and female clerical workers, and used to subgroup a cross-validation sample of 110 Ss into underpredictables, accurately predictables, and overpredictables. Product-moment correlations between the unweighted sum of 6 cognitive predictors (subtests on the Purdue Clerical Adaptability Test) and a criterion measure of overall job

performance were .26, .48, and .40 for the 3 subgroups, respectively. This compared favorably with a correlation of .25 before subgrouping and .34 for the 6 cognitive predictors and 2 noncognitive predictor scales (used to develop the predictor of predictability). (15 ref.)—*Journal abstract.*

TASK & WORK ANALYSIS

9851. Aume, Nilss M. **Estimation of target locations with conventional measurement units.** *USAF AMRL Technical Report*, 1969(Sep), No. 69-21, 33 p.—Studied human ability to estimate lateral distances

from an identified point in 3 experiments, 2 carried out indoors on table-top visual ranges, and 1 conducted outdoors on a landing field. Reference markers were placed on these ranges. Ss pointed a simple aiming device at various points which they estimated to be a required distance (specified by the E) laterally away from the reference markers. The major conclusions are (a) lateral distance estimates are inaccurate, responses range from 25-500% of the required distances, (b) certain factors influence performance, i.e., the magnitude of the response tends to be proportional to the required distance, feedback reduces variability, and background features have varied influences, and (c) estimation of distances in terms of ratios to given reference distances should be studied, because there appears to be a potential for improvements. *Journal abstract.*

Integraciji. [Comparative analysis of the workers' attitudes to fusion of enterprises] *Psichologija*, 1969, 1970(Oct), Vol. 3(1), 111-121. Compared 760 workers' attitudes to fusions in 3 metal-processing companies. Emphasis was placed on the following: (a) workers' attitudes to fusions as a socioeconomic phenomenon, (b) attitudes to the fusions in which the given companies were about to take part; and (c) the workers' estimate of, and satisfaction with, the existing situation in the company. Results show that the workers' attitudes are positive both to fusion in general and to fusion in which each respective company was to take part. However, a tendency was noted for workers from companies of different strength to react to the fusion differently. Weaker companies were quicker to decide in favor of the fusion. There was a resistance in companies of sounder economic standing to fusion with weaker companies. It was also demonstrated that, in the opinion of the workers, there are certain groups which most frequently resist fusion. Workers were dissatisfied with the management, organization, and incomes in their companies, and probably expected the new company, following the fusion, to be managed more adequately and that incomes would be higher. Consequently, a large percentage of the workers were in favor of the fusion. (Russian summary) — *English summary*.

9858. **Hackman, J. Richard & Lawler, Edward E.** (Yale U.) **Employee reactions to job characteristics.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 259-286. Developed and tested a conceptual framework specifying the conditions under which jobs will facilitate the development of internal motivation for effective performance. Ss were 62 supervisors and 208 telephone company employees who worked on 13 different jobs. Primary independent variables were (a) a measure of strength of desire for the satisfaction of higher order needs (e.g., obtaining feelings of accomplishment, personal growth); and (b) descriptions of jobs on 4 core dimensions (variety, autonomy, task identity, feedback). It was predicted and found that when jobs are high on the 4 core dimensions, employees who are desirous of higher order need satisfaction tend to have high motivation, have high job satisfaction, be absent from work infrequently, and be rated by supervisors as doing high quality work. A number of supplementary analyses are reported. (48 ref.)—*Journal abstract*.

9859. **Hrnjica, Sulejman.** **Uticaj nekih tipova zadovoljstva (sobom, staršinom i kolektivom) na stav prema armiji.** [Influence of certain types of satisfaction (with oneself, with the direct superior, and with the given collectivity) on the attitude to the army.] *Psichologija*, 1969-1970(Oct), Vol. 3(1), 15-24. —Verified the supposition that there exists a significant influence of various types of dissatisfaction on social attitudes, irrespective of the possible connection between the source of dissatisfaction and the object toward which an attitude is formed. 355 cadets of the Yugoslav People's Army Reserve Officers Academy, all college graduates, were Ss. Their attitude to the Army was measured by a Likert-type scale. Satisfaction with oneself, one's superior, and the collectivity was estimated by answers given to a standardized questionnaire. This was followed by an estimate of the satisfaction as a whole, for each type. The individual combination of satisfactions served as the criterion for the placing of Ss into groups. Differences between the groups were established on the basis of the scores obtained by means of the scale for measuring the

degree of positiveness of the attitude to the army. Results show that there is a significant influence of various types of satisfaction on the degree of positiveness of the attitude to the army, so that the supposition of the influence of various types of satisfaction on social attitudes was confirmed. Satisfaction with one's superior had the most marked influence on the degree of positiveness of the investigated attitude. Certain forms of satisfaction with oneself were believed to influence the degree of positiveness of the attitude in question. It is shown that satisfaction with the collectivity was not without influence on the degree of positiveness of the attitude to the army, but its influence was on the border of statistical significance. (Russian summary)—*English summary*.

9860. **Huber, George P., Daneshgar, Rahman, & Ford, David L.** (U. Wisconsin, Social Systems Research Center.) **An empirical comparison of five utility models for predicting job preferences.** *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 267-282. —Studied the validity of several utility models as predictors of job choices and job ratings. Ss were 4 experienced and 15 inexperienced persons seeking professional employment in the public schools. The utility models differed in form and in scaling methods used in their construction. Job choices were used to determine and compare the validity of the models. With respect to the validity as predictors of job choices, it appeared that a 2-stage rating model was generally superior. Job ratings were also used to determine the validity of the models and to test several hypotheses concerning their validity relative to one another. (18 ref.)—*Journal abstract*.

9861. **Hulin, Charles L. & Waters, L. K.** (U. Illinois.) **Regression analysis of three variations of the two-factor theory of job satisfaction.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 21-27. —Tested 3 distinct variations of the 2-factor theory by reanalyzing data previously published by L. Waters and C. Waters (see PA, Vol. 44:1432). No support for any of these 3 frequently assumed versions was found. Results of this and several prior studies are explained by assuming the existence of 2 main effects: (a) intrinsic job factors are generally more potent for predicting overall job attitudes, and (b) overall job satisfaction is more predictable than overall job dissatisfaction. Neither effect requires the assumptions of the discontinuity of satisfaction and dissatisfaction or the assumptions of dimensional differences between intrinsic and extrinsic job factors.—*Journal abstract*.

9862. **Korman, Abraham K.** (New York U., Ed.) **Expectancies as determinants of performance.** *Journal of Applied Psychology*, 1971(Jun), Vol. 55(3), 219-222. —Reports 5 studies which support the general proposition that high expectancies of competence in others are positively related to performance. 2 of the studies involved laboratory research with 300 under graduates where the expectancies emanated from peers. The other 3 involved field research with 87 employees. The different types of working situations where the expectancies were those of organizational leadership vis-à-vis subordinate performance. Intelligence and environmental variables were not moderators of the obtained relationship.—*Journal abstract*.

9863. **Malotinová, M.** (Charles U., Inst. of Psychology, Prague, Czechoslovakia) **Posuzovací škály zakotvené v příkladech očekávaného chování.** [Rating

power and subordinate job satisfactions. *Canadian Journal of Behavioural Science*, 1971(Apr), Vol. 3(2), 183-193.—Related 5 bases of supervisory power (coercive, expert, legitimate, referent, and reward) proposed by J. R. French and B. Raven to a survey of subordinate satisfaction (a) company, (b) job, (c) supervisor, and (d) climate for growth in performance, learning, and (e) climate for growth in day-to-day interaction with supervisor. 58 were 523 employees of a large public utility company who answered a questionnaire survey. Expert power was the most common, followed by legitimate, coercive, referent, and reward. Generally, referent and expert powers were associated with greater satisfaction, legitimate power was intermediate, reward and coercive powers were associated with least satisfaction. The 2 clearest reversals were meaningful when the unique aspects of satisfaction were considered. Also, the most (and least) effective bases of power were perceived as being used together. Comparison with other published research reveals few population differences in prevalence of various types of power. (French summary.)—*Journal abstract*

9876 DeVries, David L., & Jahromsky, Stephen F. (Johns Hopkins U.). *Applying operant conditioning principles to the management of organizations*. *Center for Social Organization of Schools, Report, Johns Hopkins U.*, 1971(May), No. 102, 28 p.—Expands W. Nerd's predictive model of individual behavior based on both operant conditioning and management literatures. The behavior of an organizational member is seen as a function of the reinforcement contingencies applied by various groups in his environment and of his cognitive assessment of such contingencies. Several characteristics of reinforcement contingencies are examined, e.g., positive vs. negative reinforcement, schedules of reinforcement, and immediacy of reinforcement. It is suggested that the model may provide a potentially useful schema for classifying environmental contingencies operating on a member of an organization and for predicting their varied effects on behavior. (28 ref.)—*Journal abstract*

9877 Fink, Stephen L., Beak, Joel, & Tadden, Kenneth. (U. New Hampshire, Whittemore School of Business & Economics). *Organizational crisis and change*. *Journal of Applied Behavioral Science*, 1971(Jan), Vol. 7(1), 15-41.—4 stages of a model of human adaptation to crisis—shock, defensive retreat, acknowledgement, and adaptation and change—are extended to explain organizational behavior under crisis. Known concepts of individual, group, and organizational behavior are related to the model and implications for organizational consultants are discussed. A comment by L. Solomon and N. Paris follows. 9882 Schultz, Andrew F. (U. Illinois, Coll. of Business Administration, Chicago Circle). *Values and work systems: importance and relationship to management and organizational behavior*. *Journal of Psychology*, 1971(Jul), Vol. 8(2), 277-286.—Reports the value analysis approach to explain motivated behavior. It is argued that the value theory approach to behavior is more equally or more insightful than the more popular theories which are either conceptually too narrow. In addition, an explanation is provided of how value analysis can be used to study not only individual behavior, but group and organizational behavior as well. Increased recognition of the applications of value theory will be forthcoming. The value research which has been enhanced by the development of new value measuring devices. (ref.)—*Author abstract*

9883 Taylor, James C. (U. Michigan, Inst. for Social Research). *An empirical examination of a four-factor theory of leadership using smallest space analysis*. *Organizational Behavior & Human Performance*, 1971(May), Vol. 6(3), 249-266.—Studied the integrative 4-factor theory of leadership proposed by G. Bowers and S. I. Seashore (see PA, Vol. 41, 873, 1970) in the empirical clustering of variables type used to measure the factors. 13 supervisory type questionnaire variables and 11 work group leader variables were examined for geometric proximity clustering using smallest space analysis. Data obtained from 3 industrial organizations, a petroleum refinery, insurance company, and a plastics producer (n = 99, and 54) are examined separately, with the refined data reviewed in considerable detail. Results suggest that the 4 factors originally postulated exist as separate, measurable entities with slight exceptions. Some modifications of the original factors seem necessary based on consistent differences across the 3 sites examined. Several differences among the sites are noted.—*Journal abstract*

9884 Wager, L. Wesley. (U. Washington). *The expansion of organizational authority and conditions affecting its denial*. *Sociometry*, 1971(Mar), Vol. 34(1), 91-113.—Investigated the opposition organizational actors experience from diverse occupational status groups when they attempt to expand their accepted sphere of influence into nonwork spheres, the context of potential corporate infringement. The relative importance of 5 variables were studied: (a) type of the appeal, (b) channel of communication, (c) status behavior requested, (d) company stand, and (e) status group. Utilizing hypothetical situations for 2 different types of voting-related issues, the reactions of 760 blue collar, white collar, engineering, and managerial employees were assessed. While status differentiated employees responded similarly, the magnitude of opposition and latent protest ranged from 10-90% depending upon which mode of expanding authority was employed. Contrasting states of the form of appeal and channel of communication generated the greatest change in opposition to the authority expansion attempts. (23 ref.)—*Journal abstract*

SPECIAL ENVIRONMENTS

9886. Smith, Paul F., Howard, Robert; Harris, Martin, & Waterman, Day. Underwater hearing in man: II. A comparison of temporary threshold shifts induced by 3500 Hertz tones in air and underwater. *U.S. Naval Submarine Medical Center Report*, 1970(Jan), No. 608, 4 p.—Explored the upper limits of useful hearing by underwater swimmers. 6 men were subjected to 3,500 Hz. pure tones of 1250-msec pulse length repeated every 2.5 sec. for a 15-min period at SPLs of 168 and 178 db. re .0002 dynes/square cm. Temporary threshold shifts were measured and compared to temporary threshold shifts induced by similar exposures at lower levels in air in a 2nd group of 5 men. It was found that the SPL of 3500 Hz. tones in water must be about 68 db. higher than tones in air in order to induce comparable magnitudes of temporary threshold shifts.—*Journal abstract*.

ADVERTISING & CONSUMER PSYCHOLOGY

9887. Bennett, Peter D. & Mandell, Robert M. (Pennsylvania State U.) Prepurchase information seeking behavior of new car purchasers: The learning hypothesis. *Journal of Marketing Research*, 1969(Nov), Vol. 6(4), 430-433.—146 car purchase case histories were analyzed according to sources of information and information seeking as a function of number of prior purchases, number of prior purchases of brand just purchased, and number of sequential prior purchases of brand just purchased. 2 hypotheses were supported—"as the total number of reinforced purchases of a brand increases... as the number of sequential reinforced purchases increases" the amount of information seeking will decrease before purchase of that brand. J. C. Franklin.

9888. Bither, Stewart W., Dolich, Ira J., & Nell, Elaine B. (Pennsylvania State U.) The application of attitude immunization techniques in marketing. *Journal of Marketing Research*, 1971(Feb), Vol. 8(1), 56-61. Student attitude changes on a controversial issue were measured as subject to immunization, source, and attack experimental conditions. Some commercial application is inferred from the findings but the conclusions "must be labeled as tentative."—J. C. Franklin.

9889. Blake, Brian; Perloff, Robert, & Heslin, Richard. (St. John's U., Jamaica, N.Y.) Dogmatism and acceptance of new products. *Journal of Marketing Research*, 1970(Nov), Vol. 7(4), 483-486.—Male college students' experimental reactions indicate that "consumers' tolerance for ambiguity may be negatively related to acceptance of novel products, but may be unrelated to the acceptance of recent products" and "it may mediate the relationship between consumer innovation and the presence of a group norm prescribing new product acceptance; such a norm may be more effective for a sample of high-recency products than a sample of high-novelty ones."—J. C. Franklin.

9890. Britt, Stuart H. (Ed.) (Northwestern U. Graduate School of Management) *Psychological ex-*

periments in consumer behavior. New York, N.Y.: John Wiley, 1970. xv, 416 p. \$6.95 (paper).

9891. Cohen, Joel B. & Goldberg, Marvin E. (Illinois) The dissonance model in post-decision product evaluation. *Journal of Marketing Research*, 1970(Aug), Vol. 7(3), 315-321. "Decision, immediate post-decision, non-consumption and postconsumption" measurements were made in an experiment involving instant coffee and college students. It was found that the "amount of dissonance was an important source of influence only as it interacted with brand selected" thus "leading to the belief that differential prior information... must be taken into account in predicting the kind of cognitive reevaluation that will take place."—J. C. Franklin.

9892. Fry, Joseph N. & Siller, Frederick H. (Western Ontario, London, Canada) A comparison of housewife decision making in two social classes. *Journal of Marketing Research*, 1970(Aug), Vol. 7(3), 333-337. "Comparison of the search, brand preferred and deal sensitivity measures for the 2 social classes (working and middle) revealed a fairly high degree of similarity in observed behavior in the shopping simulation. However, differences found between the class groups in the sign and/or magnitude of variables related to observed behavior imply variation by social class in the nature of the decision-making process."—J. C. Franklin.

9893. Green, Paul E. & Rao, Vithala R. (Pennsylvania) Multidimensional scaling and individual differences. *Journal of Marketing Research*, 1971(1st), Vol. 8(1), 71-77. Using "synthetic data analysis" the performance of 5 different methods are compared for scaling averaged dissimilarities data under conditions involving individual differences in "perception." All methods perform well when no "degradation" of the (simulated) ratings is entailed. J. C. Franklin.

9894. Hamm, B. Curtis & Cundiff, Edward W. (Oklahoma State U.) Self-actualization and product perception. *Journal of Marketing Research*, 1969(Nov), Vol. 6(4), 470-472. Through the use of sorts, certain relationships between measurements of self-actualization and perceptions of products were found. These are reported and discussed. J. C. Franklin.

9895. Hawkins, Del. (Southern Illinois U.) The effects of subliminal stimulation on drive level and brand preference. *Journal of Marketing Research*, 1970(Aug), Vol. 7(3), 322-326. Reviewed the concepts associated with subliminal research, and tested a theoretical explanation of subliminal effects. "Basic drive arousal was predicted and achieved but attempts to form subliminal associations with behavioral consequences proved futile."—J. C. Franklin.

9896. Kollat, David I., Engel, James F., & Blackwell, Roger D. (Ohio State U.) Current problems in consumer behavior research. *Journal of Marketing Research*, 1970(Aug), Vol. 7(3), 327-332. Discusses problems "attributable to the complexity and inflexibility of consumer research." If they are "resolved or even some significant progress toward their solution is made, a significant stride will be taken toward the development of a consumer research tradition."—J. C. Franklin.

9897. Mittelstaedt, Robert. (U. Missouri) A dissonance approach to repeat purchasing behavior. *Journal of Marketing Research*, 1969(Nov), Vol. 6(4), 444-446. In a laboratory study of swim suit choices by male business school students, choice decisions tended to

be made in accordance with the view that "brand loyalty is a function of the dissonance experienced at time of purchase." *J. C. Franklin*

9898. Sparks, David L. & Tucker, W. T. (U. Richmond) **A multivariate analysis of personality and product use.** *Journal of Marketing Research*, 1971 (Feb), Vol. 8(1), 67-70. The results of correlational, then canonical analyses of personality traits and product-use data show that the "association of identical personality traits (within different sets of personality traits) with diverse consumer behavior suggests that trait interactions or non-linear relationships may compose a significant portion of the personality-behavior relation." Moreover, "the apparent lack of correlation among product-use patterns suggested by factor analysis... leads to the conclusion that a general model applicable to all consumer behavior would prove extremely complex." *J. C. Franklin*

BRIEF SUBJECT INDEX

Brain Disorder
9002, 9235, 9286, 9465, 9466, 9478, 9590, 9633, 9635

Brain Injury (SEE Brain Damage)

Brain Lesion (see also Brain Lesion-Animal)
9405, 9472, 9479

Brain Lesion-Animal (see also Rat/Lesions in, Cat/Lesions in)
8215, 8244, 8247, 8248, 8254, 8257, 8260, 8264, 8268, 8269

Brain Stimulation (see also Rat/Brain Stimulation in)
8215, 8281, 8286, 8288, 8289, 8290, 8291, 8292, 8294, 8296, 8298, 8299, 8301, 8304, 8305, 8306, 8307, 8308, 8309

Breeding (SEE Genetics)

Brightness (see also Light)

8048, 8067, 8068, 8285, 8378, 8418, 8579, 8640, 8643, 8644, 8646

Britain (SEE Great Britain)

Broken Home (SEE Family, Marital Problems)

Business
7989, 8861, 8950, 9808, 9833, 9854, 9856

California Psychological Inventory (SEE Test/Personality)

Canada

8826, 9076

Cancer (SEE Disease)

Capital Punishment (SEE Law, Crime & Criminals)

Cardiovascular Disorders

8408, 9504

Cardiovascular Processes (see also Blood, Blood-Animal, Blood Pressure, Heart, Heart Rate)

8264, 8458, 8475, 8476

Career (SEE Occupation)

Career Choice (SEE Occupational Choice)

Case Report

8412, 8761, 9128, 9330, 9335, 9357, 9368, 9374, 9401, 9402, 9404, 9405, 9406, 9408, 9409, 9410, 9488

Case Report-Treatment

9141, 9147, 9158, 9207, 9218, 9222, 9268, 9370, 9372, 9403, 9407, 9411, 9412, 9439, 9504

Casework (SEE Social Casework)

Castration (SEE Personality, Sex, Sexual Behavior)

Cat

7944, 8215, 8222, 8286, 8288, 8289, 8290, 8291, 8292, 8294, 8296, 8304, 8306, 8308, 8309, 8319, 8320, 8323, 8326, 8331, 8345, 8352, 8356, 8357, 8362, 8373, 8377, 8391, 8440, 8635, 8642

Cat/Drug Effects in

8377, 8415, 8444, 8447, 8448, 8450, 8462, 8467

Cat/Learning in

8258, 8272, 8296, 8514

Cat/Lesions in

8243, 8246, 8249, 8258, 8272, 8337

Catalepsy (SEE Mental Disorder, Neurosis, Psychosis)

Categorical Behavior

8105, 8129, 8146, 8147, 8152, 8157, 8177, 8183, 8963, 9000, 9621, 9742

Catharsis (SEE Therapeutic Process)

Cathexis (SEE Affect, Psychoanalytic Theory)

Catholicism (SEE Religion)

Census Studies (SEE Population Characteristics)

Central Nervous System (SEE Nervous System/Central)

Cerebral Cortex (see also Visual Cortex)

8153, 8212, 8237, 8246, 8262, 8265, 8267, 8268, 8272, 8273, 8283, 8286, 8288, 8296, 8301, 8304, 8309, 8311, 8319, 8321, 8323, 8330, 8337, 8342, 8348, 8352, 8359, 8363, 8365, 8372, 8373, 8391, 8415, 8429, 8448, 8450, 8462, 8476, 9329, 9405, 9466, 9479

Cerebral Dominance (SEE Cerebral Cortex, Laterality)

Cerebral Palsy (SEE Physical Handicap, Nervous System/Disorder of)

Cerebral Thrombosis (SEE Brain Disorder, Cardiovascular Disorders)

Cerebrovascular Disorder (SEE Brain Disorder, Cardiovascular Disorders)

Certainty (see also Probability)
8095, 8168, 8656, 8934, 9309, 9572

Character (SEE Personality, Ethics)

Character Disorder (see also Emotional Disturbance)

Cheating (SEE Deception)

Check List (SEE Inventory)

Chicken

8432, 8455, 8460, 8533

Child Abuse

9298

Child Guidance (SEE Psychotherapy/Children, Guidance/Educational)

Child Psychiatry (see also Psychotherapy/Children, Schizophrenia/Childhood, Childhood/Personality in)
7927, 9095, 9105, 9117, 9272

Child Rearing (see also Parent-Child Relations)
8778, 8854, 9107, 9450, 9552

Childhood & Children (see also next headings, Gifted, Student/Elementary School, Language Development, Mental Retardation)
8346, 8656, 8658, 8686, 8693, 8700, 8760, 8825, 9242, 9306, 9351, 9429, 9458, 9471, 9476, 9521, 9636

Childhood/Ability in

8671, 8691, 8706, 8724, 8737, 8740, 8741, 8742, 8743, 8744, 8745, 8746, 8747, 8748, 8750, 8751, 8754, 8850, 9475, 9546, 9620, 9718, 9724, 9786, 9822

Childhood/Behavior Problems in
9091, 9238, 9247, 9347, 9463, 9478, 9529, 9588, 9594, 9646, 9704, 9708

Childhood/Concepts & Problem Solving in
8666, 8672, 8673, 8682, 8684, 8689, 8695, 8697, 8702, 8703, 8707, 8714, 8722, 8723, 8726, 8727, 8728, 8729, 8730, 8732, 8734, 8736, 8737, 8738, 8739, 9352, 9360, 9625, 9743, 9804, 9813

Childhood/Development in (see also Age Differences-Children)

8657, 8668, 8673, 8675, 8678, 8689, 8691, 8695, 8696, 8699, 8706, 8714, 8717, 8724, 8733, 8736, 8737, 8758, 8766, 8776, 8790, 8793, 8847, 9248, 9403, 9439, 9541, 9576, 9635, 9637

Childhood/Disadvantaged (see also Socioeconomic Status)

8663, 8685, 8740, 8742, 8751, 8758, 8991, 9138, 9229, 9583, 9589, 9593, 9602, 9653, 9688, 9690, 9771, 9785, 9786, 9790, 9819

Childhood/Emotional Disturbances in

9088, 9107, 9138, 9153, 9248, 9276, 9277, 9291, 9347, 9352, 9360, 9518, 9588, 9646, 9647, 9648, 9649

Childhood/Family Relations in (SEE Parent-Child Relations, Family Relations)

Childhood/Gifted (SEE Gifted)

Childhood/Handicapped

8759, 9088, 9103, 9107, 9180, 9446, 9449, 9450, 9451, 9455, 9457, 9591, 9605, 9607, 9608, 9610, 9611, 9612, 9614, 9615, 9617, 9618, 9619, 9622

Childhood/Hyperactivity in (SEE Childhood/Behavior Problems in)

Childhood/Learning in (see also Achievement/Academic-Elementary School, Student/Elementary School, School Learning)
8001, 8654, 8655, 8659, 8661, 8702, 8703, 8704, 8705, 8706, 8707, 8708, 8709, 8710, 8711, 8712, 8713, 8714, 8715, 8716, 8717, 8718, 8719, 8720, 8721, 8727, 8741, 8778, 8790, 9090, 9526, 9589, 9599, 9623, 9627, 9639, 9743, 9804, 9814

Childhood/Mental Retardation in (SEE Mental Retardation)

Childhood/Perception in
8653, 8664, 8683, 8684, 8699, 8717, 8724, 8732, 8749, 8752, 8753, 8754, 8755, 9103, 9352, 9589, 9603, 9640, 9725, 9743, 9759,

9800, 9814

Childhood/Personality in

8663, 8668, 8682, 8686, 8719, 8756, 8757, 8759, 8760, 8761, 8762, 8776, 8781, 8783, 8790, 9277, 9366, 9526, 9552, 9599, 9610, 9639, 9680, 9718, 9760, 9762, 9763, 9798

Childhood/Physical Illness in

9252, 9500

Childhood/Play in (SEE Childhood/Social Behavior in)

Childhood/Preschool

8692, 8695, 8697, 8698, 8701, 8708, 8715, 8717, 8725, 8726, 8732, 8740, 8744, 8746, 8749, 8750, 8758, 8763, 8769, 8771, 8774, 8781, 9574, 9576, 9583, 9585, 9680, 9731, 9751, 9785, 9786, 9797, 9798, 9802, 9814, 9825, 9826

Childhood/Personality in

9368

Childhood/Psychotherapy (SEE Psychotherapy/Children)

Childhood/Retarded (SEE Mental Retardation)

Childhood/Schizophrenia in (SEE Schizophrenia/Childhood)

Childhood/Social Behavior in

8687, 8691, 8705, 8763, 8764, 8765, 8766, 8767, 8768, 8769, 8770, 8771, 8772, 8773, 8774, 8775, 8826, 9526, 9653, 9670

Chlordiazepoxide (SEE Tranquilizer)

Chlorpromazine

8427, 8452, 8468, 8471, 9489

Choice Behavior (see also Decision Making, Learning/Probability)

8121, 8124, 8195, 8197, 8198, 8199, 8576, 8698, 8709, 8720, 8794, 8828, 8937, 8972, 9046, 9897

Chromosome (SEE Genetics)

City (SEE Urban & Suburban Environment)

Civil Rights (SEE Social Movements, Integration, Law)

Class (SEE Social Structure, Socioeconomic Status)

Classical Conditioning (SEE Conditioning/Classical)

Classification (see also Selection, Categorical Behavior)

8739, 9276, 9288, 9319, 9536, 9632

Classroom (see also Education, School, Teaching)

9525, 9584, 9600, 9654, 9692, 9700, 9805,

9813, 9818

Cleft Lip & Palate (SEE Speech/Defective)

Clergy (SEE Religion)

Clinic-Centered Therapy (SEE Psychotherapy/Methods in)

Climate (SEE Environment, Temperature)

Clinic (see also Community Services, Hospital, Treatment/Outpatient)

9245, 9249, 9516, 9521

Clinical Judgment (see also Psychodiagnostics)

9115, 9282, 9291, 9293, 9414, 9706, 9773

Clinical Psychology

7926, 8805, 9086, 9101, 9126

Cluster Analysis (SEE Factor Analysis, Statistics)

Coalition Formation (SEE Group/Small)

Cochlea (SEE Ear)

Coding (SEE Categorical Behavior, Problem Solving, Display)

Cognition (see also Thinking, Categorical Behavior)

8011, 8019, 8129, 8136, 8140, 8141, 8180, 8185, 8191, 8496, 8678, 8699, 8742, 8743, 8790, 8800, 8949, 9116, 9211, 9331, 9473, 9526, 9566, 9584, 9643, 9721, 9730, 9740, 9754, 9804

Cognitive Dissonance (SEE Attitude Change, Dissonance)

Cognitive Style

8731, 8878, 8897, 8914, 9000, 9065, 9372, 9732, 9749, 9762

Colitis (SEE Sexual Behavior, Sexual Behavior-Animal)

Cold (SEE Temperature)

College (see also Education, School, Student/College)

BRIEF SUBJECT INDEX

Delinquency/Juvenile (see also Antisocial Behavior, Crime & Criminals)
8790, 9297, 9315, 9316, 9317, 9318, 9319, 9320, 9321, 9322, 9323, 9324, 9325, 9326, 9333, 9416, 9628

Delirium (SEE Mental Disorder, Neurosis, Psychosis)

Delusion (SEE Mental Disorder, Neurosis, Psychosis)

Demographic Variables (SEE Population Characteristics)

Denial (SEE Defense Mechanism)

Dependency
8165, 8410, 8728, 8854, 9048, 9049, 9065, 9097, 9143, 9441, 9762, 9800, 9881

Depression (see also Emotion, Emotional Disturbance)
8098, 9039, 9077, 9149, 9232, 9234, 9236, 9237, 9239, 9241, 9246, 9340, 9354, 9355, 9356, 9357, 9359, 9361, 9363, 9370, 9371, 9406, 9409

Deprivation (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat/Deprivation in)
8203, 8297, 8484, 8530, 8539, 8546, 8716, 8795, 8864, 8917, 9490

Deprivation/Sensory
8088, 8102

Depth Perception (SEE Perception/Depth)

Desegregation (SEE Integration)

Desensitization Therapy (SEE Behavior Therapy)

Detection
8017, 8035, 8037, 8042, 8071, 8075, 8077, 8081, 8108, 8133, 8197, 8205, 8354, 8409, 8420, 8638, 9453

Developing Countries (SEE Cultures & Countries)

Development (see also Childhood/Development in, Language Development, Maturation)
8233, 8256, 8499, 8502, 8657, 8662, 8816, 8995, 9025, 9026, 9058, 9065, 9069, 9100, 9264, 9338, 9672

Dexterity (SEE Hand, Motor Performance)

Diabetes (SEE Blood, Disease)

Diagnosis (see also Psychodiagnosis, Schizophrenia/Diagnosis of, Mental Retardation/Diagnosis of)
7970, 7971, 7974, 9229, 9286, 9476, 9633, 9640

Diagnosis/Differential
9289, 9292, 9296, 9523

Dial (SEE Display)

Diet (SEE Food)

Differential Reinforcement at Low Rates of Responding (SEE Reinforcement Schedule)

Digestive System (see also Metabolism)
8202, 8209, 8210, 8279, 8500, 8501, 9236

Dign (SEE Number)

Disability (SEE Physical Handicap)

Disarmament (SEE War, International Relations)

Discrimination (see also Auditory Discrimination, Learning/Discrimination, Visual Discrimination, Rat/Discrimination in)
7991, 8016, 8197, 8639, 8698, 8717, 8720, 9347, 9566, 9809

Discrimination Learning (SEE Learning/Discrimination)

Discrimination Reversal
8238

Discrimination/Racial (SEE Integration, Prejudice, Social Movements)

Disease (see also Illness)
8263, 9374, 9407, 9412, 9497, 9498, 9501, 9502, 9522

Displacement (SEE Defense Mechanism)

Display (see also Control)
7982, 8008, 8009, 8010, 8045, 8127, 9816

Dissonance (see also Attitude Change)
8893, 8896, 8902, 8903, 8907, 8928, 9540, 9891, 9897

Distance (SEE Perception/Depth)

Distraction (SEE Attention)

Diurnal Rhythms (SEE Biological Rhythms)

Divorce (SEE Marital Problems)

DNA (SEE Biochemistry)

Dog

8231, 8247, 8248, 8344, 8393, 8458, 8476, 8509, 8558, 8559, 8563, 8566, 8569, 8626

Dogmatism (SEE Authoritarianism, Personality Trait)

Dominance (see also Authoritarianism)
8403, 8630, 8828, 8914, 9041, 9482, 9874

Double Blind Design (SEE Experimental Design)

Down's Syndrome (SEE Genetics, Mental Retardation)

Draft (SEE Military)

Draw-a-Man Test (SEE Projective Technique)

Draw-A-Person Test (SEE Projective Technique)

Drawing (see also Aesthetics, Creativity, Picture)
8044, 8746, 8750, 8810, 9068, 9082, 9302, 9331, 9353, 9487, 9565

Dream & Dreaming (see also Rapid Eye Movement, Sleep)
8011, 8089, 9031, 9265, 9266, 9268

Drinking (SEE Alcohol, Water & Water Intake)

Drive (SEE Motivation)

Driving (see also Safety)
8412, 8901, 9357, 9900, 9901, 9902, 9903

DRL (SEE Reinforcement Schedule)

Dropout (SEE School Dropout)

Drug Addiction (see also Drug Effects, Drugs)
9157, 9299, 9300, 9333

Drug Effects (SEE next headings, Drug Addiction)

Drug Effects-Animal (see also Rat/Drug Effects in, Cat/Drug Effects in, Drugs)
8203, 8396, 8400, 8414, 8417, 8418, 8419, 8421, 8422, 8428, 8431, 8432, 8434, 8435, 8437, 8438, 8440, 8443, 8448, 8451, 8455, 8456, 8458, 8459, 8460, 8461, 8462, 8463, 8466, 8469, 8472

Drug Effects-Human (see also Drug Addiction, Drugs)
7955, 7962, 8084, 8405, 8406, 8407, 8408, 8409, 8410, 8411, 8412, 8462, 8464, 9299, 9406

Drug Therapy
9230, 9231, 9232, 9233, 9234, 9235, 9236, 9237, 9238, 9239, 9240, 9241, 9242, 9243, 9244, 9245, 9246, 9247, 9249, 9646

Drug Therapy-Schizophrenia
9240, 9244

Drug Usage & Abuse (see also Drug Addiction, Drugs)
8406, 8412, 8812, 9020, 9021

Drugs (see also Amphetamine, Antidepressant, Chlorpromazine, Lysergic Acid, Diethylamide, Marijuana, Tranquilizer)
7955, 8412, 9242, 9406, 9529, 9778

Dyad (SEE Group/Small, Interpersonal Processes)

Dyslexia (SEE Reading Deficiency)

Ear (see also Audition)
8061, 8073, 8387, 8409

Eating (SEE Food, Food Intake)

Ecology (SEE Environment)

Education (see also next headings, College, Curriculum, School, Teaching, Training)
7967, 8443, 8445, 9451, 9524, 9525, 9536, 9557, 9558, 9696, 9781, 9791, 9808

Education/Adult (SEE Education)

Education/Physical
9074, 9445, 9608, 9787, 9788, 9793, 9794, 9796, 9797, 9801, 9802

Education/Programs in
8742, 9524, 9541, 9653, 9690, 9765, 9782, 9783, 9784, 9785, 9786, 9789, 9792, 9794, 9798, 9799, 9805

Education/Special
9178, 9557, 9588, 9590, 9591, 9594, 9595, 9596, 9597, 9598, 9599, 9600, 9601, 9602, 9603, 9604, 9605, 9606, 9607, 9608, 9609, 9610, 9611, 9612, 9613, 9614, 9615, 9616, 9617, 9618, 9619, 9620, 9621, 9622, 9623, 9624, 9625, 9626, 9627, 9628, 9629, 9630, 9631, 9632, 9633, 9634, 9635, 9636, 9637, 9638, 9639, 9640, 9641, 9642, 9643, 9644, 9645, 9646, 9647, 9648, 9649, 9650, 9651, 9652, 9653, 9654, 9655, 9656, 9657, 9658, 9659, 9660, 9661, 9662, 9663, 9664, 9665, 9666, 9667, 9668, 9669, 9670, 9671, 9672, 9673, 9674, 9675, 9676, 9677, 9678, 9679, 9680, 9681, 9682, 9683, 9684, 9685, 9686, 9687, 9688, 9689, 9690, 9691, 9692, 9693, 9694, 9695, 9696, 9697, 9698, 9699, 9700, 9701, 9702, 9703, 9704, 9705, 9706, 9707, 9708, 9709, 9710, 9711, 9712, 9713, 9714, 9715, 9716, 9717, 9718, 9719, 9720, 9721, 9722, 9723, 9724, 9725, 9726, 9727, 9728, 9729, 9730, 9731, 9732, 9733, 9734, 9735, 9736, 9737, 9738, 9739, 9740, 9741, 9742, 9743, 9744, 9745, 9746, 9747, 9748, 9749, 9750, 9751, 9752, 9753, 9754, 9755, 9756, 9757, 9758, 9759, 9760, 9761, 9762, 9763, 9764, 9765, 9766, 9767, 9768, 9769, 9770, 9771, 9772, 9773, 9774, 9775, 9776, 9777, 9778, 9779, 9780, 9781, 9782, 9783, 9784, 9785, 9786, 9787, 9788, 9789, 9790, 9791, 9792, 9793, 9794, 9795, 9796, 9797, 9798, 9799, 9800, 9801, 9802, 9803, 9804, 9805, 9806, 9807, 9808, 9809, 9810, 9811, 9812, 9813, 9814, 9815, 9816, 9817, 9818, 9819, 9820, 9821, 9822, 9823, 9824, 9825, 9826, 9827, 9828, 9829, 9830, 9831, 9832, 9833, 9834, 9835, 9836, 9837, 9838, 9839, 9840, 9841, 9842, 9843, 9844, 9845, 9846, 9847, 9848, 9849, 9850, 9851, 9852, 9853, 9854, 9855, 9856, 9857, 9858, 9859, 9860, 9861, 9862, 9863, 9864, 9865, 9866, 9867, 9868, 9869, 9870, 9871, 9872, 9873, 9874, 9875, 9876, 9877, 9878, 9879, 9880, 9881, 9882, 9883, 9884, 9885, 9886, 9887, 9888, 9889, 9890, 9891, 9892, 9893, 9894, 9895, 9896, 9897, 9898, 9899, 9900, 9901, 9902, 9903, 9904, 9905, 9906, 9907, 9908, 9909, 9910, 9911, 9912, 9913, 9914, 9915, 9916, 9917, 9918, 9919, 9920, 9921, 9922, 9923, 9924, 9925, 9926, 9927, 9928, 9929, 9930, 9931, 9932, 9933, 9934, 9935, 9936, 9937, 9938, 9939, 9940, 9941, 9942, 9943, 9944, 9945, 9946, 9947, 9948, 9949, 9950, 9951, 9952, 9953, 9954, 9955, 9956, 9957, 9958, 9959, 9960, 9961, 9962, 9963, 9964, 9965, 9966, 9967, 9968, 9969, 9970, 9971, 9972, 9973, 9974, 9975, 9976, 9977, 9978, 9979, 9980, 9981, 9982, 9983, 9984, 9985, 9986, 9987, 9988, 9989, 9990, 9991, 9992, 9993, 9994, 9995, 9996, 9997, 9998, 9999, 10000

Education/Programs in
8742, 9524, 9541, 9653, 9690, 9765, 9782, 9783, 9784, 9785, 9786, 9789, 9792, 9794, 9798, 9799, 9805

Education/Special
9178, 9557, 9588, 9590, 9591, 9594, 9595, 9596, 9597, 9598, 9599, 9600, 9601, 9602, 9603, 9604, 9605, 9606, 9607, 9608, 9609, 9610, 9611, 9612, 9613, 9614, 9615, 9616, 9617, 9618, 9619, 9620, 9621, 9622, 9623, 9624, 9625, 9626, 9627, 9628, 9629, 9630, 9631, 9632, 9633, 9634, 9635, 9636, 9637, 9638, 9639, 9640, 9641, 9642, 9643, 9644, 9645, 9646, 9647, 9648, 9649, 9650, 9651, 9652, 9653, 9654, 9655, 9656, 9657, 9658, 9659, 9660, 9661, 9662, 9663, 9664, 9665, 9666, 9667, 9668, 9669, 9670, 9671, 9672, 9673, 9674, 9675, 9676, 9677, 9678, 9679, 9680, 9681, 9682, 9683, 9684, 9685, 9686, 9687, 9688, 9689, 9690, 9691, 9692, 9693, 9694, 9695, 9696, 9697, 9698, 9699, 9700, 9701, 9702, 9703, 9704, 9705, 9706, 9707, 9708, 9709, 9710, 9711, 9712, 9713, 9714, 9715, 9716, 9717, 9718, 9719, 9720, 9721, 9722, 9723, 9724, 9725, 9726, 9727, 9728, 9729, 9730, 9731, 9732, 9733, 9734, 9735, 9736, 9737, 9738, 9739, 9740, 9741, 9742, 9743, 9744, 9745, 9746, 9747, 9748, 9749, 9750, 9751, 9752, 9753, 9754, 9755, 9756, 9757, 9758, 9759, 9760, 9761, 9762, 9763, 9764, 9765, 9766, 9767, 9768, 9769, 9770, 9771, 9772, 9773, 9774, 9775, 9776, 9777, 9778, 9779, 9780, 9781, 9782, 9783, 9784, 9785, 9786, 9787, 9788, 9789, 9790, 9791, 9792, 9793, 9794, 9795, 9796, 9797, 9798, 9799, 9800, 9801, 9802, 9803, 9804, 9805, 9806, 9807, 9808, 9809, 9810, 9811, 9812, 9813, 9814, 9815, 9816, 9817, 9818, 9819, 9820, 9821, 9822, 9823, 9824, 9825, 9826, 9827, 9828, 9829, 9830, 9831, 9832, 9833, 9834, 9835, 9836, 9837, 9838, 9839, 9840, 9841, 9842, 9843, 9844, 9845, 9846, 9847, 9848, 9849, 9850, 9851, 9852, 9853, 9854, 9855, 9856, 9857, 9858, 9859, 9860, 9861, 9862, 9863, 9864, 9865, 9866, 9867, 9868, 9869, 9870, 9871, 9872, 9873, 9874, 9875, 9876, 9877, 9878, 9879, 9880, 9881, 9882, 9883, 9884, 9885, 9886, 9887, 9888, 9889, 9890, 9891, 9892, 9893, 9894, 9895, 9896, 9897, 9898, 9899, 9900, 9901, 9902, 9903, 9904, 9905, 9906, 9907, 9908, 9909, 9910, 9911, 9912, 9913, 9914, 9915, 9916, 9917, 9918, 9919, 9920, 9921, 9922, 9923, 9924, 9925, 9926, 9927, 9928, 9929, 9930, 9931, 9932, 9933, 9934, 9935, 9936, 9937, 9938, 9939, 9940, 9941, 9942, 9943, 9944, 9945, 9946, 9947, 9948, 9949, 9950, 9951, 9952, 9953, 9954, 9955, 9956, 9957, 9958, 9959, 9960, 9961, 9962, 9963, 9964, 9965, 9966, 9967, 9968, 9969, 9970, 9971, 9972, 9973, 9974, 9975, 9976, 9977, 9978, 9979, 9980, 9981, 9982, 9983, 9984, 9985, 9986, 9987, 9988, 9989, 9990, 9991, 9992, 9993, 9994, 9995, 9996, 9997, 9998, 9999, 10000

Education/Programs in
8742, 9524, 9541, 9653, 9690, 9765, 9782, 9783, 9784, 9785, 9786, 9789, 9792, 9794, 9798, 9799, 9805

Education/Special
9178, 9557, 9588, 9590, 9591, 9594, 9595, 9596, 9597, 9598, 9599, 9600, 9601, 9602, 9603, 9604, 9605, 9606, 9607, 9608, 9609, 9610, 9611, 9612, 9613, 9614, 9615, 9616, 9617, 9618, 9619, 9620, 9621, 9622, 9623, 9624, 9625, 9626, 9627, 9628, 9629, 9630, 9631, 9632, 9633, 9634, 9635, 9636, 9637, 9638, 9639, 9640, 9641, 9642, 9643, 9644, 9645, 9646, 9647, 9648, 9649, 9650, 9651, 9652, 9653, 9654, 9655, 9656, 9657, 9658, 9659, 9660, 9661, 9662, 9663, 9664, 9665, 9666, 9667, 9668, 9669, 9670, 9671, 9672, 9673, 9674, 9675, 9676, 9677, 9678, 9679, 9680, 9681, 9682, 9683, 9684, 9685, 9686, 9687, 9688, 9689, 9690, 9691, 9692, 9693, 9694, 9695, 9696, 9697, 9698, 9699, 9700, 9701, 9702, 9703, 9704, 9705, 9706, 9707, 9708, 9709, 9710, 9711, 9712, 9713, 9714, 9715, 9716, 9717, 9718, 9719, 9720, 9721, 9722, 9723, 9724, 9725, 9726, 9727, 9728, 9729, 9730, 9731, 9732, 9733, 9734, 9735, 9736, 9737, 9738, 9739, 9740, 9741, 9742, 9743, 9744, 9745, 9746, 9747, 9748, 9749, 9750, 9751, 9752, 9753, 9754, 9755, 9756, 9757, 9758, 9759, 9760, 9761, 9762, 9763, 9764, 9765, 9766, 9767, 9768, 9769, 9770, 9771, 9772, 9773, 9774, 9775, 9776, 9777, 9778, 9779, 9780, 9781, 9782, 9783, 9784, 9785, 9786, 9787, 9788, 9789, 9790, 9791, 9792, 9793, 9794, 9795, 9796, 9797, 9798, 9799, 9800, 9801, 9802, 9803, 9804, 9805, 9806, 9807, 9808, 9809, 9810, 9811, 9812, 9813, 9814, 9815, 9816, 9817, 9818, 9819, 9820, 9821, 9822, 9823, 9824, 9825, 9826, 9827, 9828, 9829, 9830, 9831, 9832, 9833, 9834, 9835, 9836, 9837, 9838, 9839, 9840, 9841, 9842, 9843, 9844, 9845, 9846, 9847, 9848, 9849, 9850, 9851, 9852, 9853, 9854, 9855, 9856, 9857, 9858, 9859, 9860, 9861, 9862, 9863, 9864, 9865, 9866, 9867, 9868, 9869, 9870, 9871, 9872, 9873, 9874, 9875, 9876, 9877, 9878, 9879, 9880, 9881, 9882, 9883, 9884, 9885, 9886, 9887, 9888, 9889, 9890, 9891, 9892, 9893, 9894, 9895, 9896, 9897, 9898, 9899, 9900, 9901, 9902, 9903, 9904, 9905, 9906, 9907, 9908, 9909, 9910, 9911, 9912, 9913, 9914, 9915, 9916, 9917, 9918, 9919, 9920, 9921, 9922, 9923, 9924, 9925, 9926, 9927, 9928, 9929, 9930, 9931, 9932, 9933, 9934, 9935, 9936, 9937, 9938, 9939, 9940, 9941, 9942, 9943, 9944, 9945, 9946, 9947, 9948, 9949, 9950, 9951, 9952, 9953, 9954, 9955, 9956, 9957, 9958, 9959, 9960, 9961, 9962, 9963, 9964, 9965, 9966, 9967, 9968, 9969, 9970, 9971, 9972, 9973, 9974, 9975, 9976, 9977, 9978, 9979, 9980, 9981, 9982, 9983, 9984, 9985, 9986, 9987, 9988, 9989, 9990, 9991, 9992, 9993, 9994, 9995, 9996, 9997, 9998, 9999, 1000

BRIEF SUBJECT INDEX

ment/Academic Achievement/Academic-College Achievement/Academic-Elementary School)

Grammar 8696, 8998, 9005, 9006, 9823

Graphology (SEE Writing)

Great Britain

7926, 8784, 9438

Group (see also next headings, Community, Culture, Interpersonal Processes)
8789, 8809, 8908, 8911, 8916, 8922, 8923, 8924, 8929, 8938, 8945, 8954, 8968, 8976, 8982, 9044, 9047, 9181, 9316, 9416, 9434, 9595, 9650, 9653, 9657, 9661, 9664, 9665, 9666, 9672, 9673, 9674, 9680, 9687, 9688, 9723, 9808

Group Discussion 8200, 8924, 8962, 9202

Group Dynamics 8826, 8875, 8913, 8917, 8918, 8920, 8933, 8938, 8947, 8948, 8949, 8954, 8960, 8961, 8967, 9310, 9425, 9683

Group Influence (SEE Social Influence)

Group Structure (SEE Group, Role)

Group Therapy (SEE Psychotherapy/Group)

Group/Ethnic (SEE Ethnology)

Group/Small (see also Interpersonal Processes)
8918, 8920, 8924, 8927, 8938, 8939, 8947, 8948, 8949, 8951, 8958, 8962, 8965, 8980, 9817

Guidance (SEE next headings, Counseling)
Guidance/Child (SEE Psychotherapy/Children, Guidance/Educational)

Guidance/Educational 9647, 9660, 9671, 9677, 9684

Guidance/Vocational 9650, 9660, 9671, 9675, 9681, 9682, 9686, 9838

Guilt (SEE Emotion, Motivation)

Guinea Pig (SEE Animals)

Gustation (SEE Taste)

Habit (SEE Learning, Extinction)

Habituation 8316, 8317, 8347, 8370, 8491, 8503, 8509

Hallucination 9397

Hallucinogen (SEE Drugs, Lysergic Acid Diethylamide)

Halo Effect (SEE Rating Scale)

Hand (see also Body, Motor Performance)

Handedness (SEE Laterality)

Handicap (SEE Childhood/Handicapped, Physical Handicap, Blindness, Deafness & Hearing Disorder)

Handling (see also Experience/Early)

Handwriting (SEE Writing)

Headache (SEE Illness)

Hearing (SEE Audition)

Hearing Loss (SEE Audition, Deafness & Hearing Disorder)

Hearing/Hard of (SEE Deafness & Hearing Disorder)

Heart (see also Blood, Blood-Animal, Blood Pressure, Cardiovascular Processes, Heart Rate)
8090, 8437

Heart Rate

8047, 8095, 8103, 8200, 8281, 8316, 8405, 8437, 8474, 8475, 8478, 8480, 9458

Heat (SEE Temperature)

Height (SEE Physique)

Helping Behavior (SEE Interpersonal Processes)

Heredity (SEE Genetics)

High School (SEE School, Student/High School, Adolescence)

Higher Education (SEE College)

Hippocampus

8238, 8249, 8253, 8270, 8276, 8278, 8285, 8299, 8349, 8372, 8438, 8448, 8451

History (see also Psychology/History of)

8813

Hoarding (SEE Instinctive Behavior)

Homicide (SEE Crime & Criminals, Suicide)

Homosexuality

8813, 9151, 9328, 9330

Honesty (SEE Deception)

Hormone (see also Epinephrine)

8222, 8241, 8251, 8289, 8390, 8393, 8394, 8395, 8396, 8397, 8398, 8399, 8400, 8401, 8402, 8403, 8404, 8446, 8456, 8463, 8494, 8508, 8627, 9233, 9374

Hospital & Hospitalization (see also Clinic, Institution & Institutionalization, Mental Hospital & Hospitalization)
9112, 9252, 9253, 9255, 9260, 9261, 9444

Hostility (see also Aggression)

8098, 8806, 8966, 8971, 9041, 9048, 9314, 9363

Hue (SEE Color)

Human Engineering (SEE Engineering Psychology)

Humor (see also Literature, Language, Emotion)
8096

Hunger (SEE Food Deprivation, Motivation)

Husband (SEE Marriage)

Hypnosis

7943, 8091, 8092, 8093, 9133, 9222, 9226

Hypnotherapy (SEE Hypnosis, Psychotherapy/Methods in)

Hypothalamus

8202, 8215, 8274, 8275, 8277, 8279, 8280, 8287, 8289, 8290, 8294, 8302, 8303, 8306, 8310, 8315, 8423, 8451

Hysteria & Hysterics (see also Mental Disorder, Neurosis, Psychosis)
9290, 9355, 9356, 9364

Id (SEE Psychoanalytic Theory)

Identification

7973, 8035, 8046, 8188, 8189, 8726, 8810, 8893, 9267, 9387, 9742

Identity

8673, 8780, 8839, 8849, 9037, 9151, 9562

Illegitimate Pregnancy (SEE Pregnancy, Mother)

Illness (see also Disease)

8592, 8682, 9260, 9401, 9433, 9497, 9499, 9502, 9503, 9505, 9506, 9507, 9508, 9509, 9523, 9784

Illumination (SEE Brightness, Environment)

Illusion

8023, 8024, 8040, 8106, 8684, 8732, 8812

Image (see also Self-Perception, Social Perception, Body)

7932

Imagery

8129, 8722, 8750, 9005, 9139, 9207, 9673, 9807

Imagination (SEE Fantasy, Cognition, Thinking)

Imitation (see also Instinctive Behavior, Interpersonal Processes, Model)

8687, 8698, 8705, 8773, 8774, 8959, 9326, 9649, 9749

Impression Formation (SEE Social Perception)

Imprinting (SEE Instinctive Behavior, Experience/Early)

Incentive (see also Motivation, Reward, Reinforcement)
8098, 8101, 8599, 8802, 8902, 8910, 8919, 9494, 9537, 9538, 9834, 9835, 9867

Incest (SEE Sexual Deviation)

Incidental Learning (SEE Learning)

Income (SEE Money, Socioeconomic Status)

Independence (SEE Dependency)

India

7993, 8027, 8828, 8886, 9569, 9714

Indian/American (SEE Ethnology)

Individual Differences

8023, 8082, 8492, 8509, 9091, 9568, 9572, 9893

Industrial Psychology (see also Business, Personnel Industrial)

9832, 9883

Industry (SEE Business, Personnel/Industrial)

Infancy (see also Neonate)

8530, 8665, 8666, 8667, 8668, 8669, 8670, 8672, 8673, 8674, 8675, 8678, 8679, 8681, 8691, 8761, 8776, 8847, 8848

Influence (SEE Interpersonal Influence, Persuasion, Social Influence)

Information (see also Communication, Information Theory, Language)

7967, 7971, 7986, 7991, 7999, 8019, 8029, 8034, 8099, 8109, 8114, 8117, 8175, 8179, 8184, 8191, 8192, 8201, 8474, 8514, 8656, 8658, 8721, 8748, 8787, 8875, 8894, 8939, 8964, 8989, 8996, 9040, 9580, 9720, 9887

Information Retrieval (SEE Information Computers)

Information Theory (see also Information)
8995, 9100

Inheritance (SEE Genetics)

Inhibition (see also Extinction, Interference)
8141, 8210, 8255, 8349, 8356, 8362, 8456, 8461, 8567, 8569, 8603, 9463

Inkblot (SEE Projective Technique, Rorschach Test)

Insect

7944, 8234, 8376, 8384, 8388, 8494, 8506, 8624, 8625

Insecurity (SEE Dependency, Neurosis)

Insight (SEE Problem Solving, Thinking, Self-Perception, Social Perception, Therapeutic Process)

Instinctive Behavior (see also Sexual Behavior-Animal)
8255, 8455, 8518, 8533, 8534, 8539, 8536, 8652, 8791

Institute (SEE Organizations, College)

Institution & Institutionalization (see also Hospital & Hospitalization, Mental Hospital & Hospitalization)

8675, 8691, 9248, 9318, 9377, 9484, 9486, 9512

Instruction (see also Teaching)

9770, 9817

Instructions/Experimental

8055, 8075, 8114, 8179, 9761, 9776

Insulin (SEE Hormone)

Insulin Shock Therapy (SEE Therapy)

Integration

9548, 9696

Intellectual Processes (SEE Cognition, Thinking)

Intelligence (see also next headings)
8044, 8731, 874, 8743, 8744, 8745, 8746, 8747, 8748, 8749, 8750, 8751, 8752, 8753, 8754, 8755, 8756, 8757, 8758, 8759, 8760, 8761, 8762, 8763, 8764, 8765, 8766, 8767, 8768, 8769, 8770, 8771, 8772, 8773, 8774, 8775, 8776, 8777, 8778, 8779, 8780, 8781, 8782, 8783, 8784, 8785, 8786, 8787, 8788, 8789, 8790, 8791, 8792, 8793, 8794, 8795, 8796, 8797, 8798, 8799, 8800, 8801, 8802, 8803, 8804, 8805, 8806, 8807, 8808, 8809, 8810, 8811, 8812, 8813, 8814, 8815, 8816, 8817, 8818, 8819, 8820, 8821, 8822, 8823, 8824, 8825, 8826, 8827, 8828, 8829, 8830, 8831, 8832, 8833, 8834, 8835, 8836, 8837, 8838, 8839, 8840, 8841, 8842, 8843, 8844, 8845, 8846, 8847, 8848, 8849, 8850, 8851, 8852, 8853, 8854, 8855, 8856, 8857, 8858, 8859, 8860, 8861, 8862, 8863, 8864, 8865, 8866, 8867, 8868, 8869, 8870, 8871, 8872, 8873, 8874, 8875, 8876, 8877, 8878, 8879, 8880, 8881, 8882, 8883, 8884, 8885, 8886, 8887, 8888, 8889, 8890, 8891, 8892, 8893, 8894, 8895, 8896, 8897, 8898, 8899, 8900, 8901, 8902, 8903, 8904, 8905, 8906, 8907, 8908, 8909, 8910, 8911, 8912, 8913, 8914, 8915, 8916, 8917, 8918, 8919, 8920, 8921, 8922, 8923, 8924, 8925, 8926, 8927, 8928, 8929, 8930, 8931, 8932, 8933, 8934, 8935, 8936, 8937, 8938, 8939, 8940, 8941, 8942, 8943, 8944, 8945, 8946, 8947, 8948, 8949, 8950, 8951, 8952, 8953, 8954, 8955, 8956, 8957, 8958, 8959, 8960, 8961, 8962, 8963, 8964, 8965, 8966, 8967, 8968, 8969, 8970, 8971, 8972, 8973, 8974, 8975, 8976, 8977, 8978, 8979, 8980, 8981, 8982, 8983, 8984, 8985, 8986, 8987, 8988, 8989, 8990, 8991, 8992, 8993, 8994, 8995, 8996, 8997, 8998, 8999, 9000, 9001, 9002, 9003, 9004, 9005, 9006, 9007, 9008, 9009, 9010, 9011, 9012, 9013, 9014, 9015, 9016, 9017, 9018, 9019, 9020, 9021, 9022, 9023, 9024, 9025, 9026, 9027, 9028, 9029, 9030, 9031, 9032, 9033, 9034, 9035, 9036, 9037, 9038, 9039, 9040, 9041, 9042, 9043, 9044, 9045, 9046, 9047, 9048, 9049, 9050, 9051, 9052, 9053, 9054, 9055, 9056, 9057, 9058, 9059, 9060, 9061, 9062, 9063, 9064, 9065, 9066, 9067, 9068, 9069, 9070, 9071, 9072, 9073, 9074, 9075, 9076, 9077, 9078, 9079, 9080, 9081, 9082, 9083, 9084, 9085, 9086, 9087, 9088, 9089, 9090, 9091, 9092, 9093, 9094, 9095, 9096, 9097, 9098, 9099, 9100, 9101, 9102, 9103, 9104, 9105, 9106, 9107, 9108, 9109, 9110, 9111, 9112, 9113, 9114, 9115, 9116, 9117, 9118, 9119, 9120, 9121, 9122, 9123, 9124, 9125, 9126, 9127, 9128, 9129, 9130, 9131, 9132, 9133, 9134, 9135, 9136, 9137, 9138, 9139, 9140, 9141, 9142, 9143, 9144, 9145, 9146, 9147, 9148, 9149, 9150, 9151, 9152, 9153, 9154, 9155, 9156, 9157, 9158, 9159, 9160, 9161, 9162, 9163, 9164, 9165, 9166, 9167, 9168, 9169, 9170, 9171, 9172, 9173, 9174, 9175, 9176, 9177, 9178, 9179, 9180, 9181, 9182, 9183, 9184, 9185, 9186, 9187, 9188, 9189, 9190, 9191, 9192, 9193, 9194, 9195, 9196, 9197, 9198, 9199, 9200, 9201, 9202, 9203, 9204, 9205, 9206, 9207, 9208, 9209, 9210, 9211, 9212, 9213, 9214, 9215, 9216, 9217, 9218, 9219, 9220, 9221, 9222, 9223, 9224, 9225, 9226, 9227, 9228, 9229, 9230, 9231, 9232, 9233, 9234, 9235, 9236, 9237, 9238, 9239, 9240, 9241, 9242, 9243, 9244, 9245, 9246, 9247, 9248, 9249, 9250, 9251, 9252, 9253, 9254, 9255, 9256, 9257, 9258, 9259, 9260, 9261, 9262, 9263, 9264, 9265, 9266, 9267, 9268, 9269, 9270, 9271, 9272, 9273, 9274, 9275, 9276, 9277, 9278, 9279, 9280, 9281, 9282, 9283, 9284, 9285, 9286, 9287, 9288, 9289, 9290, 9291, 9292, 9293, 9294, 9295, 9296, 9297, 9298, 9299, 9300, 9301, 9302, 9303, 9304, 9305, 9306, 9307, 9308, 9309, 9310, 9311, 9312, 9313, 9314, 9315, 9316, 9317, 9318, 9319, 9320, 9321, 9322, 9323, 9324, 9325, 9326, 9327, 9328, 9329, 9330, 9331, 9332, 9333, 9334, 9335, 9336, 9337, 9338, 9339, 9340, 9341, 9342, 9343, 9344, 9345, 9346, 9347, 9348, 9349, 9350, 9351, 9352, 9353, 9354, 9355, 9356, 9357, 9358, 9359, 9360, 9361, 9362, 9363, 9364, 9365, 9366, 9367, 9368, 9369, 9370, 9371, 9372, 9373, 9374, 9375, 9376, 9377, 9378, 9379, 9380, 9381, 9382, 9383, 9384, 9385, 9386, 9387, 9388, 9389, 9390, 9391, 9392, 9393, 9394, 9395, 9396, 9397, 9398, 9399, 9400, 9401, 9402, 9403, 9404, 9405, 9406, 9407, 9408, 9409, 9410, 9411, 9412, 9413, 9414, 9415, 9416, 9417, 9418, 9419, 9420, 9421, 9422, 9423, 9424, 9425, 9426, 9427, 9428, 9429, 9430, 9431, 9432, 9433, 9434, 9435, 9436, 9437, 9438, 9439, 9440, 9441, 9442, 9443, 9444, 9445, 9446, 9447, 9448, 9449, 9450, 9451, 9452, 9453, 9454, 9455, 9456, 9457, 9458, 9459, 9460, 9461, 9462, 9463, 9464, 9465, 9466, 9467, 9468, 9469, 9470, 9471, 9472, 9473, 9474, 9475, 9476, 9477, 9478, 9479, 9480, 9481, 9482, 9483, 9484, 9485, 9486, 9487, 9488, 9489, 9490, 9491, 9492,

BRIEF SUBJECT INDEX

- 8912, 8915, 8925, 8927, 8928, 8929, 8931, 8932, 8934, 8935, 8937, 8940, 8941, 8942, 8947, 8956, 8960, 8964, 8980, 9053, 9127, 9220, 9380, 9416, 9419, 9421, 9428, 9434, 9511, 9543, 9551, 9654, 9661, 9678, 9711, 9755, 9808, 9833, 9866, 9879, 9880, 9881
- Interresponse Interval** (SEE Interval/Time)
- Intersensory Processes**
8020, 8376, 8479, 8647, 8664, 8916, 8922, 8923, 9724, 9759
- Interval/Interstimulus**
8038, 8099, 8119, 8582, 8586, 8613
- Interval/Time**
8046, 8056, 8062, 8072, 8151, 8201, 8314, 8366, 8547, 8556, 8578, 8588, 8589, 8601, 8605, 8610, 8613, 9216
- Interview & Interviewing** (see also Counseling, Guidance Educational, Guidance-Vocational, Psychotherapy)
8890, 8977, 9380, 9660, 9669, 9679, 9842, 9845, 9847
- Introversiön** (SEE Extroversion-Introversiön)
- Intuition** (SEE Thinking, Cognition)
- Inventory** (see also Questionnaire, Survey)
8232, 9400
- Isolation** (see also Alienation)
8466, 8521, 8524, 8626, 8687
- Israel**
- Item** (see also Test & Testing, Testing Methods)
7987, 7991, 8765, 8878, 9073, 9076, 9077, 9575
- Japan**
8137, 9337
- Jew** (SEE Religion, Ethnology)
- Job** (SEE next headings, Occupation, Personnel Industrial Work & Work Analysis)
- Job Evaluation** (SEE Occupation Work & Work Analysis)
- Job Performance**
9533, 9701, 9713, 9836, 9852, 9858, 9860, 9862, 9863, 9866, 9868, 9875, 9881
- Job Satisfaction**
9413, 9709, 9855, 9856, 9857, 9858, 9861, 9864, 9865, 9868, 9874, 9878
- Judgment**
8827, 8875, 8878, 8884, 9037, 9572
- Judgment/Perceptual** (see also Perception, the various senses)
8016, 8018, 8023, 8076, 8106, 8905, 9049
- Junior College** (SEE College)
- Junior High School** (SEE School, Student/Junior High School)
- Juvenile Delinquency** (SEE Delinquency/Juvenile)
- Kibbutz/Israel** (SEE Israel)
- Kindergarten** (SEE Childhood/Preschool)
- Kinesthesia** (see also Movement)
8158, 8163, 8221, 9447
- Kinship** (SEE Family, Culture)
- Knowledge of Results** (SEE Feedback, Reinforcement, Information)
- Korsakov's Psychosis** (SEE Alcoholism, Brain Disorder)
- Labor Relations** (SEE Personnel Industrial, Management)
- Language** (see also next headings, Communication, Information, Speech, Psycholinguistics, Verbal Behavior)
7950, 8012, 8137, 8152, 8156, 8552, 8687, 8727, 8734, 8806, 8873, 8987, 8997, 8998, 8999, 9000, 9001, 9003, 9004, 9005, 9006, 9008, 9009, 9010, 9011, 9012, 9016, 9195, 9271, 9526, 9530, 9574, 9605
- Language Development**
8683, 8691, 8733, 8742, 9015
- Language/Foreign**
8157, 8653, 8742, 8873, 9001, 9005, 9011, 9567, 9604, 9809
- Latent Learning** (SEE Learning)
- Laterality**
8033, 8064, 8124, 8127, 8153, 8230, 8232, 8283, 8294, 8342, 9635
- Latin America**
8812, 8814, 8831, 8856, 9274, 9275, 9278, 9281, 9283, 9284, 9285, 9294, 9295, 9333, 9340, 9594
- Law** (see also Government, Political Behavior)
7956, 7959, 8171, 8700, 8877, 9310, 983
- Leadership** (see also Management)
8862, 8910, 8916, 8922, 8923, 8939, 8950, 8951, 8958, 8960, 9028, 9691, 9792, 9846, 9862, 9880, 9883, 9884
- Learning** (see also next headings, Association, Conditioning, School Learning, Rat Learning in, Monkey/Learning in, Cat/Learning in, Childhood/Learning in)
7951, 7999, 8030, 8128, 8129, 8132, 8134, 8150, 8160, 8496, 8514, 8555, 8895, 8914, 9305, 9703, 9718
- Learning Disorders**
8778, 9090, 9107, 9529, 9588, 9599, 9600, 9622, 9623, 9627, 9631, 9638, 9639, 9641, 9645
- Learning Model** (SEE Model)
- Learning Set** (SEE Set, Expectation)
- Learning Theory**
8140
- Learning Transfer**
8130, 8141, 8260, 8270, 8439, 8577, 8717, 9723, 9758
- Learning/Avoidance** (see also Rat/Avoidance & Avoidance Learning in)
8238, 8258, 8362, 8394, 8417, 8426, 8456, 8461, 8484, 8485, 8515, 8582, 8583, 8588, 8589, 8591, 8592, 9203, 9214
- Learning/Discrimination** (see also Discrimination Reversal, Rat Discrimination in)
8217, 8238, 8254, 8428, 8554, 8570, 8572, 8578, 8579, 8583, 8606, 8704, 8707, 8709
- Learning/Escape** (SEE Escape)
- Learning/Incidental** (SEE Learning)
- Learning/Instrumental** (SEE Conditioning, Operant Rat/Conditioning in)
- Learning/Maze** (see also Rat/Maze Learning in)
8515, 8553
- Learning/Motor**
8162, 8324, 9042, 9793, 9797
- Learning/Over** (SEE Learning)
- Learning/Partner Associate**
8141, 8142, 8143, 8144, 8655, 8659, 8711, 8712, 8799, 8802, 8912, 9047, 9097, 9471, 9495, 9537, 9626, 9644, 9748, 9759, 9777
- Learning/Probability**
8131, 8132, 8133, 8193, 8710
- Learning/Reversal** (see also Discrimination Reversal)
8244, 8710
- Learning/Serial**
8155, 8175, 8719, 9078
- Learning/Verbal** (see also Learning/Partner Associate)
8139, 8140, 8143, 8159, 8181, 8661, 9568, 9679, 9755, 9776
- Legibility** (SEE Display, Writing)
- Leisure** (SEE Recreation)
- Lesion** (see also Brain Lesion, Brain Lesion Animal, Rat/Lesions in, Cat Lesions in)
8394, 8396, 8401, 8501
- Liberalism** (SEE Political Behavior, Personality Trait)
- Licensing** (SEE Law)
- Light** (see also Brightness, Color)
8018, 8031, 8038, 8041, 8042, 8068, 8218, 8318, 8333, 8377, 8386, 8518, 8581, 8636, 8642, 8644, 9506
- Light Adaptation** (SEE Adaptation/Sensory)
- Lighting** (SEE Brightness, Environment)
- Liking** (SEE Interpersonal Attraction)
- Linguistics** (SEE Language, Psycholinguistics)
- Listening** (SEE Attention, Audition, Speech Perception)
- Literature**
- 8694, 8783, 9223, 9262, 9351
- Lobotomy** (SEE Brain Lesion, Brain Lesion Animal)
- Localization**
8073, 8202, 8230, 8246, 8384, 8390, 8560
- Logic** (see also Thinking)
7937, 9006, 9572
- Loneliness** (SEE Isolation, Alienation)
- Longitudinal Study** (SEE Experimental Design)
- Loudness** (SEE Audition, Noise, Sound)
- Love** (SEE Emotion)
- Lower Class** (SEE Socioeconomic Status)
- LSD** (SEE Lysergic Acid Diethylamide)
- Luminance** (SEE Brightness, Environment)
- Lying** (SEE Deception)
- Lysergic Acid Diethylamide**
8408, 8469, 9021, 9157
- MA Scale** (SEE Anxiety)
- Machine** (SEE Apparatus)
- Man-Machine Systems** (SEE Engineering Psychology)
- Management** (see also Business, Leadership)
8846, 9832, 9850, 9856, 9858, 9864, 9873, 9874, 9875, 9876, 9878, 9879, 9880, 9881, 9882, 9883, 9884, 9885
- Mania** (SEE Mental Disorder, Emotions, Disturbance)
- Manic-Depressive Psychosis** (SEE Depression, Psychosis)

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.).—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.) (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement: g, kg, L, mL, mm, cm, m, s, min, h, d, wk, mo, yr.

AA = Alcoholics Anonymous
AC = alternating current
ACTH = adrenocorticotrophic hormone
AM = ante meridiem
amp. = ampere

bpm = beats per minute

C = centigrade
c = cents
CA = chronological age
cc = cubic centimeter
C(R = conditioned emotional response
CHF = critical flicker frequency
CNS = central nervous system
cps = cycles per second
CR = conditioned response (or reflex)
CRF = continuous reinforcement
CRT = cathode ray tube
CS = conditioned stimulus
CVC = consonant-vowel-consonant

- db, =decibel
- DC =direct current
- DL =differential limen
- DNA =deoxyribonucleic acid
- DRL =differential reinforcement of low rates

F = experimenter
ICS = electroconvulsive shock
EEG = electroencephalogram (or -graphy)
EKG = electrocardiogram
EMG = electromyogram
ESP = extrasensory perception
Exp. = experiment

f.	= Fahrenheit
ft.-c.	= footcandle
ft.-l.	= foot-lambert

R = gravity
gm = gram(s)

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous terms to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) *Single cell activity in the hypothalamus in intact and adrenalectomized rats.* (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.)—(10) *Journal abstract.*

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the author and article cited to determine the abstract number for the cited article.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U Chicago Medical School*) (4) *Sleep and dreams.* (5) New York, N Y (6a) 1970 (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper)

1—Name of author(s) or editor(s) if more than four authors the first author is listed followed by et al Succession marks are not given, e.g. Jr. II III etc

2—Designation of editor

VOLUME 46

DECEMBER 1971

NUMBER 6

ERRATA

Article titles which were omitted in Vol. 45 are listed following the abstract number.

PA, Vol. 45:2230: Dealing with ministers' defenses.

PA, Vol. 45:2623: Comparing the classification of subjects by two independent judges.

PA, Vol. 45:3007: Developmental group counseling: An outcome study.

PA, Vol. 45:3359: Auditory pattern perception: Processing limits and organization tendencies.

PA, Vol. 45:6612: Aspects of alcoholics' self-concepts as measured by the Tennessee Self-Concept Scale.

PA, Vol. 45:6620: Completed suicide and month of birth.

PA, Vol. 45:8025: The healing community: Church and mental hospital.

PA, Vol. 45:8161: Diffusions of innovation research bibliography: Supplement.

PA, Vol. 45:8684: The principle of normalization and its implications to psychiatric services.

PA, Vol. 45:10562: Self-destructive behavior of uncooperative diabetics.

The following corrections refer to journal information which was omitted or listed incorrectly. The correct entry follows each abstract number.

PA, Vol. 46:3273: Vol. 31(7-A).

PA, Vol. 46:4290: (See PA, Vol. 46:Issue 3).

PA, Vol. 46:4952: *Journal of Personality & Social Psychology*.

PA, Vol. 46:5355: *Training School Bulletin*.

PA, Vol. 46:5435: *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*

PA, Vol. 46:5453: Vol. 63(9).

PA, Vol. 46:6386: Vol. 2.

PA, Vol. 46:6548: *Dissertation Abstracts International*.

PA, Vol. 46:9181: *Bulletin de Psychologie*.

GENERAL

OBITUARIES

9904. Miyamoto, Misako. (Japan Women's U., Tokyo) **Professor Abraham H. Maslow (1908-1970).** *Psychologia: An International Journal of Psychology in the Orient*, 1970(Sep), Vol. 13(2-3), 120.—Presents a tribute to A. H. Maslow whose unique contribution to psychology lay in his concern with healthy people and "the

new cognition of growth motivation." He called his view "humanistic psychology" and contrasted it with neo-behaviorism and neo-Freudianism. He was interested in Zen and Taoistic knowledge and had a deep insight into them.—R. D. Nance.

HISTORY

9905. Hall, Elizabeth. "Absolute ozer": A sketch of Kurt Lewin. *Psychology Today*, 1971(May), Vol. 4(12), 72.—Describes the professional life and continuing impact of Kurt Lewin.—E. J. Posavac.

9906. Holmes, John H. Three evils of present-day psychology. *Journal of Individual Psychology*, 1971(May), Vol. 27(1), 19-24. Condenses a 1930 sermon in which are noted a materialistic trend neglecting spiritual elements which comprise the substance of personality, overemphasis on self-centeredness, and lack of social concern.—A. R. Howard.

9907. Meuris, Georges. (U. Louvain, Lab. of Experimental Pedagogy, Belgium) Jan-Amos Komensky-Comenius (1592-1670), *pédagogue d'aujourd'hui*. [Jan Amos Kohmensky-Comenius (1592-1670) modern educator.] *Revue de Psychologie et des Sciences de l'Education*, 1971, Vol. 6(1), 67-75.—The actual significance of J. A. Kohmensky-Comenius, as both a thinker and a pedagogue, is becoming ever more evident. From a pedagogical viewpoint Comenius is renowned in connection with principles held by contemporary pedagogues and which founded his reputation as a pioneer of educational organization, active methods, intuition and popularization of learning. From a philosophical and political viewpoint, Comenius is regarded as a forerunner of modern ideas: the promotion of harmony and cooperation among peoples through sciences, culture, and philosophical tolerance. (Flemish summary) (21 ref.)—English summary.

PHILOSOPHY

9908. Anzai, Jiro. (Ed.) (Otemongakun I. Osaka, Japan) Two cases of Zen awakening (Kensho) experiences: I. Master Shibayama's case. *Psychologia: An International Journal of Psychology in the Orient*, 1970(Sep), Vol. 13(2-3), 140-144. —San-zen means the Zen disciple's diurnal visits to the Zen master to present him the novice's response obtained through meditation. The novice "casts his real image in the mirror of the master's." Essentially everyone undergoes the same sort of experiences. The author reports some of his own. He stresses the importance of the "after-awakening phase" in the Zenist's life. If Zen's ideals have not been fully realized, it should be practiced constantly.—R. D. Nance

9909. Downing, George D. (Yale U.) Freud's concept of unconscious mind. *Dissertation Abstracts International*, 1971(Jun), Vol. 31(12-A), 6658

9910. Feibleman, James K. **An introduction to the philosophy of Charles S. Peirce: Interpreted as a system.** Cambridge Mass. Massachusetts Inst of Technology Press, 1970. xiv, 503 p. \$12.50 (cloth), \$2.95 (paper).

9911. Feibleman, James K. **Psychology.** In J. K. Feibleman "An introduction to the philosophy of Charles S. Peirce: Interpreted as a system" (See PA, Vol. 46: Issue 6) 215-273.

PARAPSYCHOLOGY

9912. Beloff, John & Bate, David. **An attempt to replicate the Schmidt findings.** *Journal of the Society for Psychical Research*, 1971(Mar), Vol. 46(4), 21-31. Creating 4 test conditions: direct or precognitive guessing with immediate or delayed feedback; an electric machine randomly selected a "target" which the Ss would guess, either before machine selection (testing precognitive guessing) or after (testing clairvoyant, telepathic). Feedback could be present or withheld. Although none of the results reached significance, failing to provide evidence of ESP, this is not believed to detract from H. Schmidt's (see PA, Vol. 44:4322 and 4466) successes. The delayed feedback condition did produce superior results though not significant. This is viewed as consistent with J. B. Rhine's view that immediate feedback tends to disrupt unconscious processes on which ESP would seem to depend.—G. J. Frankel.

9913. Levy, Walter J., Mayo, L. Allen, André, Eve, & McKee, Anita. (Medical Coll of Georgia, Augusta) **Precognition experiments with mice: Repetition of the French.** *Journal of Parapsychology*, 1971(Mar), Vol. 35(1), 1-17. Replicated the work of P. Duval and I. Montredon (see PA, Vol. 43:13484) in 6 exploratory precognition tests with 14 Swiss Webster mice and 9 jirds. Ss were tested on their ability to use their psi to avoid jumping onto the side of the cage which would be electrified in forthcoming S-see trials. Out of 1,154 random-behavior trials, Ss made a hit (avoided shock) 612 times ($p < .05$). Since the apparatus monitored Ss' positions at all times in the cage, it was possible to reanalyze the data for evidence of psi in behavior patterns. It was found that (a) Ss significantly avoided shocks after a nonshock trial ($p < .015$), (b) the number of hits after shock trials was not significant, (c) trials following a period of low activity (fewer than 3 jumps back and forth during the ITI) were significant ($p = .015$); and (d) trials following 3 or more jumps were not significant. When both successful conditions (nonshock and low activity) were combined, separation was significant at the .006 level. Possible E effects in the experiments are discussed.—*Journal abstract*.

9914. Lichtenstein, Parker E. (Denison U.) **A behavioral approach to "phenomenological data."** *Psychological Record*, 1971(Win), Vol. 21(1), 1-16. Assesses the importance of the recent resurgence of phenomenology emphasizing both the strengths and weaknesses of the system. An attempt is made to place phenomenology within the framework of a broadened behavioral psychology. (45 ref.) *Journal abstract*.

9915. Medhurst, R. G. **The origin of the "prepared random numbers" used in the Shackleton experiments.** *Journal of the Society for Physical Research*, 1971(Mar), Vol. 46(747), 39-55.—Attempting to refute G. Albert's allegation of fraud with "target numbers."

the replication of the experiments' methodology sections is discussed. From 1940-1954 S. G. Soal made statements indicating the numbers' selection source could be found by exhaustive search. Had this been achieved, conclusive proof might have been present to indicate the allegation. However, Soal did not believe these procedures to be true, as in the Shackleton sessions. Various methods are suggested for origin, yet are not substantiated. Medhurst does not believe these results to suggest the possibility of fraud, but may or may not create an element of doubt on the accuracy of the experiments reports.—G. J. Frankel.

9916. Randall, J. L. **Experiments to detect a psi effect with small animals.** *Journal of the Society for Psychical Research*, 1971(Mar), Vol. 46(747), 31-39.—E placed a wood louse (*Oniscus asellus*) in the center of 2 concentric circles as S looked at the 1st card of a pack of standard ESP cards from a sealed envelope. A hit was scored when any part of the animal's body crossed into a sector. Completing 25 trials (a run), cards were turned, reread to Es, who recorded them opposite the results. 15 Ss completed runs spread out over a period of weeks. The final overall control ratio was 1.8 (2 = chosen level of significance). Although all possible physical factors could not be excluded, the results' attribution to chance seems unlikely. The most likely explanation is believed to be a psi effect between the S and the animal.—G. J. Frankel.

9917. Rhine, J. B. (Inst. for Parapsychology, Durham N.C.) **Location of hidden objects by a man-dog team.** *Journal of Parapsychology*, 1971(Mar), Vol. 35(1), 18-33.—Conducted an experiment in which 2 German shepherd dogs and their trainer, as a team, attempted to locate empty land mine cases that were buried in a straight line 4 m deep in sand under 6-12 in. of water. Each 5-yd section made up of 5 1-yd units, contained a buried mine, the location of which was determined by a random number table. All surface signs except section and unit locations were removed by raking. The dog was led over each section as a single trial, continuing to retrace until it indicated a location by sitting. The E who buried the mine observed and recorded the team's responses from a screened position. When an assistant was present, the recording O did not know the target positions. Steady crosswinds, surface ripples, and strong side currents in the water gave good assurance against olfactory cues. On 203 underwater trials there were 38.9% hits where only 20% was expected ($p < .001$). Thereafter a decline set in with both dogs, although there were no changes in personnel or overt conditions. Possible psychological factors are noted which suggest an essential link in the man-dog relation.—*Journal abstract*.

9918. Rhine, Louisa E. (Inst. of Parapsychology, Durham, N.C.) **The establishment of basic concepts and terminology in parapsychology.** *Journal of Parapsychology*, 1971(Mar), Vol. 35(1), 34-56.—Reviews the research in parapsychology and the development of the concepts and terminology in 3 historical periods: (a) the preexperimental period before 1930, (b) the modern experimental period from 1930-1950, and (c) the present. Previous experimental period from 1951 to the present. Previous to 1930, only telepathy and clairvoyance were considered, but evidence was lacking and the theories diverse. After 1930 clairvoyance, telepathy, and eventually precognition were shown to occur in a laboratory setting. These abilities were labeled ESP and experiments

indicated that they were similar aspects of a single ability. Later findings of psychokinesis were interpreted as the motor aspect of the cognitive ESP abilities and the 2 together were given the name of psi. Experiments in the modern period have indicated that psi is an unconscious ability and have concentrated on the ways in which it operates. Experimental procedures, findings, and terminology in the modern period are discussed. (35 ref.)—S. Knapp.

THEORY & SYSTEMS

9919. ———. **Comment and queries: Revivalism in psychology.** *Psychological Record*, 1971(Win), Vol. 21(1), 131-134. —Examination of the succession of basic psychological theories shows that they are not novel approaches to psychological data and problems, but revivals of mentalistic theories in somewhat modified form. Since this revivalism is not conducive to scientific progress, the question arises why it persists and flourishes, in view of the ease of distinguishing between authentic observations and fictional interpretations. It is suggested that revivalism in psychology and other sciences is influenced by spiritistic intellectual institutions which in turn reflect the general spiritistic foundations of Western civilization.—*Journal abstract.*

9920. Johnson, Edgar M. **A bibliography on the use of information theory in psychology (1948-1966).** Aberdeen Proving Ground, Md: U.S. Army, Aberdeen Research & Development Center, Human Engineering Lab., 1970. 22 p. —Presents a bibliography of work done in, or relevant to, psychology using information theory. This listing is a supplement to "A bibliography on the use of information theory in psychology (1948-1966)" published in December 1967. An index is included. (186 ref.)—*Journal abstract.*

EDUCATION & TRAINING

PROFESSIONAL DEVELOPMENTS

INTERNATIONAL PSYCHOLOGY

9921. Kuo, You-Yuh. (Ball State U.) **Psychology in Communist China.** *Psychological Record*, 1971(Win), Vol. 21(1), 95-105. —Outlines the theory and development of psychology in Communist China emphasizing the differences between Western and Communist Chinese psychology. Mainland Chinese psychologists are described as seeking a psychological basis for communism. Psychology is defined as the brain's reflection of reality, determined by the contradictions that exist in objective reality and the ideology of the social class to which the individual belongs. Western psychology is blamed for helping the capitalists to suppress the workers' class struggle. Research on the development of the brain function in children is being conducted with the EEG instead of intelligence tests, while Piaget's theory is being used to study cognitive development. Research is also described as emphasizing the traditional Chinese interest in moral development. Research and professional organizations and publications are noted. (25 ref.)—*Journal abstract.*

METHODOLOGY & RESEARCH TECHNOLOGY

MODELS & MATHEMATICAL MODELS

9922. Abbott, Robert D. (U. Washington) **Further evidence regarding trait and evaluative models of response consistency.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-B), 6235.

MATHEMATICS & STATISTICS

9923. Auerbach, Carl. (Yeshiva U.) **Correcting two-alternative forced-choice data for response bias.** *Perceptual & Motor Skills*, 1971(Apr), Vol. 32(2), 533-534. —Describes a method for correcting 2-alternative forced-choice data for response bias which requires only a table of integrals of a normal distribution.—*Journal abstract.*

9924. Barbut, M. (Practical School for Higher Studies, Paris, France) **Une classe de quasi-groupes qui peuvent servir à représenter des "moyennes."** [A class of quasi-groups which can represent means.] *Mathématiques et Sciences Humaines*, 1970(1ab), No. 31, 33-37. —Demonstrates certain relationships between Abelian groups and ordered quasi-groups. Under given restraints the binary operation $x * y$ can be interpreted as a weighted mean. M. G. Strobel

9925. Bartussek, Dieter. (U. Hamburg, Inst. of Psychology, W. Germany) **Eine Methode zur Bestimmung von Moderatorreflektoren.** [A method for determination of moderator effects.] *Diagnostica*, 1970, Vol. 16(2), 57-76. —Reviewing and critically evaluating the 2 presently used methods (Anastasi and Ghisella) for differentiation of individuals in terms of their predictability, a new approach is described—Saunders' method for the determination of "moderated regression" appears to avoid the pitfalls of the previous methods. This model is presented and linear and nonlinear moderator functions are estimated. The data were subjected to significance testing and 2 possible interpretations of the significant moderator effects are evolved. 5 advantages of the Saunders model are listed. (21 ref.) H. Muth

9926. Brown, Thomas S. (Texas Christian U.) **Correction for overlap in principal component loadings.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-B), 6278.

9927. Carter, Michael C. (U. Georgia) **A Bayesian analysis of concomitant information.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-B), 6279.

9928. Cormier, Roger A. (U. Montreal, Quebec, Canada) **Of significant and important differences.** *Alberta Journal of Educational Research*, 1971(Mar), Vol. 17(1), 33-42. —Points out abuses of search for significant differences. The researcher is advised to use descriptive statistics rather than rely on Fisherian methodology which often leads to contradictory conclusions. The approaches of Bayes and of Neyman-Pearson are recommended in lieu of Fisherian statistical inference.—A. M. Chavsky

9929. Cutter, Henry S. & Heitler, Fred. (Veterans Administration Hosp., Brockton, Mass.) **Logic of analysis of variance in relation to predictions and evaluations of interaction means.** *Psychological Record*

GENERAL BOOKS & REFERENCE WORKS

ports, 1971(Jun), Vol. 28(3), 839-842.—Discusses the customary confounding of row and column effects with their interaction in terms of cell means purported to represent the interaction. Row, column, and overall mean corrections for cell means are outlined that clarify the relation between the mean and variance components of an interaction. Implications of this methodology for graphic and tabular representations of and interpretations of relationships among the means involved in an interaction are discussed.—*Journal abstract*

9930. Domotor, Zoltan & Stelzer, John. (Stanford U.) Representation of finitely additive semiorordered qualitative probability structures. *Journal of Mathematical Psychology*, 1971(May), Vol. 8(2), 145-158.—Given a finite Boolean algebra together with a binary relation, necessary and sufficient conditions are given for the existence of a probability measure on the algebra and a real number—the so-called just noticeable difference (jnd)—such that for any 2 Boolean elements the relation holds if and only if the corresponding probability values of the elements satisfy the threshold inequality (the difference of the probabilities is greater than the jnd). Some of the applications of this theorem to indifference structures are also discussed.—*Journal abstract*

9931. Fisher, Mary A. (U. Connecticut) A note on the generalization of some results in hypothesis sampling theory. *Journal of Mathematical Psychology*, 1971(May), Vol. 8(2), 235-239.—A basic derivation of Trabasso and G. H. Bower, that presolution probability of correct responding is constant and equal to p , uses 2 statements which are not true in general. The theorem can, however, be proved in the special case $p = .5$, by a different method as shown here. A modified result in which the presolution probability of correct responding depends on the composition of the focus sample is also derived for the general case of $p \neq .5$.—*Journal abstract*

9932. Forsyth, Robert A. (U. Iowa) An empirical note on correlation coefficients corrected for restriction in range. *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 115-123.—24 different sampling distributions of correlation coefficients corrected for restriction in range were generated for 3 sample sizes, 4 cutoff points, and 2 population values. Fisher's z transformation to establish confidence limits proved to be inaccurate. A more satisfactory trial and error procedure was undertaken to adjust standard errors. N. M. Chansky.

9933. Horn, John. (U. Denver) Integration of concepts of reliability and standard error of measurement. *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 57-74.—Attempted to clarify the distinction between assumptions underlying derivations of various indices or error of measurement and coefficients of reliability such as Kuder-Richardson Formulas 20 and 21. Theoretical models are provided along with their derivations. Data are presented to illustrate the extent different reliability coefficients affect standard errors of measurement and their respective confidence intervals using the same summary statistics. The results show that different models lead to somewhat different reliability coefficients. The decision as to which coefficient to use is left to the user. (20 ref.) R. W. Covert.

9934. Jernigan, Larry R. (Texas Christian U.) The development and investigation of a method for removing the effects of the distribution of mean values from the relationships among binary variables.

Dissertation Abstracts International, 1971(Apr), Vol. 31(4-B), 624.

9935. Leclerc, B. (Practical School for Higher Studies, Paris, France) Applications pratiques de lois de probabilité VII. [Practical application of the law of probability VII.] *Mathematiques et Sciences Humaines*, 1970(Sum), No. 30, 43-51.—The models in this series of selected articles converge on the formation of groups. The central role of the Poisson distribution and diverse applications of the negative binomial distribution are demonstrated. The number of distributions obtained is inferior to the number of models proposed. Several well-known distributions are applied to problems in history, sociology, psychology, economics, and ecology.—M. G. Strabel.

9936. Leclerc, H. (Practical School for Higher Studies, Paris, France) Applications pratiques des lois de probabilités VIII. [Practical applications of the law of probability VIII.] *Mathematiques et Sciences Humaines*, 1970(Fall), No. 31, 57-63.—Presents a series of selected articles which demonstrate the applicability of the Poisson, gamma, exponential, and binomial distribution to problems in history, genetics, zoology, and psychology.—M. G. Strabel.

9937. Levin, Joseph. (Tel-Aviv U., Israel) A least squares fit for comparison of configurations of points in two-dimensional space. *Psychological Reports*, 1971(Jun), Vol. 28(3), 999-1002.—Reports that multidimensional scaling techniques map a set of objects into geometric space, usually Euclidean. As the solutions are not unique, and linear transformations are admissible operations, 2 solutions for a given set of objects are not comparable owing to differences of the coordinate systems. A transformation of coordinates to obtain a least squares fit of 2 configurations is derived for the 2-dimensional case.—*Journal abstract*.

9938. Livingston, Samuel A. & Stanley, Julian C. (Johns Hopkins U., Center for Social Organization of Schools) What is the true coefficient of partial correlation? *Center for Social Organization of Schools Report, Johns Hopkins U.*, 1971(Jul), No. 107, 8 p.—The correction of the 1st-order partial correlation coefficient for attenuation due to errors of measurement reveals a seeming paradox in test-score theory. Although other studies have touched on the problem in connection with measures of change and the reliability of errors of estimate, none has directly confronted the discrepancy discussed here. Although partial correlation is a correlation of residuals, the correlation of the true-score components of these residuals is not equivalent to the partial correlation of the true scores themselves. The source of this discrepancy is explained and its implications are briefly discussed.—*Journal abstract*.

9939. Lu, K. H. (U. Oregon, Dental School) A measure of agreement among subjective judgments. *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 75-84.—Attempted to devise a coefficient of agreement of judges of categorical data based on a weighing procedure of the categories. The coefficient is based on 2 measures of agreement, the maximum within-S variance and the maximum within-S entropy which are appropriately weighted. The weights of Y are determined on a probabilistic scale in terms of the distribution function of random variable X . The statistic θ which is a ratio of within-S variance to within-S entropy is distributed as χ^2/df where df is the number of

5s times the number of raters minus 1. An example of the statistics use is provided. *R. W. Covert.*

9940. Moeschberger, Melvin L. (North Carolina State U.) **A parametric approach to life-testing and the theory of competing risks.** *Dissertation Abstracts International*, 1971(May). Vol. 31(11-B). 6984-6985.

9941. Morrison, Denton E. & Henkel, Ramon E. (Eds.) (Michigan State U.) **The significance test controversy.** Chicago, Ill.: Aldine, 1970. xviii, 333 p. \$12.50.—Presents a collection of papers dealing with some of the basic mathematical, philosophy of science, and statistical assumptions connected with significance tests. Information is included on the continuing debate about the usefulness of tests, the central issues involved, and practical problems and possible pitfalls involved in using the tests.

9942. Roberts, Fred S. (RAND Corp., Santa Monica, Calif.) **Homogenous families of semiorders and the theory of probabilistic consistency.** *Journal of Mathematical Psychology*, 1971(May). Vol. 8(2). 248-263.—Beginning with the data $p(a,b)$, interpreted as the frequency with which a is preferred to b , various conditions of probabilistic consistency are defined on this data. Most of these are expressed as conditions on a family of binary relations defined from the $p(a,b)$'s, where a is in the λ th relation to b if $p(a,b) > \lambda$. The conditions essentially state that this family of relations is a homogenous or consistent family of semiorders. The conditions are then restated in a more general setting, starting with a family of binary relations rather than with the data $p(a,b)$ and the particular family of relations defined from $p(a,b)$. The main result is that almost all the probabilistic consistency conditions studied are equivalent. The logical relations among all these conditions are described. Recent work by A. Tversky and J. E. Russo on conditions of probabilistic consistency on the data $p(a,b)$ is shown to hold in the more general setting of this paper. *Journal abstract.*

9943. Shine, Lester C. & Bower, Samuel M. (U. Dayton) **A one-way analysis of variance for single-subject designs.** *Educational & Psychological Measurement*, 1971(Spring), Vol. 31(1), 105-113.—Illustrates the applicability of 1-way analysis of variance for a single S observed on several trials under different experimental conditions. The S is assumed to be a random generator of responses to a particular stimulus. The responses are statistically independent and normally distributed. The 1-way design is handled as a 2-way design with 1 observation/cell. A modified error term for testing main effects is discussed along with a statistical test based on the assumption that main effects for trials change slowly from 1 trial to the next. Schematic calculation procedures are provided.—*R. W. Covert.*

9945. Werts, Charles E. & Linn, Robert L. **Considerations when making inferences within the analysis of covariance model.** *Educational & Psychological Measurement*, 1971(Sum). Vol. 31(2). 407-416.—Discusses the applicability of analysis of covariance in naturalistic and quasi-experimental studies. The analysis of variance model is discussed in relationship to the general linear model. In standardized form, the dummy variables represent the treatments and the covariates the

regression weights. 4 possible methods for determining the proportion of variance that the categorical treatment accounts for are discussed in terms of regression analysis. The interpretation of results with respect to what assumptions have been made is presented. *R. W. Covert.*

Factor Analysis

9946. Cureton, Edward E. (U. Tennessee) **Communality estimation in factor analysis of small matrices.** *Educational & Psychological Measurement*, 1971(Sum). Vol. 31(2). 371-380.—Attempts to provide an accurate estimate of communality in the factor analysis of small correlation matrices. This estimate is especially useful when the complete centroid method of factorization is employed. A simple formula is provided and discussed for the communality estimate. 10 well-known examples of factor analysis of small matrices are provided. Results show that communalities estimates using Cureton's procedure are a more accurate estimate of the communality than the more common procedure of selecting the highest absolute r . The application of the procedure is discussed along with criteria for determining the number of factors. *R. W. Covert.*

9947. Fulgosi, Ante. (Faculty of Philosophy, Zagreb, Yugoslavia) **Prokrustino-analićke rotacije i problem kongruencije u faktorskoj analizi.** [Comparison of different analytical and procrustes rotations] *Revija za Psihologiju*, 1970. Vol. 1(2). 49-50.—Considers the problem of rotation of factor axes in factor analysis, employed as a method of hypothesis testing in a multivariate experiment. It is concluded that neither the analytical methods nor all of procrustes methods can serve this purpose.—*English abstract.*

9948. Kalimo, Eskimo. (National Pensions Inst., Helsinki, Finland) **Notes on approximate procrustes rotation to primary pattern.** *Educational & Psychological Measurement*, 1971(Sum). Vol. 31(2). 363-369.—Presents a brief review of rotation methods to a specified target matrix in factor analysis and 2 notes. The notes dealt with the approximate least squares fit to a target matrix. The 1st note suggested a direct procedure for obtaining a primary pattern, when the target matrix is a reference structure. On the basis of this result it was also concluded that the resulting primary pattern and the corresponding reference structure are in the same sense maximally similar to the target matrix. The 2nd note showed that usually numerically different but interpretatively similar primary patterns are obtained when the target matrix is a reference structure and when it is the co-responding primary pattern.—*Journal summary.*

COMPUTERS & PROGRAMING

9949. Baron, S., et al. (Bolt Beranek & Newman Inc., Cambridge, Mass.) **Development of behavioral science programming language.** *NAVAL Research & Development Command Technical Report*, 1971(1 Feb). No. 70-0006-1. 54 p.—Describes the design criteria and an implementation plan for a Behavioral Science Programming Language (BSPL) to be used for programming experiments on a computer-driven, high-performance artificial simulation facility. The BSPL was conceptualized to (a) take full

advantage of the existing hardware and software facilities, (b) be rich enough in structure to allow the programming of meaningful experiments, yet simple enough to be readily learned by the nonprogrammer; (c) be usable by individuals who do not have intimate knowledge of the simulation program, (d) be incrementally implementable, and (e) be capable of graceful expansion and elaboration. A description of the present facility, a conceptualization of a prototype experiment, and the implication of these factors for the design of the BSPL are discussed. A proposed design is presented along with an implementation plan. A formal description of the language and a sample program are included as appendices.—*Journal abstract.*

9950. Fulgosi, Ante & Gospodnetić, R. (Faculty of Philosophy, Zagreb, Yugoslavia) Program za izračunavanje transmitirane informacije na računalo IBM 1130 "TRINF." ["TRINF": An IBM 1130 program for calculating information transmission indices.] *Revija za Psihologiju*, 1970, Vol. 1(2), 51-71. Describes a program for unidimensional information transmission. The program is written in FORTRAN IV-IBM 1130 language and was developed for that machine. The program can calculate values of $H(S/R)$, $H(R/S)$, and $I(Y/X)$ from any stimulus-response event in the experimental sequence to any other stimulus-response event in the sequence as well as for the whole range of the experiment. Calculations can be for an individual S or for data pooled across 2 or more S s. Stimulus-response matrices up to dimension of 50×50 can be formed and, optionally, printed or discarded. (English abstract)—A. Fulgosi.

9951. Georgiade, Constantin. (U. Bucharest, Romania) a) *Éléments cybernétiques dans l'œuvre d'Henri Piéron.* [Cybernetic elements in the work of Henri Piéron.] *Année Psychologique*, 1970, Vol. 70(1), 161-177. Presents a survey of over 50 yr. of the work of Piéron, founder of behavioral psychology in Europe, and posits analogies among certain of his psychological conceptions and those of cybernetics: (a) gradation capacity in the nervous system, supporting the hypothesis of mathematical function; (b) different forms of behavior in lower organisms, behavior through subjection, autoconduction, and exploration; (c) the nervous system as an apparatus of behavioral direction and control; (d) the regulating function, regulation of intrapsychic and cortical origin; (e) the problem of model, information theory and its repercussions in Piéron's psychology; (f) the neurophysiologic mechanism as the foundation of sensory information, and (g) experiments on the phenomenon of transmission of arousal corresponding with cybernetics. 9953. Treu, Siegfried. (U. Pittsburgh) *Supplementing human memory by means of interactive, computer-based associative storage and retrieval.* *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-B), 6099-6100.

TESTING

9954. Cureton, Edward E. (U. Tennessee) *The stability coefficient.* *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 45-55. The stability coefficient is described as the extent to which a test

varies as the result of factors associated with the particular time and occasion on which the test was administered. A theoretical model is provided which includes not only the traditional true score and error score but also an error score due to instability. A formula for stability based on a measure of consistency is provided. 4 sets of verbal test scores are examined. The results tentatively show the instability curve to be of the inverted S type. Where instability increases slowly from 0 sec. to 2 days, then increases rapidly at the 5-day interval only to rapidly decrease at the 8-day interval.—R. H. Covert.

9955. Kane, Robert B. (Purdue U.) *Minimizing order effects in the semantic differential.* *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 137-144. 9 semantic differential strategies were produced, 8 by a previously developed computer program. 3 studies were conducted: (a) many varied vs. fixed concept order, scale order, and scale polarity; (b) few varied vs. fixed orders and polarity; and (c) concept, scale, and polarity fixed vs. concept and scale fixed but polarity varied. The responses of 180 randomly assigned undergraduates were obtained. $34 \times 14 \times 14$ product-moment matrices were computed. Each was factored and rotated to the varimax criterion. 2 factors were extracted in each experiment. Differences in factor scores for the 3 experiments are nonsignificant leading to the conclusion of no important order effect in administering the semantic differential, under the conditions of these experiments.—N. M. Chansky.

9956. Lord, Frederic M. (Educational Testing Service, Princeton, N.J.) *Robbins-Monro procedures for tailored testing.* *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 3-31. Compared the Robbins-Monro procedures having approximate harmonic sequences of step lengths with fixed step and certain hybrid procedures. The comparisons are made considering the parameters: examinee ability level, test length, item difficulty, item discriminating power, item guessing, off-set, and step size. Although only a few possible procedures and circumstances were explored, shrinking-step-size procedures were found to have certain advantages over fixed-step-size procedures. However, if more than 6 or 7 items are to be administered to an examinee, the item pool required for shrinking step-size is prohibitive. (18 ref.)—R. H. Covert.

9957. Stallings, William M. & Gillmore, Gerald M. (Office of Instructional Resources, Champaign, Ill.) *A note on "accuracy" and "precision."* *Journal of Educational Measurement*, 1971(Sum), Vol. 8(2), 127-129. The terms accuracy and precision are consistently differentiated in the literature of engineering and the "hard" sciences. Precision shares a common core of meaning with reliability as used by behavioral scientists. Accuracy and validity have a similar semantic overlap. A review of the literature in educational and psychological measurement reveals an interchangeable usage of accuracy and precision in defining reliability. To help beginning students distinguish between validity and reliability, the use of precision, rather than accuracy, in describing reliability is advocated. (19 ref.)—*Journal abstract.*

9958. Stuart, Irving R. & Murgatroyd, Dorothy. (Herbert H. Lehman Coll., City U. New York) *Field research model of the Rod-and-Frame Test.* *Perceptual & Motor Skills*, 1971(Apr), Vol. 32(2), 671-674. Field research makes size and weight demands upon

instruments which are sometimes not as important in the laboratory. A portable model of the Rod and Frame Test (RFT), which had been standardized against the original laboratory model, was considered too bulky for easy transportation as hand baggage where air travel was necessary. Another portable version of the RFT did meet portability requirements but suffered from design limitations which invalidated its results, as well as an absence of standardization data. Successful modifications of this lightweight instrument overcoming the handicaps and a successful comparison with scores on another standardized portable apparatus was made with 51 men and 97 women of college age.—*Journal abstract.*

9959. Waters, Carrie W. & Bayroff, A. G. (Ohio U., Center for Psychological Services) **A comparison of computer-simulated conventional and branching tests.** *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 125-136.—5, 10, and 15 hypothetical conventional tests with 2 difficulty ranges, .1 to .9 and .3 to .7, were evaluated as were 6 hypothetical 1-item and 4 hypothetical 2-item per stage branching tests. An underlying normally distributed ability was assumed. For the purposes of analysis biserial correlations were fixed, though varying in magnitude. With low biserials items with small spread yielded high correlations with ability for both conventional and branching tests. Wide range tests were better when high biserials were assumed. With low biserials the conventional test yielded higher r 's with the criterion than did the branching test. Higher correlations were found with 1-item branching tests as opposed to the 2-item tests.—*N. M. Chansky.*

Construction & Validation

9960. McQuitty, Louis L. (U. Miami) **Relaxed rank order typal analysis.** *Educational & Psychological Measurement*, 1971(Spr), Vol. 31(1), 33-43.—Develops and illustrates a method of classifying fallible data into and larger and larger internally consistent categories. Each set of data usually starts with 2 or more categories which are built up gradually and which combine at various levels. The classification is realized by relaxing gradually and minimally, step by step, the objective criterion of internal consistency.—*Journal summary.*

APPARATUS

9962. Davidson, Robert S., Streeb, R. David, & Bremser, Robert. (Veterans Administration Hosp., Miami, Fla.) **Modification of the Grason-Stadler experimental rat chamber.** *Perceptual & Motor Skills*, 1971(Apr), Vol. 32(2), 471-474.—Suggests several modifications of a currently popular small animal experimental chamber in the hopes of facilitating common laboratory procedures, e.g., lever insertion and removal, animal transfer, and liquid dipper operation.—*Journal abstract.*

9963. Gaillard, Jean-Michel; Simmen, Andre E., & Tissot, Rene. (U. Geneva, Psychiatric Clinic, Switzerland)

Analyse automatique des enregistrements polygraphiques de sommeil. [Automatic analysis of sleep records.] *Electroencephalography & Clinical Neurophysiology*, 1971(Jun), Vol. 30(6), 557-561. Describes a device which automatically analyzes polygraph recordings of human sleep, giving a minute by minute diagnosis of the sleep stage, along with comments and numerical results for rapid and slow eye movements, muscle tone, heart rate, and respiratory rate. The analytical device consists of an analog component, consisting of 18 analyzers (filters and discriminators) a digital component (small computer), and an interface permitting the establishment of a dialogue between the 2 previous components (in-out registers, scalars). An automatic correction of the gross results by the context and a series of logical decisions constituting the program eventually produces a diagnosis. Results are recorded step by step on a typewriter. Other applications of the device are feasible by way of a simple change in program, e.g., long-term recordings in animals (17 ref.).—*English summary.*

EXPERIMENTAL PSYCHOLOGY

9964. Hosman, Jan. (U. Stockholm) **The dimensionality of cross-modality matches.** *Reports from the Institute of Applied Psychology*, U. Stockholm, 1970, No. 6, 10 p.—4 standard continua (white noise, duration, grayness and area) were scaled by 2 variable continua (length of line and fingerspan), using the method of cross-modality matching. Ss were 8 males and 12 females with no previous experience in the method. The logs with no previous experience, standardized estimates were rithmically transformed, standardized estimates were subjected to factor analysis in order to compare the factor structure of cross-modal matches with that of free numerical assignments. It turned out that the factor matrices obtained under both conditions of scaling are highly similar, supporting the hypothesis that "anchoring on end-stimuli" is not specific for the method of free numerical assignment, but is a general characteristic of scaling methods where the S is free to specify his own unit measurement. *Journal abstract.*

9965. Hosman, Jan. (U. Stockholm) **The factor structure of magnitude productions.** *Reports from the Institute of Applied Psychology*, U. Stockholm, 1970, No. 5, 8 p.—Tested the hypothesis that number matching is an intermediate step in cross-modal equal ratio setting. 20 teenage females were Ss. Duration length of line and fingerspan were scaled with the method of magnitude production. The intercorrelations between the rithmically transformed magnitude productions were factor-analyzed and rotated to simple structure. The factor structure of magnitude productions turned out to be highly similar to that of cross-modal equal ratio settings, which does not support the hypothesis.—*Journal abstract.*

9966. Jacob, Theodore. (U. Pittsburgh) **Experimenter bias effect as a function of demand characteristics and experimenter investment.** *Psychological Reports*, 1971(Jun), Vol. 28(3), 1003-1010.—Attempted to clarify the nature of the experimenter bias effect (1961). The experimental design consisted of 2 2×2 factorial designs in which experimenter expectations and experimenter investment were each represented on 2 levels. 72 male undergraduates served as Ss and each administered the Rorschach Inkblot Test and Number Test.

mation Test to 3 or 4 other male undergraduates. The data did not reflect an EBL with either task or with any combination of experimental conditions. Findings are discussed in terms of E's inaccuracies in receiving and/or retaining the stated expectancy, E's inability in identifying the intended demand characteristics, and the unreliable nature of the EBL. (25 ref.)—*Journal abstract*.

9967. Cronin, Denise M., Spanos, Nicholas P., & Barber, Theodore X. (Northeastern U.) **Augmenting hypnotic suggestibility by providing favorable information about hypnosis.** *American Journal of Clinical Hypnosis*, 1971(Apr), Vol. 13(4), 259-264. An experiment was designed to determine the effects of transmitting information concerning hypnosis (favorable vs. no information) and E's attitude (friendly vs. nonfriendly attitude) on the following dependent variables: Ss' attitudes toward hypnosis, expectations of their own hypnotizability, objective and subjective responsiveness to hypnotic suggestions, and self-ratings of hypnotic depth.—M. V. Kline.

PERCEPTION

9968. Abravanel, Eugene. (George Washington U.) **Intersensory integration of selected spatial dimensions: Extension to an adult sample.** *Perceptual & Motor Skills*, 1971(Apr), Vol. 32(2), 479-484. The development of intersensory integration had been studied previously in 3-13 yr. old children in terms of several spatial dimensions. This research extends the study by E. Abravanel (see PA, Vol. 42 16524) of intersensory integration across visual and haptic systems with a sample of 14 undergraduates. 4 conditions of length estimation were administered, and, for 2 of them, careful observations were made of Ss' haptic perceptual activity while engaged in perceiving length. Findings indicate a convergence in levels of accuracy for 3 of the 4 intersensory conditions by 18 yr. of age. Haptic perceptual activity was not substantially different at 13 and 18 yr. of age.—*Journal abstract*.

9969. Auerbach, Carl. (Yeshiva U.) **An elementary derivation of Stevens' law and Fechner's law from first principles.** *Perceptual & Motor Skills*, 1971(Apr), Vol. 32(2), 361-362. Stevens' law is derived from the assumption that equal stimulus ratios produce equal sensation ratios and Fechner's law is derived from the assumption that equal stimulus ratios produce equal sensation differences. Both derivations use only elementary properties of logarithms. *Journal abstract*.

9970. Borg, Gunnar. (U. Stockholm) **Relative response and stimulus scales.** *Reports from the Institute of Applied Psychology*, U. Stockholm, 1970, No. 1, 7 p.—In psychology and physiology there is a need for a theory concerning interprocess comparisons. In some cases, e.g., when making interindividual comparisons between perceptual magnitudes, it is impossible or not meaningful to convert raw scores to a standard scale by using the standard deviation as the unit of measurement. A theory is presented which introduces the range of possible responses as a frame of reference. On the basis of the range and the stimulus-response function in question, relative response and stimulus scales are constructed for interindividual and other kinds of interprocess comparisons. The validity of the theory is tested by comparing correlations between variables with and without correcting according to the theory. Abundant empirical evidence is presented in favor of the assumptions.—*Journal abstract*.

9971. Dornic, Stanislav; Künnnapas, Teodor, & Bratfish, Oswald. (U. Stockholm) **Subjective similarity as a function of exposure time and short term memory.** *Reports from the Institute of Applied Psychology*, U. Stockholm, 1970, No. 9, 9 p.—Performed 2 experiments to verify the usability of the method of similarity estimation in the area of perception and short-term memory. In Exp. I pairs of simple visual stimuli were exposed for different time periods which ranged from 1-20 msec. 35 18-21 yr. old students were Ss. Similarity was found to decrease with increasing exposure time. In Exp. II with 18 (9-22 yr. old) Ss, the Ss compared the similarity of the 1st and last stimulus in a series of 7 different figures. Exposure time of 300 msec. was used in order to rule out any errors on the perceptual level. The whole series was repeated 5 times. Similarity was found to decrease with repeated presentation of the series, the difference in similarity estimates between the 1st and the last series being 20%. Probable mechanisms of the processes involved in the tasks are discussed. It is concluded that the method of similarity estimation is a highly usable measurement tool in investigations concerning visual discrimination and short-term memory. (23 ref.)—*Journal abstract*.

9972. Horiuchi, Hideo. (Wakayama U., Japan) **Effects of auditory vs. visual presentation on dot pulse counting.** *Psychologia*. In *International Journal of Psychology in the Orient*, 1970(Dec), Vol. 13(4), 203-209. Describes 2 experiments. 9 series of dot pulses (auditory or visual) were presented at 10 rates. Delayed dot pulses were presented as interfering materials. 12 Ss counted the numbers of pulses. In the binaural and binocular presentations, auditory stimuli yielded results superior to visual stimuli. In the monaural and monocular interference presentations, auditory stimuli also produced superior responses. The unisensory situation was more affected by interference materials than was the bisensory. (20 ref.)—R. D. Nance.

9973. Hosman, Jan & Borg, Gunnar. (U. Stockholm) **The mean and standard deviation of cross-modality matches: A study of individual scaling behavior.** *Reports from the Institute of Applied Psychology*, U. Stockholm, 1970, No. 3, 8 p.—Analyzed the variability of repeated cross-modality matchings to a series of stimuli. 2 hypotheses are formulated: (a) the variability arises from different units of measurement over replications; and (b) the variability arises from different exponents over replications. From both hypotheses testable deductions were made. An experiment with 10 paid undergraduates gave evidence favoring the 1st hypothesis.—*Journal abstract*.

9974. Houck, Robert L. & Mefferd, Roy B. (Veterans Administration Hosp., Houston, Tex.) **Perceptual categorization: A parallel between perceptual identification and serial learning.** *Perceptual & Motor Skills*, 1971(Apr), Vol. 32(2), 578.—As the number of cues facilitating the perceptual categorization of a stimulus list was increased the number of serial presentations required for the S to learn them decreased. 10 laboratory personnel were Ss. A striking parallel was observed between the performance curves of the serial learning task and an earlier perceptual recognition task.—*Author abstract*.

9975. Lambert, Robert M. (U. Pennsylvania) **Bisensory judgment of the value of a measurable object attribute.** *Dissertation Abstracts International*, 1971(Apr), Vol. 31(10-B), 6294.

9976. McAuley, Patrick C. (Loyola U., Chicago, Ill.) **A test of a hypothesis in the method of equal appearing intervals.** *Dissertation Abstracts International*, 1971(May), Vol. 31(11-B), 6879.

9977. Valter, Vladimir. (U. Stockholm) **Deduction and verification of a quantum psychophysical equation.** *Reports from the Institute of Applied Psychology, U. Stockholm*, 1970, No. 13, 8 p.—Assuming sensitivity of the senses to decrease uniformly towards the lower and upper thresholds from the standpoint of a fictive continuum of a scale set up on the basic sensitivity which occurs at middle stimulus levels, a difference equation which relates to the fundamental problem in psychophysics, and which is characterized as a "quantum psychophysical equation" is described. The equation determines a set of pairs of stimulus levels r and r' , where $r < r'$, between which an equal and, in a special case, a liminal subjective contrast appears. The remaining members of the equation are constants which have to be determined empirically for the given sense modality, experimental situation, selected subjective contrast, and object of measurement; the latter may be either man, animal, or in a certain sense also plants. After a formal adjustment the equation may be used to express the course of Weber's fraction within the lower and upper thresholds. The equation was verified on many classical and contemporary studies by several authors. (68 ref.)—*Journal abstract*.

Illusion

9978. Avant, Lloyd L. & Kent, Mike. (Iowa State U.) **Anchoring lines and the Mueller-Lyer illusion.** *U.S. Army Human Engineering Laboratories Technical Note*, 1970(Jul), No. 6-70, 6 p.—Using the method of pair comparisons, 10 undergraduate females judged 12 Müller-stimulus configurations comprised of horizontal Müller-Lyer (M-L) figures bordered above and below by shorter or longer anchoring lines. From the pooling model of Adaptation-Level Theory, it was predicted that perceived length of the M-L figures would be assimilated toward anchor length. Results confirm the prediction. (16 ref.)—*Journal abstract*.

9979. Avery, G. C. & Day, R. H. (Monash U., Clayton, Victoria, Australia) **Relationship between the horizontal-vertical illusions for velocity and extent.** *Journal of Experimental Psychology*, 1971(Jul), Vol. 89(1), 22-31.—Studied the horizontal-vertical (HV) velocity illusion in which an object moving vertically seems to move faster than one moving horizontally at the same physical speed. 6 experiments were conducted with a total of 65 male and 47 female paid volunteers using a stimulus display consisting of a lighted L figure and 2 points of light moving in paths parallel to the 2 bars, in an otherwise dark field. Results indicate that (a) the direction of movement (upward, downward, rightward, leftward) in each orientation was not a significant variable; (b) there was no significant effect due to the movement orientation (horizontal, vertical) used as the standard; (c) the illusion persisted when horizontal and vertical paths were equated for apparent length; (d) different functions for the length and velocity illusions occurred as the separation and overlap of the motion paths were varied; and (e) the velocity illusion did not occur when S was recumbent. Results are interpreted as showing that the HV velocity illusion is not secondary to

the HV length illusion but has independent determinants. (29 ref.)—*Journal abstract*.
